SINO-SOVIET RELATIONS. The 20th Congress of the Communist Party of the USSR was held in Feb. 1956 and 2 important issues were raised: the denunciation of Stalin and the admission that there are "many roads to socialism." The Chinese press did not comment on the Congress until early Apr., when it noted that Stalin had made some mistakes, but refused to condemn him entirely, presumably because Mao's position could be considered analogous to Stalin's. On the question of diverse patterns of socialist development, leeway in domestic policy was supported, but the need for a common foreign policy was also maintained. Thus China encouraged Poland and Hungary to assert domestic independence in the summer and early fall. However, during the Oct. Polish and Hungarian uprisings China supported the Poles, but opposed the Hungarians, the difference being that the Poles only wanted increased domestic freedom while the Hungarians threatened to leave the Communist bloc. The CCP played a major role in the negotiations and decisions made during this period of crisis. The competition and policy disagreements which led to the Sino-Soviet split may have begun at this time.

"HUNDRED FLOWERS" CAMPAIGN. The "Hundred Flowers" campaign was newly emphasized in early 1957. In a speech, Feb., entitled "On the Correct Handling of Contradictions Among the People," Mao outlined a policy for dealing with domestic dissent and reiterated the need to loosen controls over free expression of opinion. From then until late May the people were invited to express their suggestions and criticisms. Simultaneously, a national cadre rectification campaign was carried out, the implication being that the cadres were inhibiting free comment. Finally, in May and early June the response came

with both basic and violent criticism of the CCP. Its intensity apparently took the Party by surprise, threatening to undermine the whole power structure. In early June the Party retaliated with a massive "antirightist" campaign which continued into 1958. In July and Aug. there were widespread arrests of "counterrevolutionaries." Thus the "Hundred Flowers" campaign was brought to a sudden halt.

BEGINNING OF THE SINO-SOVIET SPLIT. The fall of 1957 was another turning point in Chinese foreign policy. In late Aug. the USSR tested its 1st ICBM and agreed to help China build its own nuclear deterrent. Early the following month the 1st sputnik was launched. Then in early Nov. Mao made his 2nd trip to the USSR and met with the world's other Communist leaders. In a speech at one conference Mao maintained that the Russian scientific achievements gave the Communist world a strategic advantage which should be pushed immediately. He insisted that "the east wind prevailed over the west wind," and recommended aggressive action. The Russians apparently disagreed, cautioning against the dangers of nuclear war with the U.S. This basic strategy disagreement has persisted ever since and from it has developed the Sino-Soviet split, the Chinese accusing the Russians of holding "revisionist" attitudes toward "imperialist" states and the Russians accusing the Chinese of being unrealistic about the possible alternatives in the nuclear era. The theoretical question involved is said to turn on the inevitability of war.

1958

THE "GREAT LEAP FORWARD." In the early months of the year the anti-rightist and rectification campaigns continued and violent attacks on Yugoslav "revisionism" were made. (The latter were veiled criticisms of the USSR.) Then, in the summer, China launched a radically new program for speeding industrial development, abandoning the Soviet model and initiating the Great Leap Forward. The co-operative movement had been growing since 1952 and

now the co-operatives were merged into multifunctional communes, averaging about 5,000 households each. The administration of each commune was responsible for the political, economic, and military organization of its members. Land was owned by the commune, but for production purposes the communes were subdivided into brigades (equivalent to the old co-operatives) and teams (equivalent to the old mutual-aid teams). In the movement's early stages communal living was encouraged with the establishment of central mess halls, child-care centers, etc. Although wages were paid, there was an effort to implement a free supply system based on the Communist precept "to each according to his needs." In addition to agriculture, the communes were expected to undertake industrial production. The small-scale steel plants established at this time have become a symbol of the economic disaster that the Great Leap brought.

Much of the commune movement apparently began without the specific orders of the top Party leaders, and in early Aug. Mao reportedly toured the communes to inspect the results. On his return, an important Party conference was held at Peitaiho and the communes were declared the best form for socialist construction and the transition to Communism. In the following months, as the movement spread, claims were made that China was rapidly approaching Communism (having outdistanced the Soviet Union in this respect) and had now become the true leader of the Marxist-Leninist revolution throughout the world. However, by late Nov. another Party conference seriously reviewed the movement and began to restrain it, announcing that the transition from socialism to Communism was in the very distant future. Economic dislocations had already become evident as a result of uneconomical production methods, particularly with reference to modern industry, and the crash programs implemented by the communes.

2ND TAIWAN STRAITS CRISIS. Simultaneously with the height of the Great Leap there occurred the 2nd Tai-

wan Straits crisis, which began in Aug. 1958 and was virtually over by Oct., but which was much more severe than the earlier one. The Communists blockaded one of the offshore islands and then extended their territorial limit to 12 mi. in order to cut off supplies. The U.S. refused to recognize the 12-mi. limit, escorting supply ships to the conventional 3-mi. limit and breaking the blockade. On 6 Sept. Chou En-lai offered to resume talks with the U.S. in Warsaw and in early Oct. the shelling of the island was temporarily halted. The USSR did not protest U.S. actions until after 6 Sept., suggesting that it was unwilling to support Chinese militancy. Thus the Chinese were forced to back down in the face of superior U.S. strength and new fuel was added to the smoldering Sino-Soviet dispute.

1959-61

REBELLION IN TIBET. In Mar. 1959, with the Tibetan rebellion, the regime faced the 1st serious threat to the unity of the Chinese state since it came to power in 1949. The revolt was speedily crushed and the Dalai Lama sought asylum in India. Because of his presence there, Apr., the Chinese accused India of expansionism and interference in Chinese internal affairs. By fall, border clashes which continued through Dec. began to occur between Indian and Chinese troops. Perhaps the most significant aspect of the conflict with India was the lack of support China received from the USSR, which apparently again refused to underwrite Chinese militancy. It was learned later that in 1959 the Russians had also abrogated their nuclear-aid agreement with China. This had serious implications for future Chinese security and further intensified the dispute with the USSR.

PROMOTION OF LIU SHAO-CH'I. At the 2nd National People's Congress, Apr. 1959, Mao was not re-elected chairman of the PRC, although he continued to head the Party. Instead, Liu Shao-ch'i was named to the post, implying that he would later succeed Mao as the most important leader of China.

MODIFICATION OF THE COMMUNE POLICY. From June 1959 onward, retreat from the excesses of the Great Leap became evident. Decentralization was urged for some aspects of commune work, the free supply system was limited, and efforts to develop small-scale modern industry in the agricultural setting were scrapped. In Aug. and Sept. announcements were made of deflated production statistics for 1958, thus discrediting the exaggerated claims for the "Great Leap Forward," and scaled-down targets were belatedly announced for 1959. However, the official explanation of economic setbacks caused by the Great Leap was that China suffered serious droughts and floods between 1959 and 1961, and in the last part of 1959 a campaign against the "rightist" critics of the Great Leap was waged.

RENEWED EMPHASIS ON AGRICULTURE. The retreat from the Great Leap was even more obvious in 1960. On 1 Jan. an article in the Party journal *Red Flag* announced that agriculture would be the foundation for economic growth during the year. (During the Great Leap, industry had been given priority.) A 12-year National Agricultural Program was ratified, Apr., and during July and Aug. a nationwide campaign to make agriculture the basis of the economy was conducted. Decentralization in the communes to increase popular enthusiasm and encourage better management was begun. Despite reorganization of rural communes, in Mar. and Apr. urban communes to organize neighborhood industry, household services, and welfare projects were promoted. However, it was stressed that most property would remain private and participation would be voluntary.

ARMY POLICY. Early in 1960 there was a move to prepare the militia to assume an economic role and a stress on the possibilities of a successful "people's" war against other states with highly developed weapons. (The latter was probably related to the Soviet withdrawal of nuclear aid.) In Oct. Defense Minister Lin Biao began to stress political indoctrination for the army, foreshadowing the nationwide campaigns of the following years.

SINO-SOVIET SPLIT. During 1960 the Sino-Soviet dispute became public. *Red Flag* articles, Apr., asserted that tactical maneuvers by imperialists did not change imperialism's basic nature and that so long as imperialism existed wars were inevitable. The Russians maintained that some wars could be avoided. In June, at a Conference of Communist Parties in Bucharest, a violent, personal exchange occurred between the CCP representative and Khrushchev, each accusing the other of poor judgment. In July the USSR withdrew all its experts and aid from China.

INCREASE IN FOREIGN ALLIANCES. As the Sino-Soviet dispute intensified, so did competition for allies in the Afro-Asian states. As a series of African states became independent in 1960, China quickly recognized them. (This was also part of China's effort to deprive Taiwan of votes on the China issue in the UN.) In Jan. the instruments of ratification for the Sino-Indonesian Dual Nationality Treaty signed in 1955 were finally exchanged, and a Treaty of Friendship and Mutual Non-Aggression was signed with Burma. Boundary and aid agreements with Nepal, Mar., a Friendship and Non-Aggression Treaty with Afghanistan, Aug., and a boundary treaty with Burma, Oct., were also signed. One desired effect of these agreements was to isolate India from her neighbors.

ECONOMIC DECENTRALIZATION. A Party meeting in Jan 1961 announced the virtual abandonment of Great Leap economic policies. Between Jan. and June 1961 the value of the experience of old peasants, the importance of rural trade fairs to the economy, and the necessity of private plots and individual family sideline enterprise to supplement the collective economy were all stressed. By June decentralization of production decision-making to the team level had apparently been accepted. All of these trends indicated a reversion to co-operatives and in some cases mutual-aid-team levels of co-operation. Starting in Sept. there were campaigns to increase production and quality in light industry and to improve standards and systems of accounting in all enterprises.

A further deterioration in Sino-Soviet relations took place when Khrushchev made a violent attack on the Albanians at the 22nd Communist Party Congress of the USSR in Oct. Chou En-lai, who headed the CCP delegation, criticized the attack and then left the meetings.

During the year contacts between Japan and the PRC grew, particularly in the field of trade.

1962-65

SOCIALIST EDUCATION CAMPAIGN. Efforts for economic stabilization and commune decentralization continued in 1962. In the early months of the year there was also evidence of a new emphasis on Party discipline and effectiveness, but it was not until a Party conference in Sept. that this was clearly defined. With Mao presiding and delivering an important speech on class struggle, the conference marked the beginning of a nationwide effort to strengthen support for the regime and rectify Party work styles in order to guarantee the continuation of the revolution. At the conference the Party decided to conduct a Socialist Education Campaign and afterward several local ones were begun experimentally in the rural areas. Their results showed that, since the failure of the Great Leap, the rural population had increasingly reverted to "capitalist" forms such as private plots and individual marketing. Many had left farming for more lucrative jobs in business. The cadres had lost their revolutionary zeal to the point of being unable to control, and in some cases even encouraging, these tendencies. In short, the revolution was at stake.

CONFLICT WITH INDIA. In mid-Apr. 1962 the border conflict with India was renewed with each side accusing the other of aggression. By Oct. there was fighting between Chinese and Indian troops. The USSR continued military aid to India throughout, earning new denunciations from the CCP. The Russian handling of the Cuban missile crisis in the fall was especially criticized. On 1 Dec. China announced that her troops would withdraw from the Indian border unilaterally. They did conduct a partial

withdrawal, but remained in what had been considered Indian territory.

IDEOLOGICAL REFORM CAMPAIGNS. Although the Socialist Education Campaign was not openly discussed until late in 1963, political drives which were related to it were begun. Socialist indoctrination for everyone was stressed with the dual goal of increasing class consciousness and collective production enthusiasm. One of the basic techniques was to make people compare their present lives with how they had lived before the Communists took over and to recall how they had suffered at the hands of the "exploiting classes." Early in the year a campaign to emulate the self-sacrificing spirit of an army martyr named Lei Feng was carried out. By June cadres were being urged to participate in physical labor to increase their ties with the general population.

In Sept. 1963 it was announced that the economy had recovered from the "natural disasters" of 1959-61.

INTERNATIONAL RELATIONS. Although China announced in Mar. that its withdrawal from Indian territory was complete, tensions along the Sino-Indian border were increased that month when the Dalai Lama announced a new Tibetan constitution to be implemented after the Chinese were driven out of Tibet. Efforts to isolate India continued as China signed new boundary agreements with Nepal, Jan., Pakistan, Mar., and Afghanistan, Nov. In 1965 the Chinese issued an ultimatum demanding Indian withdrawal from "Chinese" territory, but they later backed down.

The main preoccupation of Chinese foreign policy during 1963 was the dispute with the USSR and competition for leadership of the world Communist movement. As the U.S. and the USSR approached agreement on a partial nuclear test ban, Chinese accusations of Soviet "revisionism" became increasingly violent. Talks held in Moscow, July, between Soviet and Chinese Party leaders led nowhere. When the treaty was signed, late July, the Chinese condemned it and in the following months bitter personal attacks were leveled at Khrushchev in an effort to undermine his leadership.

EXPANSION OF THE SOCIALIST EDUCATION MOVEMENT. Efforts to increase socialist consciousness and collective production enthusiasm and improve cadre work styles were continued in 1964 while the Socialist Education Movement was considerably expanded. At various times nearly every other campaign was said to be part of this general one. In Jan. 1964 a nationwide production drive was launched in industry and commerce, called the campaign "to compare with, learn from, and overtake the advanced and help the backward." At the same time a movement to "Learn from the PLA" (the Chinese army) was begun. The political indoctrination which had been carried out in the army since 1961 was held up as an example for the rest of the country as all were urged to study Mao's works. By fall, the Socialist Education Movement had been extended to the cities and a new attack on intellectuals who allegedly denied the necessity of continuing class conflict was launched.

RELATIONS WITH THE USSR. Verbal attacks on the USSR intensified in the first half of 1964. When Khrushchev proposed, June, a meeting of all Communist parties, the Chinese called it an effort to further split the Communist movement by attacking the CCP. Khrushchev's unwillingness to give up his plan exacerbated the dispute and probably also contributed to his removal from power in mid-Oct. Then, 16 Oct., the PRC exploded its first atomic bomb, thereby gaining considerable international prestige and increasing China's bargaining power with the USSR. Since Soviet aid for Chinese nuclear development had been withdrawn in 1959, the Chinese could take much of the credit for the obvious technological advance. After these 2 events the dispute temporarily subsided. In Nov. Chou En-lai led a delegation to Moscow and Khrushchev's fall was hailed in the Chinese press as a great victory for Marxism-Leninism against "revisionism."

RECTIFICATION CAMPAIGNS. In Jan. 1965 Mao apparently personally ordered a reorientation of the Socialist Education Movement to deal with the few people in the Party who had been

influenced by capitalism. In spite of this, the tendency to expand the campaign continued. For instance, national conferences on conducting political work in industry and communications and in agriculture and forestry were held. Rural and urban part-work, part-study schools whose programs were to be co-ordinated with the local socialist education campaigns were promoted. Thousands of people (particularly students) were sent into the countryside to help with the various campaigns and to gain an increased commitment to socialism in the process. By fall cadres above the basic levels were being held responsible for the morale problems lower down in the scale. A campaign to rectify county Party officials resulted. They were accused of enjoying a soft life, ignoring Party policy, and losing contact with real situations. The following year it was revealed that many cadre members had lost their posts during this period. Also in the fall, another campaign was begun among the intellectuals. Various writers were accused of allegorically opposing the regime. From these 1st criticisms in Nov. and Dec. the Cultural Revolution developed.

FAILURE OF THE 2ND AFRO-ASIAN CONFERENCE. The pause in the Sino-Soviet dispute was only temporary. In mid-Feb. 1965 Kosygin, the new Soviet premier, visited Peking. Shortly thereafter, the Chinese again began to comment on Soviet "revisionism" and, late May, accused Khrushchev's successors of continuing his line, only more subtly. The 2nd Afro-Asian Conference, the successor to the one held in Bandung in 1955, was scheduled to be held in Algeria in mid-1965. When the issue of Soviet participation arose, the Chinese were strongly opposed. Ultimately, the conference was "indefinitely postponed."

RELATIONS WITH INDONESIA. By 1965 the Afro-Asian states were seriously reconsidering their relations with China. The failure of the Great Leap, the militant Chinese stand on war, the Sino-Soviet split, and the confrontation on the Indian border had all engendered mistrust. An attempted coup in Indonesia, mid-Sept., in which Chinese Communists

were implicated, was a final blow to the "peaceful coexistence" image. From this time, Indonesia, which had been one of China's firm supporters, began to harass Chinese in Indonesia until, 1967, diplomatic relations were suspended.

1966-68

START OF THE CULTURAL REVOLUTION. By early 1966 frequent references to the Socialist Education Campaign had ceased, but the political indoctrination campaign became even more massive. The slogans "Bring Politics to the Fore" and "Study Mao's Works" were nationally adopted. The "little red book," *The Quotations of Mao Tse-tung*, which was to become the symbol of the Red Guard, began to be generally distributed. Attacks on leading writers grew in number and severity. Their writings were condemned as "poisonous weeds" which advocated a return to the capitalist system and the overthrow of the regime. In mid-Apr. 1966 the 1st references to the Great Proletarian Cultural Revolution began to appear. They seemed to refer initially to the campaign against writers, but by June university faculties and Party personnel were also coming under fire. In mid-June university enrollment was postponed.

LIN PIAO AND THE RED GUARDS. Liu Shao-ch'i figured prominently as a leader of the movement until the Party conference in early Aug. over which Mao presided. The conference adopted a decision on the Cultural Revolution which stressed that the main problem was to purge the Party of a few members who had "taken the capitalist road." After this, a series of mass rallies was held in Peking with Mao often presiding. Defense Minister Lin Piao (b. 1908) usually appeared with him and, although Liu Shao-ch'i was generally present, he stayed in the background. By mid-Aug. Lin Piao was credited with correctly interpreting Mao's works and Red Guard units made up of teenagers were being formed on a national scale. The Red Guards, with the regime's blessing, temporarily ran wild, changing road

and store names to more "revolutionary" ones and attacking and humiliating people for having "bourgeois" household goods or clothing. However, by early Sept. there were efforts to curb these excesses, the Red Guards being cautioned to use reason rather than force.

INTERNATIONAL RELATIONS.

While the Cultural Revolution raged domestically, Chinese foreign relations steadily deteriorated. In Jan. 1966 both Dahomey and the Central African Republic broke diplomatic relations with the PRC. In Feb. the Chinese embassy in Indonesia was attacked and the Cuban regime was accused of being anti-Chinese. In Mar. the Chinese refused to attend the 23rd Russian Communist Party Congress and in Oct. Ghana suspended diplomatic relations with the PRC. During Dec. the Chinese began to put pressure on Macao, accusing the Portuguese authorities there of atrocities.

EFFECTS OF THE CULTURAL REVOLUTION. In 1967 the stability which had characterized the CCP for so long seemed to have completely broken down as the Cultural Revolution broadened and deepened, spreading to rural areas as well as cities and including more and more people. In the course of the year some of the Party's oldest and most powerful leaders, notably Liu Shao-ch'i, were denounced, but some subsequently reappeared without seeming to have lost their positions. Revolutionary committees to conduct the Cultural Revolution were set up at all levels of society and in the early months of the year they were urged to seize power from those following the capitalist road. This seemed to imply that the regime was trying to circumvent the Party apparatus. "Economism," encouraging production but overlooking politics, was attacked. By May there were reports of fighting in several provinces as Maoist and anti-Maoist factions apparently struggled to gain control. This continued sporadically through Sept. In that month Mao toured several provinces and afterward the Cultural Revolution seemed to slacken. Fighting broke out again, however, in a number of provinces in Dec. 1967, and

continued through the summer of 1968. During this period the anti-Maoist faction continued to be purged. By the summer 34 of 63 active members of the 1965 Central Committee of the CCP had been removed, and 9 had been publicly criticized. Of 72 active alternates to the Central Committee, 27 had been purged and 29 publicly criticized, while only 9 of the 45 1st and 2nd secretaries of regional party organizations were still active. On 31 Oct., 1968, the Central Committee announced that Liu Shao-ch'i, earlier labeled as "the top Party person in authority taking the capitalist road," had been removed from his post as chief of state.

INTERNATIONAL RELATIONS.

During 1967 pressure on Macao continued and a similar campaign against the British in Hong Kong was begun in the late spring. Diplomatic incidents involving many countries which had previously been relatively sympathetic toward China occurred. These ranged from a near rupture of relations with Britain over physical attacks on British diplomatic personnel to a squabble with Ceylon over the distribution in that country of Mao buttons. In 1968 the pressure against Hong Kong continued, and relations with India further deteriorated because of alleged Chinese assistance to the Naga rebels.

THE REPUBLIC OF CHINA (TAIWAN)

1949

LOSS OF THE MAINLAND. The Communist armies moved south from Manchuria in early Jan., forcing negotiations for the surrender of Peking. On 21 Jan. President Chiang Kai-shek announced his retirement from office and made Vice-President Li Tsung-jen (b. 1890) acting president. In the following months other major cities fell to the Communists. In mid-Oct. the Nationalist government was moved from Canton to Chungking, but in late Nov. Chungking also fell. In early Dec. Li Tsung-jen left for the U.S.A., the seat of government was moved to Taipei,

Taiwan, 7 Dec., and Chiang himself fled to Taipei.

Although the Nationalists now ruled the equivalent of only 1 Chinese province, the national structure of government was maintained. Government practice has since remained static; in spite of democratic forms, the real decisions are made by Chiang and his advisers, the provincial administration is mainly staffed with Nationalist refugees rather than Taiwanese, and public expression of opinion is tightly controlled. While this has created certain problems for the regime, thus far Chiang's power has not been seriously challenged and attention has been focused on economic development and foreign relations, especially the recovery of the mainland.

1950-53

THE KOREAN WAR. In Jan. 1950 the U.S. denied any commitment to the defense of Taiwan, and on 1 Mar. Chiang resumed his duties as president in Taipei. By late spring Communist troops were massing on the Chinese coast opposite Taiwan in preparation for invasion, but the Korean War broke out before the invasion was begun, causing President Truman to announce in late June that the 7th Fleet would neutralize the Taiwan Straits. In exchange, the Nationalist government agreed not to try to retake the mainland.

U.S. support for Taiwan continued during the next few years. In Jan. 1951, military aid to the Nationalists was resumed. In the following May, the U.S. said that it would aid Taiwan and refuse recognition to the Communist regime.

In Dec. 1951 a Taiwan Provincial Assembly was set up, but it has never exercised real power. Li Tsung-jen continued to claim the presidency, but in Jan. 1952 he was impeached *in absentia* for violating the nation's laws and was ousted from the Nationalist Party (KMT).

In the early months of 1952 there was a dispute between the Nationalists and the Burmese over Nationalist forces who had

escaped into Burma and were using it as a safe base for operations against the Communists. Burma, fearing Communist retaliation, attacked these forces.

After President Eisenhower took office, he stated in early 1953 that the 7th Fleet's neutralization of the Taiwan Straits would be ended. With U.S. aid Taiwan was developing economically and it was felt that the neutralization protected the Communists more than the Nationalists. However, the decision was never implemented.

1954-55

1ST TAIWAN STRAITS CRISIS. In Mar. 1954 Chiang won his 2nd 6-year term as president. The following Aug. Communist Premier Chou En-lai called for the "liberation" of Taiwan, initiating the 1st Taiwan Straits Crisis, which lasted into 1955. Tensions in the Straits increased in the following months and on 3 Dec. the Nationalists signed a Mutual Defense Treaty with the U.S. which committed the U.S. to the defense of Taiwan and the Pescadores Islands. In Jan. 1955 it was noted that, by the defense treaty, the Nationalists agreed not to attack the mainland without previous U.S. approval. The UN Security Council voted, Feb., to discuss a cease-fire in the Taiwan Straits and to invite the Communists to participate. When the Communists refused the invitation, UN efforts were abandoned. The same month the Tachen Islands, which were difficult to defend because of their distance from Taiwan, were evacuated by the Nationalists with the help of the U.S. 7th Fleet. However, the Nationalists pledged continued defense of the other islands. By spring the crisis was passing as the Communist regime offered to negotiate with the U.S.A. on the Far Eastern situation.

1956-57

ECONOMIC POLICY. Although there were still guerrilla efforts to infiltrate the mainland and the ultimate goal of return was not renounced, from 1956 the Na-

nationalists appeared to concentrate increasingly on economic development. The 1st 4-year program for development ended in 1956 and the 2nd began in 1957. By 1957 U.S. economic and technical aid since 1949 had exceeded \$770 million. Public criticism of the administration indicated some relaxation of censorship.

In June 1956 Chou En-lai's offer to negotiate directly with the Nationalists over Taiwan's "peaceful liberation" was quickly rejected. In May 1957 there were anti-U.S. riots in Taipei and the U.S. embassy was burned after an incident involving the killing of a Chinese by a U.S. serviceman.

1958

2ND TAIWAN STRAITS CRISIS. By 1958 Taiwan's economy had progressed considerably, but it remained dependent on U.S. aid, which since 1949 had exceeded \$1 billion. New strains were put on development in the summer when the 2nd Taiwan Straits Crisis began. The Communists blockaded Quemoy, one of the offshore islands, in late Aug., whereupon the U.S. reaffirmed its commitment to the islands as they related to the security of Taiwan. When the Communists declared, Sept., that their territorial waters extended 12 mi. from their shores (including Taiwan) instead of the usual 3 mi., the U.S. responded by escorting supply ships for Quemoy to the 3-mi. limit. This continued for a month, after which the Communists temporarily suspended the shelling of the island and then resumed it on alternate days. The problem was not solved, but the peak of the crisis had passed.

1959-64

ECONOMIC DEVELOPMENT. After 1959 Taiwan's economic development proceeded rapidly, achieving an annual growth rate of 6% by 1964. In 1959 a 10-year development program was outlined, and by 1964 the government had apparently shifted its emphasis from militarily recovering the mainland to attracting the

mainland Chinese through economic prosperity.

Although guerrilla activities and some shelling of the offshore islands continued, there was only 1 major build-up of Communist forces opposite the Nationalist-held islands, mid-1962.

INTERNATIONAL AFFAIRS. Competition between the Communists and the Nationalists for support in Africa grew as it became clear that African nations could control the crucial votes on the question of Communist China's admission to the UN, which had become increasingly closely contested in the early 1960's. The Nationalists used aid, trade, and personal diplomacy to gain support among the African states and were relatively successful. One setback occurred in Jan. 1964, when France forced Taiwan to break diplomatic relations by denying that the Nationalists represented China in Paris.

TAIWANESE INDEPENDENCE MOVEMENT. During this period there were renewed efforts by the Taiwanese to gain independence from Chinese rule, or at least increased democracy, but little progress was made. In 1960 Taiwanese parties agitated for a place on the ballot in local elections. Fearing the formation of a united Taiwanese Party (the China Democratic Party), the KMT sought a coalition with 2 other Chinese parties, the Democratic Socialists and the Young China Party. The government said it would not recognize the new party if it were formed. Then, Sept. 1960, a publisher who was a leader of the new party was arrested for sedition and given a long prison sentence. Oct. The controversy continued into 1961 and 1962, and opposition leaders were arrested. The movement did not keep Chiang from being elected for a 3rd presidential term, Mar. 1960.

1965-68

U.S.-TAIWAN RELATIONS. A major turning point in U.S.-Taiwan relations was reached in 1965, when in July it was announced that U.S. economic aid was being phased out. In Aug., after over a

decade of negotiation, a Status of Forces Agreement was reached between the 2 states providing for Nationalist jurisdiction over crimes committed by U.S. servicemen in Taiwan.

The economy was aided by U.S. purchases in Taiwan for the Vietnam War. The Nationalists strongly supported the war, but were not asked to contribute troops because of the implications it might have for Communist Chinese involvement.

RE-ELECTION OF CHIANG. Chiang's position remained secure. In 1965 one of the leading advocates of Taiwan's independence returned there from Japan calling for unity in opposition to the Communist mainland regime and consequently weakening the independence movement. In Mar. 1966 Chiang was elected, at the age of 79, to a 4th 6-year term as president.

JAPAN

1915-46

SURRENDER. Japan formally surrendered on 2 Sept., 1945, aboard the battleship *Missouri* anchored in Tokyo Bay. Gen. Douglas MacArthur and Foreign Minister Shigemitsu Mamoru were the principal signers. Shortly before this, MacArthur had landed in Japan as the Supreme Commander for the Allied Powers (SCAP). It soon became clear that the Japanese were stunned and disillusioned and wished genuinely to co-operate with the occupation forces. Moreover, they were impressed by the occupation's constructive goals: the elimination of militarism in Japan, the guaranteeing of human rights, and the achievement of basic democratic reforms.

1ST OCCUPATION MEASURES. On 4 Oct., 1945, SCAP published what has been called the Japanese Bill of Rights. It abolished laws restricting human rights, ordered the release of political prisoners, and deprived the Home Ministry of many of its powers. State Shinto was disestablished. A Trade Union Act gave workers the right to organize. On 1 Jan., 1946, the

emperor published a rescript denying his divinity.

PROMULGATION OF THE CONSTITUTION. Premier Shidehara Kijuro (1872-1951) formed a commission to draft a new constitution. The resulting draft was presented to SCAP on 1 Feb., 1946. SCAP found it too conservative, and MacArthur immediately ordered the Government Section of his General Headquarters to draft another. The new draft, written at a feverish pitch, was presented to the Japanese cabinet on 13 Feb. SCAP representatives and the cabinet discussed it for 2 exhausting days, and a partial revision was made. On 6 Mar. the draft constitution was published with the strong endorsement of the emperor and of SCAP.

One reason for MacArthur's haste was fear of interference from the Far Eastern Commission (FEC). The FEC was an 11-nation body sitting in Washington, formally charged with establishing occupation policy. It met for the 1st time on 26 Feb., 1946. But MacArthur maintained his autonomy in the matter of the constitution, as in nearly everything else. In Nov. 1946 the constitution was approved nearly intact by the Diet. It became effective, 3 May, 1947.

PROVISIONS OF THE CONSTITUTION. The new constitution abolished the fiction that the emperor was the actual head of the government and placed genuine responsibility on the Diet and the cabinet. The Diet is supreme. It consists of the House of Councilors and the House of Representatives. Both are elected, but the latter is clearly stronger. The House of Councilors has 250 members who sit for 6 years; 60% of them represent prefectures, while 40% are elected by the nation at large. The House of Representatives has 467 members from 118 electoral districts, elected for 4 years each. The Diet elects the premier from among its members. It originates constitutional amendments. In legislative and budgetary matters, the representatives can overrule the councilors.

Although the constitution is unclear on the issue, it is agreed that the head of state is the premier. The emperor is

described as the "symbol of the State and of the unity of the people," deriving his position from the will of the people with whom resides sovereign power. A Supreme Court is established to run the judiciary and to pass on the constitutionality of laws. The rights of the Japanese people are defined clearly and in detail, even to the optimistic "right to maintain the minimum standards of wholesome and cultured living." No form of discrimination based on sex is recognized. Lastly, Art. 9 specifies that Japan "renounces war as a sovereign right of the nation." This article was added with MacArthur's backing.

1946-48

DOMESTIC POLITICS. The 1st postwar elections—the 1st in Japan's history under universal adult suffrage—were held in Apr. 1946. The contending parties were the Liberals, the Progressives, the Social Democrats, and the Communists. Postwar political freedom had allowed the Japanese Communist Party (JCP) to become very active. One of its top leaders, Nosaka Sanzo (b. 1896), had returned from refuge in China to promote his own "peaceful revolution" line. The JCP obtained 5 seats, although its influence outside the Diet was stronger than this. The Social Democrats, who represented labor and urban intellectuals, won 93 seats. The Progressives, a conservative party descended mainly from the prewar Minseito and led by Shidehara, obtained 94. The Liberals, who came from the old Seiyukai, gained 139 seats. Shidehara was obliged to resign in favor of the Liberals' president, Yoshida Shigeru (b. 1878). Yoshida, a former diplomat, had escaped being purged because of his pro-peace stand during the war. Now he faced grave inflation, scarcity of food, and economic disruption, as well as the difficulty of dealing with SCAP. Labor discontent mounted and a massive strike planned for Feb. 1947 was only averted by last-minute fiat from MacArthur. In the elections of Apr. 1947, the Liberals obtained only 132 seats, and Katayama Tetsu (b. 1887) became premier at the head of a Socialist-

Conservative coalition. However, he could not put his economic policies into effect over conservative opposition. In Feb. 1948 he resigned and was replaced by Yoshida.

REPARATIONS. Basic occupation policy required the exaction of reparations, and yet Japan was obviously unable to pay any. In the end the U.S. renounced any claim, while some surplus industrial facilities were distributed among 6 allied nations, especially China.

WAR CRIMES TRIALS. For the trial of suspected war criminals, a military tribunal was set up in each major area where Japanese troops had operated. In Tokyo, 28 major war criminals including former premiers Tojo, Koiso, and Hirota were tried by the International Military Tribunal for the Far East. The trials began in May 1946 and the sentences were handed down in Nov. 1948. Seven of the defendants were hanged.

LAND REFORM. In Oct. 1946 the Diet passed 2 radical land-reform bills sponsored by SCAP. Before the war, 46% of the land had been cultivated by tenants. The land reform reduced tenancy to 10% and placed the remaining tenants in a far more advantageous position than before. Absentee landlords were obliged to sell most of their land to the government for resale to their tenants on easy terms. Owner-cultivators were restricted to a maximum allowable holding. The reform was completed by 1950 and brought genuine improvement in the countryside.

THE PURGES. In 1946 highly placed individuals in all fields who had been active in Japan's war effort were purged. They were removed from their positions and forced into inactivity. In 1947 the purge was expanded, striking individuals down to the local level. This stage of the purge was mechanically applied and caused much confusion, though it undoubtedly brought new blood into many organizations. By 1951 most public figures had been "de-purged" and were able to resume their careers.

REFORM OF EDUCATION. The occupation stressed eliminating prewar nationalistic ethics and instilling the democratic ideals of individual initiative,

academic freedom, and educational opportunity. The school system was decentralized and government control over it was eliminated. The pattern of elementary, secondary, and college education was modified to resemble more closely that of the U.S.A.

POLICE REFORM. In Dec. 1947 the Home Ministry, long associated with pre-war police controls, was abolished. The police were decentralized and reorganized as local, municipal, and national rural police. But such extreme decentralization gradually proved unsuitable in a small country like Japan.

ECONOMIC DECENTRALIZATION. Japan's ability to wage war had depended on her modern industry, which was controlled by the *zaibatsu*, the great family combines peculiar to Japan. Hence, SCAP felt that the *zaibatsu* bore much of the responsibility for the war and attempted to dissolve them. The biggest were in fact broken up, but U.S. policy turned against the reform before long, on the grounds that Japan needed strengthening, not further curbing.

1948-50

YOSHIDA'S 2ND CABINET. Yoshida replaced Katayama as premier, Oct. 1948. In Jan. 1949 the Liberals won the 1st clear majority in the Diet since the war. At the same time the JCP won 35 seats and 10% of the vote. Thus there appeared a trend toward polarization in politics, with conservatism clearly dominant.

Another trend was called the "reverse course": reversal of occupation reforms. Conservatives objected most to the decentralization of the bureaucracy and the police, but they also disliked the educational reforms. But public pressure forestalled several government-sponsored threats to these reforms. Occupation policy changed too. Complete political freedom had allowed leftist-directed labor agitation to become highly effective. Hence SCAP acted to restrict political activity on the part of labor and in 1949 began a drive against the JCP which ended with the banning of top JCP officials, 1950. The JCP went under-

ground for several years. The U.S. now preferred to think of Japan as an ally against the Communist threat in the Far East, and wished to end the occupation.

1950-52

THE PEACE TREATY. The outbreak of the Korean War, June 1950, strengthened the U.S. desire for peace with Japan. Already in 1947 the U.S. had tried to call a peace conference, though Soviet opposition had foiled the attempt. Negotiations for the treaty began in Oct. 1950 under John Foster Dulles. Dulles proceeded on the principle that the peace should be liberal and that Japan would of her own will prefer to join the free world. The free world allies were co-operative, but the USSR raised objections, the principal of which was that China should be represented by the regime in Peking. The San Francisco Peace Conference began 4 Sept., 1951, and 4 days later was signed by all nations attending, except the Soviet bloc. Peking was not represented. The treaty ended the state of war and the occupation, and recognized Japanese sovereignty. It also provided for a special agreement regarding Japan's security. Japan renounced all claim to Formosa, the Pescadores, the Kuriles, southern Sakhalin, and the mandated islands of the Pacific. UN trusteeship was established over the Ryukyus and the Bonin and Volcano islands.

REARMAMENT AND THE MUTUAL SECURITY PACT. From the start of the peace negotiations, Dulles encouraged Japan to rearm. Yoshida was willing, but the issue was highly controversial in Japan. The 1st step toward rearmament was the creation, July 1950, of a 75,000-man Police Reserve by directive of SCAP. In Mar. 1954 the U.S.-Japan Mutual Defense Assistance Agreement, covering equipment, goods, and services, was signed. In 1960, the Police Reserve was renamed the National Self-Defense Force with land, sea, and air arms.

Perhaps even more significant was the signing of the Mutual Security Pact in Sept. 1951, on the same day as the peace treaty. It became effective, Apr. 1952. The

pact provided for the continued presence in Japan of U.S. forces and bases, thus defending Japan against any aggressor and at the same time serving U.S. strategic interests in the Far East.

1952-54

FALL OF YOSHIDA. Yoshida and the Liberals were confirmed in power by the elections of Oct. 1952. At the same time, the JCP lost all its seats. This was the price it paid for having switched from peaceful to violent tactics, thereby antagonizing the public. The labor demonstrations and riots of May Day 1952 were the work of the JCP, and resulted in the passage of a dangerously vague antisubversive-activity law. The Socialists were also weakened, having split in half over the question of whether or not to support the peace treaty. The 2 Socialist factions together received only 111 seats. But despite success in this and subsequent elections, Yoshida began to lose ground. There was much opposition to his "1 man cabinet" style of government and to his rearmament policy. Moreover, the Korean War had given a valuable boost to the Japanese economy. When the war effort ended, July 1953, the boom flagged too, reflecting unfavorably on Yoshida.

In the summer of 1954, the passage of a new law recentralizing the police and of enabling legislation related to the Mutual Defense Assistance Agreement intensified the opposition. Then Hatoyama Ichiro (1883-1959) bolted the Liberals and formed his own Democratic Party. Hatoyama had been purged from the office of Liberal Party president, and Yoshida had taken over with the understanding that he would return control to Hatoyama as soon as possible. But Yoshida would not step down. Hatoyama's move brought Yoshida's resignation and soon won him the premiership.

1954-57

THE HATOYAMA AND ISHIBASHI CABINETS. In Apr. 1955 the Democratic Party obtained only a plurality over the Liberals, thus forcing a coalition. When

the 2 Socialist factions reunited, Oct. 1955, in the hope of making a serious bid for power, they alarmed the conservatives into merging. The result was the Liberal-Democratic Party (LDP) which has maintained control over the government to date. Under Hatoyama the Socialists reached essentially the same balance with the LDP that exists at the end of the sixties: $\frac{1}{3}$ of the seats in both houses. They have constituted a kind of perpetual opposition. This fact has driven them to resort frequently to strikes, petitions, and demonstrations in order to put pressure on the Diet from outside. The JCP has held a few seats in the Diet ever since 1955. In that year the Communists showed signs of returning to the peaceful policy of Nozaka, who came out of hiding to lead the party openly.

Japan further normalized her international position in Oct. 1956 by exchanging diplomatic representatives with the USSR and by signing a trade agreement. The territorial issue, however, was not settled, for the USSR refused to consider Japan's claim to those of the Kurile Islands that lie closest to her shores. Shortly after this agreement the USSR withdrew her veto, in force since 1952, and Japan was admitted to the UN.

In Dec 1956 Hatoyama resigned because of illness. His successor, Ishibashi Tanzan (b. 1884) lasted only 2 months before his health failed too. He was followed by Kishi Nobusuke (b. 1896).

1957-60

THE KISHI CABINET AND THE RENEWAL OF THE SECURITY PACT. Since the occupation the Japanese have been uneasy about their position in the world, often fearing harmful involvement in the struggle between the blocs. They have generally approved and yet resented Japan's dependence upon the U.S.A. Some have urged Japan to stand with her Asian neighbors for pacifism and neutrality. The government itself has preferred to restrict Japan's international role to trade. Thus in 1957 Japan responded to business pressure by relaxing restrictions on trade with Communist China.

The biggest popular drive for neutrality was the campaign in 1960 to block renewal of the Security Pact. The pact had no term, but both Japan and the U.S. felt that it needed modification. Kishi obtained some control for Japan over the purpose to which U.S. bases in the country might be put, and hoped this would be enough to ensure quiet passage of the treaty. But when the agreement was put before the Diet in May 1960, violent student demonstrations broke out. The Socialists boycotted the Diet and picketed the House of Representatives. Left alone, LDP forces ratified the treaty. This action led to huge demonstrations on 26 May and after. The public disorder was so serious that on 16 June the cabinet had to ask President Eisenhower to cancel his forthcoming visit. On 18 June the ratification took effect. Kishi resigned immediately and was replaced by Ikeda Hayato (1899-1965).

1960-68

THE IKEDA AND SATO CABINETS.

Ikeda quickly struck the keynote of his policy by promising to double the income of every Japanese in 10 years. By the late '60s Japan's prosperity suggested that his goal was not unrealistic. In Oct. 1960 occurred the sensational assassination of the Socialist leader Asanuma Inejiro (1898-1960). Asanuma was notorious for his pro-Peking leanings, which the Socialists have generally retained. The JCP has, after a violent internal struggle, rejected China and aligned itself with the USSR. The LDP's basic orientation reflects Japan's

extremely close ties, especially economic ties, with the West. However, the LDP is obliged to remain sensitive to pressure for pacifism and neutrality and for increased contacts with Communist countries.

In Nov. 1964 Ikeda resigned for health reasons. He was followed by Sato Eisaku (b. 1901), Kishi's younger brother. In Feb. 1965 Japan and the Republic of Korea signed a Treaty on Basic Relations, the crucial step toward the normalization of relations between the 2 countries. Korean-Japanese normalization had been a highly controversial issue throughout the early 1960's. In the Jan. 1967 elections, the LDP for the 1st time obtained slightly less than 50% of the vote, though it only lost 1 seat in the House of Representatives. The LDP was under a cloud due to exposure of serious corruption among its officials. However, the Socialists made no significant gains on that score. The Komeito (Clean Government Party), the party sponsored by the militant Soka Gakkai (Value Creation Society) won 5.4% of the vote in this, its 1st election.

In elections to the upper chamber of the Diet, 7 July, 1968, the Komeito continued to show its strength by gaining 4 new seats. The LDP, however, was able to maintain its majority. Premier Sato retained his hold over the LDP in party elections, 27 Nov., 1968. He pledged strong leadership in dealing with the main problems confronting Japan: regaining Okinawa, the continuation or abrogation of the American-Japanese security treaty, and student unrest.

Retreat from Empire

INDIA, PAKISTAN, AND CEYLON

1945

COMMUNAL ANTAGONISMS. On 14 June, the British government announced its intention to form an Executive Council consisting of Indian leaders, with

equal representation for Moslems and Hindus. At the suggestion of Lord Wavell (viceroy, 1943-47) a conference of Indian leaders met at Simla, 25 June. They were invited to submit nominations to the Council. The conference failed because of Jinnah's insistence that the League nomi-

nate all the Moslems, 14 July. Elections for the Central and Provincial Legislative Assemblies were announced, 21 Aug. Congress fought the election on the issue of independence, the League on that of Pakistan. Communal rioting was widespread. On 19 Sept., Wavell announced his intention to call a constitution-making body. In the Central Assembly elections, Nov.-Dec., the League won all the Moslem seats and Congress all the open seats.

1946

ALL-INDIA INTERIM GOVERNMENT. In the provincial elections, Jan.-Apr., Congress won 80% of the general votes cast, and the League 74% of Moslem votes cast. A British cabinet mission arrived, 23 Mar., talked with leaders, and convened a conference at Simla for 5 May, hoping to induce agreement to co-operate on constitutional progress. The conference broke down, 12 May, and the mission published its own plan, 16 May, proposing (1) an all-India interim government; (2) the grouping together of provinces desiring it, with their own legislatures and executives; (3) a decentralized federal system; and (4) the election of a Constituent Assembly. Both the League and Congress accepted these proposals, but interpreted them differently. In June both agreed to work in the interim government. Wavell formed a caretaker government, 29 June. Claiming Congress did not accept the mission plan, the League withdrew its own acceptance, 29 July, and named 16 Aug. "Direct Action Day," which was marked by riots and several thousand deaths in Calcutta. On 2 Sept. an all-Congress interim government was sworn in, including Nehru, Vallabhbhai Patel (1875-1950), Rajendra Prasad (1884-1963) and Rajagopalachari (b 1879). In elections for a Constituent Assembly, held in July, Congress won all the open seats except 9 and the League 73 of 78 Moslem seats. After strong appeals from Wavell and Nehru, Jinnah agreed to join the interim government, 13 Oct., but kept up Direct Action and maintained the boycott of the Con-

stituent Assembly when it met, 9 Dec., amidst spreading violence.

1947

PARTITION. On 22 Jan. the Assembly adopted a resolution submitted by Nehru to create an independent republic. With the League refusing to join the Assembly and Congress threatening to leave the government if the League remained in it, the British announced, 20 Feb., that they would transfer power in India before June 1948 and appointed Lord Mountbatten (b. 1900) viceroy. After consultations in India and London, Mountbatten formulated a plan which was put to Indian leaders at a meeting on 2 June which agreed to (1) partition; (2) consultation with communally mixed provinces (Punjab, N.W.F.P., Sind, Baluchistan, and part of Assam), and their partition if their people desired it; (3) the convening of a Pakistan Constituent Assembly; and (4) independence on 15 Aug., 1947.

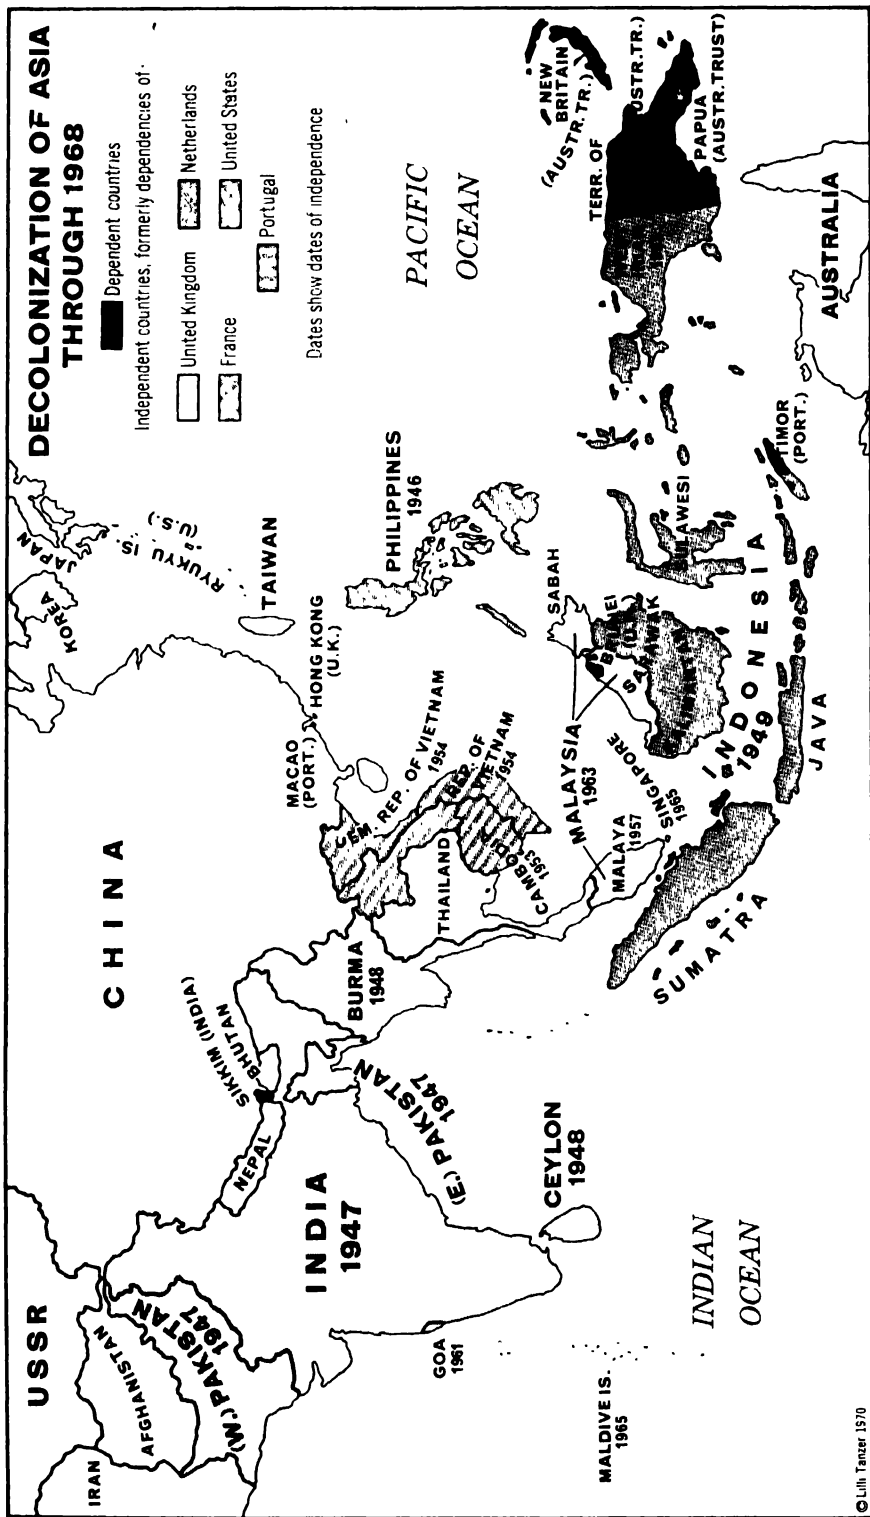

• INDEPENDENCE OF INDIA AND PAKISTAN. Under Mountbatten's guidance the subcontinent was divided between India and Pakistan. The Punjab and Bengal decided to partition themselves. A Boundary Commission delimited a provisional frontier on purely religious lines, thus splitting the Sikh area in 2, and the Sikhs turned to violence. Mountbatten convened a conference of Indian princes, 25 July, and urged them to opt for one dominion or the other. By 15 Aug., only Kashmir, Hyderabad, and Junagadh had not made their decision. Jinnah was named governor general of Pakistan and Mountbatten of India. Independence was declared, 15 Aug., in the two dominions, with millions of Hindus fleeing to India and millions of Moslems to Pakistan. Junagadh's Moslem ruler opted for Pakistan, but, his people being mainly Hindu, Nehru ordered in Indian troops, 9 Nov., and incorporated it after a plebiscite, Feb. 1948. Hyderabad declared its own independence, but was occupied by Indian troops, Sept., 1948.

INDEPENDENCE OF CEYLON. On 9 Oct., 1945, the Soulbury Commission pro-

DECOLONIZATION OF ASIA THROUGH 1968

 Dependent countries
 Independent countries, formerly dependencies of:
 United Kingdom
 Netherlands
 France
 United States
 Portugal

Dates show dates of independence

posed responsible government for Ceylon, and on 17 May of the following year Britain published a new constitution, providing for full internal self-government. After elections held Aug.-Sept. 1947, D. S. Senanayake (1884-1952) was named prime minister. Ceylon became independent in the Commonwealth, 4 Feb., 1948.

SOUTHEAST ASIA

Indochina

1945-50

RESTORATION OF FRENCH INFLUENCE. On 9 Mar., 1945, the Japanese ousted the Vichy government of Indochina and united Tongking and Annam in the state of Vietnam under Emperor Bao Dai. Cochinchina was added, 11 Aug. Bao Dai, however, was forced to abdicate, 26 Aug., and on 2 Sept. Ho Chi Minh proclaimed the Democratic Republic of Vietnam (DRV) in Hanoi, having already created a provisional Committee of the South in Saigon, which was challenged by the Cao-Dai and Hoa-Hao sects. On 12 Sept. British and Indian troops arrived south of the 16th parallel, while Chinese troops entered northern Vietnam in support of the DRV. On 23 Sept. the French, with British support, seized control of Saigon by force.

VIETMINH-FRENCH RELATIONSHIPS. On 31 Oct., 1945, Adm. Thierry d'Argenlieu arrived in Saigon as high commissioner for Indochina, and promised wide-reaching autonomy. In Nov. Ho Chi Minh dissolved the Indochinese Communist Party and formed a national government of Vietminh and Chinese-supported groups. After prolonged negotiations Ho and the French reached agreement, 6 Mar., 1946, whereby France recognized the DRV as an autonomous state within an Indochinese Federation which was itself to belong to a future French Union, and promised to withdraw French troops from the country within 5 years. French forces then entered Hanoi. At the Dalat Conference, 18 Apr.-11 May,

1946, Ho and the French failed to agree on an interpretation of the March Accords, especially the status of Cochinchina. On 1 June d'Argenlieu established Cochinchina as a state within the French Union. A conference at Fontainebleau, July-Aug., also failed to produce an agreement.

OUTBREAK OF WAR. On 23 Nov., 1946, the French bombarded Haiphong, killing several thousand persons. The Vietminh attacked the French in Hanoi, 19 Dec., and full-scale war broke out, the Vietminh troops being led by Vo Nguyen Giap (b. 1912). French reinforcements were brought in and, after heavy fighting, Dec. 1946-Feb. 1947, the French retook Hanoi. On 5 June, 1947, after long negotiations with Bao Dai, the French recognized the independence of Vietnam and its membership in the French Union by the Bay of Along Accords. On 8 Mar., 1949, the Élysée Agreements provided for the unification of Vietnam as an associated state in the French Union under Bao Dai, and agreements with Laos, 19 July, and Cambodia, 8 Nov., constituted these areas also as associated states.

1951-54

NEGOTIATIONS FOR INDEPENDENCE. On 3 Mar., 1951, the Indochinese Communist Party was reconstituted in the DRV as the Vietnam Workers' Party. A Vietminh offensive, Sept.-Oct. 1950, drove the French from northern North Vietnam, but French troops repulsed a Vietminh attack on the Red River Delta, May-Oct. 1951. In Apr. 1953 the Vietminh invaded Laos, overrunning the north and east of the country. On 13 June the king of Cambodia removed to Siam in protest against a French refusal to grant his country full independence. On 3 July the French announced plans to "complete" the independence of Indochina, and their proposals were accepted by Bao Dai, 28 Aug. A National Congress which met on 12 Oct., however, proceeded to call for independence before negotiations. A set of Franco-Laotian agreements, 23 Oct. provided for the independence of Laos.

DIEN BIEN PHU AND THE GENEVA CONFERENCE. In Jan. 1954 the Vietminh blockaded Dien Bien Phu, a strongpoint from which the French had hoped to protect Laos. By 21 July French forces had suffered 72,000 casualties, the Vietminh about 500,000, and some 250,000 civilians had died. On 26 Apr. the Geneva Conference on East Asian Affairs opened, and on 4 June France and Vietnam initialed agreements providing for Vietnamese independence. The final declaration of the Geneva Conference (not signed by any party) called for (1) the temporary partition of Vietnam at the 17th parallel, (2) the withdrawal of French troops from North Vietnam and Vietminh troops from the South, (3) the holding of elections in 1956, (4) the withdrawal of the Vietminh from Laos and Cambodia and recognition of the independence of both, and (5) the creation of an International Armistice Control Commission to supervise the arrangements made. (*Contd. p. 591.*)

Netherlands East Indies (Indonesia)

1945-49

PROCLAMATION OF THE INDONESIAN REPUBLIC. On 17 Aug., 1945, Sukarno declared the Republic of Indonesia in Batavia (Djakarta) with himself as president and Mohammed Hatta (b. 1902) as vice-president. On 28 Sept. British troops landed with orders to suppress the Republic, and on 30 Sept. the returning Dutch announced their unwillingness to negotiate with it. A series of engagements followed between allies and Indonesian forces, notably the Battle of Surabaya, Nov., in which the Indonesians held off the British for 10 days. By Dec., however, the allies controlled all of the East Indies except Sumatra and most of Java.

LINGGADJATI AGREEMENTS. On 25 Nov., 1946, after prolonged negotiations, the Dutch and Indonesians signed the Linggadjati Agreements, by which (1) the Dutch recognized the Republic of

Indonesia as the *de facto* government of Java and Sumatra, and (2) a United States of Indonesia was to be set up, consisting of the Republic and East Indonesia, which would form a union with the Netherlands. The 2 sides interpreted the Linggadjati Agreements differently, and they were not ratified until 25 Mar., 1947.

1ST "POLICE ACTION." On 20 July, 1947, the Dutch, dissatisfied with the Indonesian interpretation of Linggadjati, resorted to arms. On 30 July India and Australia took the Indonesian case to the UN Security Council, which set up a Consular Committee, 25 Aug. (replaced by a Good Offices Committee, Sept.), to oversee a cease-fire and work toward a definitive solution. The Dutch continued their advance and created new "states" in areas brought under their control. On 17 Jan., 1948, the Good Offices Committee was able to arrange the Renville Agreements between the Dutch and Indonesians and a truce was agreed.

2ND "POLICE ACTION." A Communist-inspired rebellion, Sept. 1948, was suppressed by the Republic, Nov., but the Dutch and Indonesians continued to disagree over the distribution of power between the proposed United States of Indonesia and the proposed Union. On 18 Dec. the Dutch denounced the truce; took Djakarta; imprisoned Sukarno, Hatta, and other leaders; and overran the major population centers of Java and Sumatra. On 24 Dec. the Security Council called for a cease-fire and release of the Indonesian leaders.

INDEPENDENCE OF INDONESIA. While the Dutch procrastinated over compliance with the Security Council's resolution, guerrilla activity against them increased. On 28 Jan., 1949, the Council again called for a cease-fire, the release of all prisoners, and the transfer of sovereignty to the Republic by 1 July, 1950. Under U.S. pressure, the Dutch reluctantly agreed to stop the war, effective 3 Aug., 1949. The Indonesian leaders were released, and a Dutch-Indonesian conference met on 23 Aug. Agreement was reached on Indonesian independence and

the creation of a Netherlands-Indonesian Union. Sukarno became president of the United States of Indonesia, 16 Dec., which achieved independence, 27 Dec. It consisted of all the former Netherlands East Indies except West New Guinea (West Irian). (*Contd. p. 627.*)

1961-68

WEST IRIAN DISPUTE. Indonesia maintained its claim to West Irian, and when the Dutch inaugurated a partly elective New Guinea Council, 5 Apr., 1961, the Indonesians began landing troops there, Jan. 1962. As Dutch-Indonesian troop clashes spread, the UN persuaded the two sides to talk, and it was agreed to transfer sovereignty to a temporary UN administration and then to Indonesia. The UN took over West Irian on 1 Oct., 1962, and relinquished it to Indonesia on 1 May, 1963. A plebiscite was agreed for 1969.

Malaysia

1945-48

MALAYAN UNION. On 10 Oct., 1945, the British government announced plans to create a Malayan Union, and on 1 Apr., 1946, the Union was inaugurated. It comprised the former federated and unfederated Malay States, but Singapore became a crown colony. The Malays, fearing the loss of their privileged status to the Chinese, opposed the Union, and formed the United Malays' National Organization (UMNO) under Dato Onn bin Ja'afar (b. 1895).

FEDERATION OF MALAYA. Following consultations with UMNO, the Federation of Malaya was created, 1 Feb., 1948. The Malays retained certain citizenship privileges and their sultans their prerogatives. In June a Communist-led rebellion broke out, and on 12 July a state of emergency was declared. The emergency lasted until 1960, although the political appeal of the insurgents declined after the promise of Malayan independence in 1956. A total of 11,000

lives were lost during the period of the emergency.

1949-63

INDEPENDENCE OF MALAYA. On 24 May, 1954, the Alliance Party (a merger of UMNO and the Malayan Chinese Association) under Tunku Abdul Rahman (b. 1904) called for elections. When the British government refused, the Alliance boycotted the administration. The impasse ended, 7 July, when elections were announced for 25 July, 1955. The Alliance won 51 out of 53 elective seats and called for self-government. Anglo-Malayan talks held in Jan. 1956 produced a promise of independence by 31 Aug., 1957, and set up the Reid Commission to make constitutional proposals. The Commission recommended, 20 Feb., 1957, dual citizenship for British subjects in Malaya, which the Alliance rejected, and the inclusion of Penang and Malacca (but not Singapore) in the Federation, which was approved. On 3 July a new constitution was promulgated for Malaya which preserved Malay citizenship privileges, and Malaya became independent, 31 Aug., 1957.

INDEPENDENCE OF SINGAPORE. A constitution promulgated in Feb. 1955 created a Council of Ministers, and elections held on 2 Apr. made the Labour Front the leading party. Its leader, David Marshall (b. 1908), became chief minister and called for immediate self-government. Anglo-Singaporean constitutional talks broke down, however, 5 May, and Marshall resigned, 7 June, to be replaced as chief minister by Lim Yew Hock (b. 1914). On 4 Apr., 1957, an agreement was reached with the British government by which Singapore would become self-governing after 1 Jan., 1958. The elections of 31 May, 1959, resulted in a victory for the left-wing People's Action Party, whose leader Lee Kuan Yew (b. 1923) became prime minister. Self-government was finally achieved on 3 June, 1959.

CREATION OF MALAYSIA. A proposal to create a "Greater Malaysia" of

Malaya, Singapore, Brunei, North Borneo (Sabah), and Sarawak was put forward by the Malayan prime minister. The government of Singapore endorsed the suggestion, as did the Singaporean electorate in a referendum held on 1 Sept., 1962. A commission of inquiry discovered majority pro-Malaysian sentiment in Sarawak and North Borneo, Aug. 1962. On 8 Dec., 1962, an Indonesian-aided anti-Malaysian rebellion broke out in Brunei, whose sultan had accepted membership in Malaysia. On 8 July, 1963, the governments of Malaya, Singapore, Sabah, and Sarawak agreed on a constitution for Malaysia. Brunei did not join. A UN mission confirmed that majority opinion in Sabah and Sarawak favored the membership of those countries, and Malaysia came into existence, 16 Sept., 1963. (*Contd. p. 628.*)

Burma

1945-48

DOMINANCE OF THE AFPFL. On 27 Mar., 1945, the Burmese National Army rebelled against the Japanese and joined the allies. On 17 May the British promised eventual dominion status for Burma, but argued that this must be delayed until war damage had been repaired. An Executive Council of 9 British and 3 Burmese was appointed, 1 Nov., after the Anti-Fascist People's Freedom League (AFPFL), led by Aung San (1915-47), had refused to co-operate with the British administration without a definite promise of independence. Discontent with British procrastination led to a strike, Aug. 1946, and a guarantee of independence was obtained.

INDEPENDENCE. An interim Burmese government and the summoning of a Constituent Assembly were agreed to by the British, Jan. 1947, and in elections held the following Apr. AFPFL candidates won 172 out of 182 noncommunal seats. On 19 July Aung San and 6 other Burmese ministers were assassinated. U Nu (b. 1907) formed a new government, and on 11 Oct. the independence agreements were signed by Britain and Burma. On 4 Jan., 1948, Burma became indepen-

dent, and elected not to remain a member of the Commonwealth. (*Contd. p. 629.*)

THE CARIBBEAN

British West Indies

1945-66

FEDERATION PROPOSALS. On 15 June, 1945, the British government announced acceptance of the idea of a West Indian federation if the people of the West Indies favored it. In Jan. 1947 the Windward and Leeward Islands agreed to set up a federation. On 9 Sept. representatives of all British West Indian territories met at Montego Bay, Jamaica. They agreed on the desirability of federation but disagreed on its form. The Standing Closer Association Committee set up by the conference called for a federation in its report of 10 Mar., 1950. During 1951-52 all territories except British Guiana, British Honduras, the Virgin Islands, and Barbados accepted the idea in principle. A conference on federation met, 13 Apr., 1953, and agreed on a capital in Grenada. Universal suffrage was progressively introduced in the British colonies: in Barbados in 1951, where elections were won by the Barbados Labour Party led by Grantley Adams (b. 1898), and in British Honduras and British Guiana in 1953.

GUIANA CRISIS OF 1953-54. Elections in British Guiana, Apr. 1953, were won by the People's Progressive Party (PPP), led by Cheddi Jagan (b. 1918), with 18 out of 24 seats. In Oct., the British government sent military reinforcements to Guiana and, 9 Oct., suspended the constitution and dismissed the government, claiming Jagan and his colleagues were Communists. On 20 Oct., a British White Paper claimed that the PPP government had shown no concern for the people's welfare, had used strikes for political purposes, had been under Communist influence, and had been promoting violence. On 2 Dec., the Robertson Commission was charged with recommending modifications to the Guiana constitution, and an interim government

of officials was appointed, 27 Dec. On 18 Feb., 1954, Jagan was arrested for disobeying an order confining him to Georgetown and, 12 Apr., was jailed for 6 months. On 2 Nov. the Robertson Commission reported that the Jagan government had made the Guiana constitution unworkable, and recommended slowing down the colony's progress toward self-government.

FEDERATION OF THE WEST INDIES. In Feb. 1956, a further conference on federation met in London but failed to resolve renewed disagreement over the site of a capital. Elections in Trinidad, 24 Sept., were won by the People's National Movement (PNM) of Eric Williams (b. 1911). In Jan. 1957, a British Colonial Office commission named Barbados as the site for the capital of the federation. On 3 Jan., 1958, the Federation of the West Indies was inaugurated, consisting of all the British territories except Guiana and Honduras, with a capital in Trinidad. The 1st federal elections, 25 Mar., were won by the Federal Labour Party, led by Manley, Williams, and Adams, over the Democratic Labour Party of Bustamante. Adams became federal prime minister. In September 1959, a federal constitutional revision conference opened, with Jamaica insisting on representation in the legislature on the basis of population, no agreement was reached. On 3 Aug., 1960, the Federation received internal self-government.

INDEPENDENCE OF THE ISLAND COLONIES. In May 1961, Bustamante announced that he would oppose the Federation. In May-June 1961, a Federal Constitutional Conference agreed on independence for the Federation on 31 May, 1962, and revised the constitution to make the federal government very weak. In a referendum, 19 Sept., the Jamaican electorate voted to leave the Federation. Williams won elections in Trinidad, 4 Dec., 1961, and decided to leave the Federation. After talks held on 1-9 Feb., 1962, Jamaica and Britain agreed on independence for that colony on 6 Aug. During Feb.-Mar. 1962, delegates from the Leeward and Windward Islands and Barbados met to plan a little federation.

The West Indies Federation was dissolved, 31 May, 1962. On June 8, Trinidad and Britain agreed on independence on 31 Aug., 1962. In the Bahamas self-government was introduced, 7 Jan., 1964. In Nov. 1964, agreement was reached on a federation of Barbados, Antigua, Dominica, Montserrat, St. Kitts, St. Lucia, and St. Vincent. On 30 Dec., 1965, the British government proposed that the Leeward and Windward Islands become associate states of the United Kingdom. By early 1967 all had accepted this status except Montserrat.

BRITISH HONDURAS. Elections in British Honduras, 28 Apr., 1954, were won by the People's United Party (PUP), led by George Price, whose success was repeated in the 21 Mar., 1957, elections. Price called for closer co-operation with Central America. Constitutional talks with Britain broke down in Nov., however, when Price was found to be holding secret talks with a Guatemalan official. On 6 Dec. Price was expelled from the Legislative Council, and next day British troops landed at Belize. On 11 Dec. Mexico laid claim to British Honduras.

In the elections of Mar. 1961 the PUP won all seats, and Price became 1st minister. Internal self-government was introduced, 1 Jan., 1964.

SELF-GOVERNMENT IN GUIANA. In Feb. 1955 the PPP split as Jagan expelled a group led by Forbes Burnham (b. 1923). In Apr. 1956, despite Jagan's opposition, the British government established a Legislative Council composed of an equal number of nominated and elected members. In Mar. 1960 the governments of Britain and Guiana agreed on internal self-government for the colony during 1961.

Elections were held under a new constitution, Aug. 1960. The PPP won 20 seats to 11 gained by Burnham's People's National Congress. Jagan became prime minister and demanded full independence for Guiana. A proposed tax increase led to riots in Georgetown, Feb. 1962. Britain again sent troops to restore order, but a general strike lasted from 13 to 19 Feb. A constitutional conference, Oct.-Nov., failed to reach agreement. On

22 Apr., 1963, the British Guiana Trades Union Congress called a general strike to protest expected government action against trade unions. The strike produced violence, which took an increasingly racial turn, and lasted until 8 Aug. Further racial clashes, in which over 100 were killed, were associated with a sugar workers' strike, Jan.-July 1964, and an emergency was declared, 24 May. Citing the failure of Jagan and Burnham to agree on Guiana's constitutional progress,

the British imposed a new constitution based on proportional representation. Elections held on 7 Dec. gave the PPP 24 seats, the PNC 22, and the European United Force 7. Jagan refused to resign, calling the elections fraudulent. On 12 Dec. Burnham was summoned to form a government. The PPP boycotted the Assembly until 18 May 1965. Constitutional talks in London, 2-19 Nov., which Jagan would not attend, resulted in agreement that the colony, to be known as Guyana,

would become independent on 26 May, 1966. (*Contd. p. 610.*) •

Other Territories

1945-61

FRENCH COLONIES. In accordance with the postwar French constitution, the colonies of Guadeloupe, Martinique, and French Guiana became departments of France by a law of 19 Mar., 1946. Each colony was to have an elected General Council and could send deputies to the metropolitan Parliament. In July 1961, a separatist movement, the Antillan and Guyanan Autonomy Front, was outlawed by the French government. Separatist activity continued, however, led by Aimé Césaire (b. 1913).

DUTCH COLONIES. On 3 June, 1954, representatives of the Netherlands, the Netherlands Antilles, and Surinam agreed on a constitution for a tripartite Kingdom of the Netherlands, with each region to control its own affairs and to be on an equal footing with the others. These arrangements became effective on 29 Dec.

PUERTO RICO. On 3 July, 1950, U.S. Public Law 600, ratified by the people of Puerto Rico by referendum on 4 June, 1951, went into effect: the law abolished the Organic Act of 1917 and authorized the Puerto Ricans to draw up a new constitution. This constitution, which gave Puerto Rico commonwealth status in relation to the U.S.A., was adopted by popular vote on 3 Mar., 1952, and became effective on 25 July. On 5 Nov., 1953, Luís Muñoz Marín, leader of the Popular Democratic Party, was elected governor.

AFRICA

French North Africa

1945-62

MOROCCO. Sultan Sidi Mohammed ben Youssef (1910-61) joined the *Istiqlal* call for independence in 1947. The French proposed minor reforms, but these were rejected as inadequate. Widespread vio-

lence followed, resulting in the banning of the *Istiqlal* in 1952. In 1953 the sultan was deposed by the French and exiled. Continued violence led to his recall, Nov. 1955. A new, predominantly *Istiqlal* government negotiated for independence, which was promulgated on 2 Mar., 1956.

TUNISIA. Habib Bourguiba (b. 1903), expecting little from the French after the war, settled in Cairo and campaigned for a sovereign Tunisia. In 1949 he returned to Tunisia, but reforms were blocked by French settlers. The French government moved too slowly for the Tunisian nationalists, who increased their agitation, and Bourguiba was arrested, Jan. 1952. Violence erupted throughout Tunisia, and the government of Premier Mendes-France permitted his return, June 1955, after initiating negotiations, completed 3 June, designed to lead to Tunisian internal autonomy. Bourguiba suppressed dissidence in the nationalist ranks and Tunisia became independent, 20 Mar., 1956.

• **ALGERIA.** Police suppression of riots in Setif, May 1945, led to the death of thousands of Moslems. Ferhat Abbas (b. 1899) was elected to the French Constituent Assembly. His UDMA (*Union Démocratique du Manifeste Algérien*) campaigned for a federal relationship between France and Algeria. The government of the 4th Republic, however, created an Algerian Assembly (Law of 20 Sept., 1947), elected, half by 1,300,000 Moslem voters and half by 370,000 French and 60,000 assimilated Moslem voters. The militant nationalists of Messali Hadj's PPA (*Parti Populaire Algérien*) founded, Oct. 1946, the MTLD (*Mouvement pour le Triomphe des Libertés Démocratiques*). The UDMA representatives lost their seats in the corrupt elections of 1948 and the MTLD became the dominant nationalist force. Abbas' continued efforts to negotiate with the French failed, while, within the MTLD, those favoring violent action in the face of French repression initiated "the Revolution," 1 Nov., 1954, and created the FLN (*Front de Libération Nationale*).

The French government replied with force, but terrorism spread, leading to

French and settler reprisals. The French army in Algeria reached 450,000 men. In 1956, the French by a ruse arrested and imprisoned 5 nationalist leaders, including Ahmed Ben Bella (b. 1916). Amidst growing international pressure for a settlement, the European settlers, fearing a compromise on the part of France, rebelled, May 1958. De Gaulle returned to power. In Sept. 1958 the nationalists set up a Provisional Government in Exile (GPRA) in Tunis with Abbas, who had joined the revolution in 1956, as president. (He was replaced by Youssef Ben Khedda, Aug. 1961) In Sept. 1959 de Gaulle recognized the right of Algerians to self-determination. He repressed settler and military revolts, Jan. 1960, Dec. 1960, and Apr. 1961. After preliminary negotiations between the French and the FLN at Mclun, June 1960, had failed, a settlement was reached at Evian and a cease-fire declared, 18 Mar., 1962. In a referendum, 1 July, 1962, Algerians voted overwhelmingly for independence, which was proclaimed. (*Contd. p. 611.*) “

British West Africa

1945-65

GOLD COAST. A new constitution was introduced in 1946 (the Burns Constitution), but was ill-received by nationalists because it retained a majority of indirectly elected chiefs. Discontented intellectuals united under Joseph B. Danquah (1895-1965) to form the United Gold Coast Convention (UGCC) to press for rapid constitutional progress. Danquah called Kwame Nkrumah (b. 1909) from London to be secretary of the UGCC, 1947. A UGCC-organized boycott led to rioting in urban centers, Feb. 1948. The Watson Commission recommended social, political, and educational reforms. Nkrumah rejected compromise and broke away from the UGCC to form the Convention People's Party (CPP), June 1949, calling for “self-government now.” He organized a strike and was imprisoned, Jan. 1950. In elections held under a new constitution, Feb. 1951, the CPP won and Nkrumah was released to lead a new government. In 1954 constitutional

changes provided for direct elections to all seats and the CPP won 72 out of 104 seats contested in the elections of that year. Conservative opposition parties emerged to press for a federal form of government. This was rejected, and after new elections had indicated the continued majority of the CPP, the Gold Coast became independent as Ghana, 6 Mar., 1957.

NIGERIA. The Richards Constitution, 1946, provided for a federal Legislative Council dominated by traditional and official members and also for regional advisory bodies. Awolowo agreed to work with it, but Azikiwe boycotted it, pressing for a new constitution and Africanization of the civil service. The MacPherson Constitution, June 1951, set up a strong federal government, but soon proved unworkable. In 1951 Awolowo founded the western-based Action Group (AG), while in the north the conservative Northern People's Congress (NPC) emerged. In 1953 the British called a conference of Nigerian leaders, which worked out a new constitution (effective Oct. 1954). The NPC, dominated by Ahmadu Bello, *sardauna* of Sokoto (1909-1966), declined to heed a southern call for independence, 1956. The eastern and western regions became self-governing in 1957, and the northern in 1959. Further constitutional reforms provided for a federal prime minister, and Abubakar Tafawa Balewa (1912-66), vice-president of the NPC, was appointed to that office, 1957, heading an AG-NPC coalition. Elections in 1959 confirmed the power of the AG in the west, the NCNC in the east, and the NPC in the north; the new government was an NPC-NCNC coalition. Nigeria obtained her independence on 1 Oct., 1960.

SIERRA LEONE AND THE GAMBIA. Constitutional progress in Sierra Leone was hindered by the division between the colony and the protectorate. Internal self-government was granted, 1957, to a government led by Milton Margai (1895-1964), leader of the conservative, protectorate-based Sierra Leone People's Party, which led the country to independence, 27 Apr., 1961.

Proposals for a union of the Gambia

with Senegal failed, and the colony became independent within the Commonwealth, 18 Feb., 1965. (*Contd. p. 613*).

French Tropical Africa

1945-66

RISE OF NATIONALIST MOVEMENTS. The constitution of the 4th Republic made African subjects French citizens but retained the 2-college system for elections and gave only a limited number of citizens voting rights. It created territorial assemblies with federal Grand Councils for both West and Equatorial Africa; the territories elected deputies to the National Assembly in Paris.

At the initiative of Ivory Coast planter Félix Houphouët-Boigny (b. 1905) African leaders met in Bamako, Oct. 1946, and founded the interterritorial *Rassemblement Démocratique Africain* (RDA), 1947, to press for wider reforms. RDA worked with the Communists in the National Assembly and was repressed in Africa by the French administration.

In the late 40's many Africans were killed in political riots and many imprisoned. In Madagascar, there was a revolt, beginning in Mar. 1947, which took a year to suppress and resulted in many thousands of dead.

LOI-CADRE OF 1956. In Oct. 1950 Houphouët-Boigny broke with the Communists, but despite this the RDA was defeated in the elections of June 1951, leaving the IOM (*Indépendants d'Outre-mer*), led by Léopold Senghor (b. 1906) of Senegal, as the main African party in that colony. The French reversed their policy and began to work with a more moderate RDA; the franchise was gradually widened, and reforms culminated in the Loi-Cadre, enacted June 1956, in effect Feb. 1957. The Loi-Cadre provided for adult suffrage, for elections to the territorial assemblies, and for each assembly to elect a responsible Council of Government with an African vice-president and wide powers.

ACHIEVEMENT OF INDEPENDENCE. Togo became an autonomous republic within the French Union, Aug. 1956. The legislature of the French Cam-

eroons received increased powers and the French initiated strong military action against the rebellion of the *Union des Populations du Cameroun*, a dissident branch of RDA.

In the territorial elections of Mar. 1957 the RDA won outright control in the Ivory Coast, Sudan, and Guinea. Houphouët-Boigny, a French minister since 1956, called an RDA conference at Bamako, Sept. 1957, at which disputes over federation with France were not resolved.

In the referendum on the new constitution of the 5th Republic, Sept. 1958, all territories voted for autonomy within the new French Community, except Guinea, where Sékou Touré (b. 1922) opted for independence. Attempts to refederate the territories, opposed by Ivory Coast, led to the creation of the Federation of Mali by Senegal and Sudan, 1959, while Ivory Coast, Upper Volta, Dahomey, and Niger formed the Council of the Entente, 1959. Mali demanded independence, Sept. 1959, and Malagasy did the same. All territories became independent in 1960.

French Somaliland, Réunion, and the Comoros remained as France's only African possessions after the independence of Algeria, 1962. In August 1966 de Gaulle's visit to Djibouti sparked proindependence riots. France announced a referendum on independence. (*Contd. p. 613*).

British East Africa

1945-63

UGANDA. Buganda separatism was strong after the war, and the Baganda, rejecting any diminution of the powers of their Kabaka, Frederick Mutesa II (b. 1924), opposed increased African elected representation in the Legislative Council. In 1953 the Buganda legislature, supported by the Kabaka, asked for separate independence. The British refused and deported the Kabaka. He was allowed to return, Oct. 1955, after reforms had been negotiated providing for an enlarged Legislative Council, a ministerial system, and a promise of Baganda co-operation. African parties remained weak until the amalgamation of non-Baganda parties,

1960, to form the Uganda People's Congress (UPC) under Milton Obote (b. 1924) and the invigoration of the Democratic Party, founded 1956, by Benedicto Kiwanuke (b. 1922). In the elections of 1962, the UPC won in alliance with the Kabaka's party and Uganda became independent, 9 Oct., 1962.

KENYA. White settlers opposed the moderate reforms demanded by the Kenya African Union led by Jomo Kenyatta (b. 1893). Pressure on land and political frustration among the Kikuyu led to the growth of secret societies, culminating in the Mau Mau uprising, 1952-56. Between 1952 and 1955, 10,173 Mau Mau members were killed; terrorists killed 32 Europeans, 24 Asians, and 291 Africans. Kenyatta was arrested, found guilty of leading Mau Mau, and imprisoned. As the rebellion faded out, constitutional reforms widened African representation on the Legislative Council. The Kenya African National Congress (KANU) was founded, 1960, and Kenyatta took over its leadership after his release, Aug. 1961. KANU won the elections of May 1963, and Kenyatta led Kenya to independence, 12 Dec., 1963, as prime minister.

TANGANYIKA AND ZANZIBAR. Tanganyika, a UN trust territory, progressed toward independence as the British government came under increasing UN pressure. The Tanganyika African National Union (TANU) was founded, 1954, by Julius Nyerere (b. 1921) and soon had the support of virtually all Tanganyikans. Tanganyika became independent, 9 Dec., 1961.

In Zanzibar, rivalry between the dominant Arab group and the African population produced frequent clashes. At independence, 10 Dec., 1963, the Arabs retained power. (*Contd. p. 618.*)

British Central and Southern Africa

1945-68

FEDERATION OF RHODESIA. European settlers, whose numbers rose sharply after 1945, pressed the British government to create a federation of Northern and Southern Rhodesia and Nyasaland,

where African rights were very limited. At the Victoria Falls Conference, 1949, white leaders, including Roy Welensky (b. 1907) and Godfrey Huggins (b. 1883), agreed on a federation, which the British government accepted. African opposition was strong and organized in the Northern Rhodesia African National Congress, led by Harry Nkumbula (b. 1916); the Southern Rhodesia African National Congress, led by Joshua Nkomo (b. 1917); and the Nyasaland African National Congress, inspired from London by Hastings Banda (b. 1902). Over African opposition, the Federation was created, 1953, with 6 Africans representing in Parliament 8 m. Africans and 29 whites representing 300,000 whites.

INDEPENDENCE. African opposition to the Federation continued and, despite settler pressure, Britain introduced electoral reforms in Nyasaland and Northern Rhodesia. Banda returned to Nyasaland, 1958, to fight federation. The federal government banned the Nyasaland ANC, 1959, and arrested Banda. The ANC was replaced by the Malawi Congress Party which won 90% of the vote in the elections of 1961. The Northern Rhodesia ANC was banned in 1959 and replaced by the United National Independence Party (UNIP), led by Kenneth Kaunda (b. 1924). In 1960 the British-appointed Monckton Commission proposed that each territory be empowered to leave the Federation, and the Federation was dissolved, 1963, after the departure of Nyasaland and Northern Rhodesia. New constitutions introduced in those territories provided for elected African majorities, and independence was granted. In Southern Rhodesia a new constitution had been imposed in 1961, providing for gradually increasing African rights. The settlers pressed for independence, but the British government refused. The settlers, led by Ian Smith (b. 1919), declared unilateral independence, Nov. 1965.

SOUTH-WEST AFRICA. In 1946 Chief Hosea Kutako rejected South African proposals to incorporate South-West Africa, a former League of Nations mandated territory, in the Union, and asked the UN to terminate the mandate. South Africa rejected this course. In 1950, the

International Court of Justice advised that the General Assembly had supervisory rights over South-West Africa. On 18 July, 1966, the International Court declared that Ethiopia and Liberia, which were trying to have the Court rule on whether or not South Africa had violated the mandate by imposing apartheid in South-West Africa, had no standing in the matter.

HIGH COMMISSION TERRITORIES. In 1950, the United Kingdom government banished the Bamangwato chief in Bechuanaland, Seretse Khama (b. 1921), but, at Bamangwato insistence, allowed him to return in 1956. In July 1958, the Cowen Report recommended the creation of elected organs of government in Basutoland. In local elections, 1960, the Basutoland Congress Party, led by Ntsue Mokhehle (b. 1918), won 73 out of 162 seats. The 1st general elections in Bechuanaland, Mar. 1965, were won by Seretse Khama's Bechuanaland Democratic Party, he was named prime minister, and Bechuanaland became the independent Republic of Botswana, 30 Sept., 1966. Basutoland elections, Apr. 1965, were won by the Basutoland National Party whose leader, Leabua Jonathan, became prime minister. Basutoland became independent Lesotho on 4 Oct., 1966. The 3rd High Commission Territory, Swaziland, became independent on 6 Sept., 1968.

The Sudan and Ex-Italian Africa

1915-60

ANGLO-EGYPTIAN SUDAN. Anglo-Egyptian talks to revise the Condominium failed, Jan. 1917. Egypt demanded the union of Egypt and the Sudan, and in 1951 abrogated the condominium arrangement unilaterally. Union with Egypt was advocated by Ismail al-Azhari (b. 1902), leader of the National Unionists Party (NUP), whereas the Umma ('Umma) Party of Abdullah Khalil (b. 1888) rejected union. Under nationalist pressure, Britain evolved a Self-Government Statute, 1952, but the new Neguib government of Egypt and the NUP pressed for changes, which were incorporated in an Anglo-Egyptian agreement of 12 Feb.,

1953. The NUP won the elections of 1953, and al-Azhari became prime minister. The Sudan became independent on 1 Jan., 1956.

EX-ITALIAN COLONIES. Failing agreement among the Big 4, the disposal of the Italian colonies was referred to the UN General Assembly, as agreed at the Yalta Conference. In Libya, nationalists led by Sayyid Idris (b. 1890) pressed for independence. In 1949, the UN Assembly called for the union of Cyrenaica, Tripolitania, and the Fezzan in an independent state, and in 1950 a National Assembly was convened, which drew up a constitution. Libya became independent, 24 Dec., 1951, with Sayyid Idris as king. The Assembly sent a commission to Eritrea, which failed to agree on recommendations. In Nov. 1950, the Assembly called for the federation of Eritrea with Ethiopia, and this went into effect, 15 Sept., 1952. In Somalia, the Somali Youth League (SYL, founded 1943) opposed an Italian trusteeship and called for independence within 10 years and the formation of a Greater Somalia. The Assembly voted to create an Italian trusteeship, which began on 1 Apr., 1950. The Italians encouraged the creation of parties. In municipal elections, 1954, the SYL remained the leading party. In 1956 the 1st general elections in Somalia under universal suffrage were won by the SYL, whose leader, Abdullahi Issa (b. 1922), became prime minister. Somalia united with British Somaliland and became independent, 1 July, 1960, with Aden Abdullah Osman (b. 1908), president of the SYL, as president.

Belgian and Portuguese Africa

1945-62

BELGIAN AFRICA. In 1955 a Belgian liberal manifesto called for a program leading to Congolese independence in 30 years. The 1st municipal elections in the Congo were held in 1957, and the *Mouvement National Congolaise* of Patrice Lumumba (1925-1961) achieved national prominence. Riots in Léopoldville, Jan. 1959, were followed by further reforms. In Jan. 1960 Belgian and Congolese

leaders met in Brussels and agreed on 30 June, 1960, as independence date. After elections in May a government was formed with Lumumba as prime minister and Joseph Kasavubu (b. 1910), leader of ABAKO, as president.

The Belgian change of policy also affected Ruanda-Urundi. In 1959 in Ruanda, the Bahutu overthrew the ruling Batutsi and created a republic. Belgian trusteeship ended, 1 July, 1962, and Ruanda (Rwanda) and Urundi (Burundi) became separate independent states.

PORTUGUESE AFRICA. In June 1951 Portugal declared her African colonies integral parts of Portugal, though less than 0.50% of the African population had gained *assimilado* status. A develop-

ment plan was launched and settlement by Portuguese encouraged. (The white population of Angola rose from 44,000 in 1940 to 200,000 in 1959.) African nationalist activity was not tolerated. In 1961 a revolt broke out in Angola, led by the Union of Angolan Peoples under Holden Roberto (b. 1925). In 1963 revolts broke out in Portuguese Guinea led by Amílcar Cabral (b. 1927) and the African Party for the Independence of Guinea and Cape Verde (FLING), and in Mozambique led by the Front for the Liberation of Mozambique (FRELIMO) under Eduardo Mondlane. The Portuguese sent large armies to all 3 countries, but failed to suppress the uprisings.

THE EVOLUTION OF DEPENDENT TERRITORIES

1945		1968	
Name	Status	Name	Status
<i>Africa</i>			
Algeria	Part of France	Algeria	Indep. (3 July, 1962)
Angola	Port. colony	Angola	Overseas territory of Portugal (11 June, 1951)
Basutoland	Br. colony	Lesotho	Indep. (4 Oct., 1966)
Bechuanaland	Br. protectorate	Botswana	Indep. (30 Sept., 1966)
Cameroun (Fr.)	Fr. trust territory	Cameroun	Indep. (1 Jan., 1960)
Cameroons (Br.)			
Southern	Br. trust territory	—	Part of Cameroun (1 Oct., 1961)
Northern	Br. trust territory	—	Part of Nigeria (1 June, 1961)
Congo, Belgian	Belg. colony	Congo (Kinshasa)	Indep. (30 June, 1960)
Cape Verde Is.	Port. colony	Cape Verde Is.	Overseas territory of Portugal (11 June, 1951)
Comoro Is.	Fr. colony	Comoro Is.	Overseas territory of France (internal self-government, 22 Dec. 1961)
Eritrea	Ex-Ital. colony under Br. administration	—	Part of Ethiopia (11 Sept., 1952)
Fr. Equatorial Africa:			
Chad	Fr. colony	Chad	Indep. (11 Aug., 1960)
Gabon		Gabon	Indep. (17 Aug., 1960)
Moyen-Congo		Congo (Brazzaville)	Indep. (15 Aug., 1960)
Ubangui-Chari		Central African Republic	Indep. (13 Aug., 1960)

1945		1968	
Name	Status	Name	Status
Fr. West Africa:			
Dahomey	Fr. colony	Dahomey	Indep. (1 Aug., 1960)

^a French Sudan and Senegal became independent as Mali, 20 July, 1960; the federation broke up, 22 Aug., 1960.

^b Upper Volta was recreated as a distinct unit, 4 July, 1947, out of areas of the Ivory Coast, French Sudan, and Niger.

^c Br. Somaliland became independent, 26 June, 1960, and joined Ital. Somaliland when it also achieved independence, 1 July, 1960.

^d Ex-Ital. Somaliland became an Ital. trust territory before achieving independence as Somalia.

^e Zanzibar became independent, 10 Dec., 1963, and united with Tanganyika, 26 Apr., 1964. The union was named the United Republic of Tanzania, 29 Oct., 1964.

^f The Leeward Is. Federation was dissolved, 1 Jan., 1960. Antigua and St. Kitts-Nevis-Anguilla acquired self-government, 27 Feb., 1967, within the West Indies Associated States.

^g Until 1 July, 1956, administered as part of Leeward Is.

^h The Windward Is. Federation was dissolved, 1 Jan., 1960.

ⁱ The Malayan Union, formed Sept. 1945, was replaced by the Federation of Malaya, 31 Aug., 1957, which in turn became the Federation of Malaysia, 16 Sept., 1963.

^j West New Guinea (West Irian) remained under Dutch control and did not become part of Indonesia until 1 May, 1963.

^k Following the 1st Arab-Israeli War, Dec. 1948, Transjordan incorporated Arab Palestine and changed its name to Jordan, 2 June, 1949.

¹ Singapore joined Malaysia at its inception, 16 Sept., 1963, and left the Federation to become a sovereign state, 9 Aug., 1965.

The Cold War

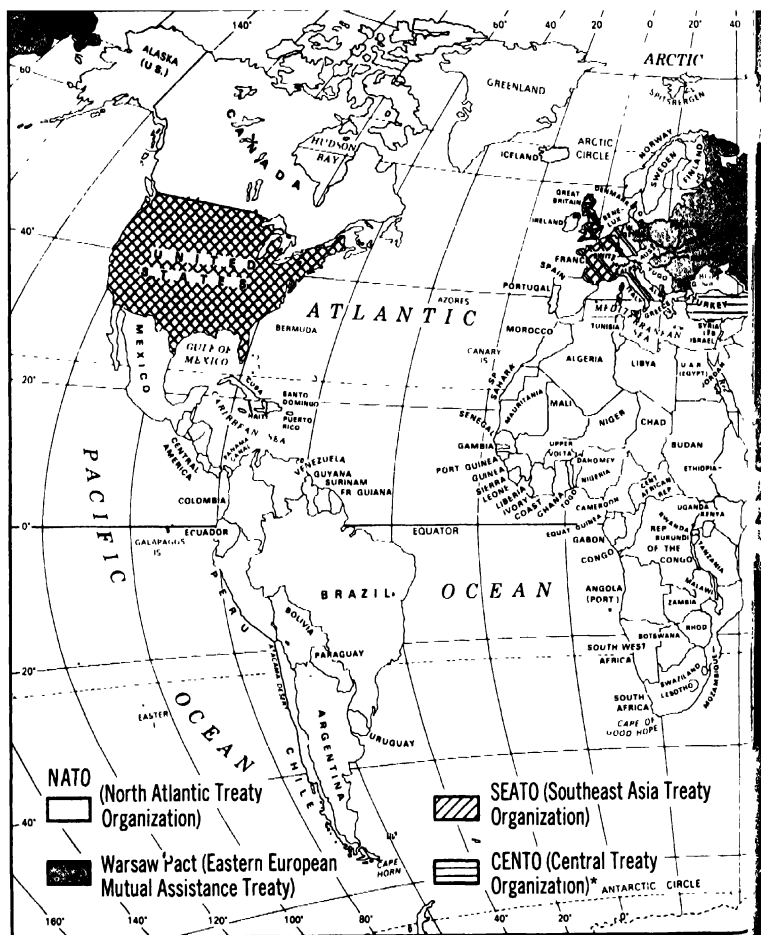

THE COLLAPSE OF THE WARTIME ALLIANCE

1945

THE ALLIANCE IN 1945. It was President Roosevelt's hope that the alliance of Britain, the U.S., and the Soviet Union would continue into the postwar world. The newly formed United Nations, with its numerous supporting agencies, was intended both as a forum in which disputes might be settled peacefully and an effective means whereby postwar recovery might be carried through.

In this perspective, the Yalta Agreements were designed to allow France a powerful voice in Western Europe and Britain a commanding role in the Mediterranean world; the Soviet Union's influence in Eastern Europe was recognized and all 4 wartime partners would combine in controlling Germany.

The defeat of Germany and Japan served to loosen the bonds among the wartime allies. President Roosevelt died, April 1945; the subsequent years witnessed a gradual return to the hostile atmosphere of an earlier period. The

*The U.S. is a member of CENTO'S Military, Economic, and

competing pressures of 2 rival world systems definitively stamped the postwar decade as a period of Cold War tensions.

1946-47

THE IRON CURTAIN. In a speech at Fulton, Mo., 15 Mar., 1946, Sir Winston Churchill, while noting Russia's anxiety "to be secure on her western frontiers by the removal of all possibility of German aggression," called for closer Anglo-American co-operation to meet the challenge of a situation in which "from Stettin in the Baltic to Trieste in the Adriatic, an Iron Curtain has descended across the Continent."

TRUMAN DOCTRINE. In Mar. 1947 President Truman enunciated in a speech to the American Congress a policy later to

be known as the Truman Doctrine. In a clear warning to the USSR he announced that for the future the U.S. "would support free peoples who are resisting subjugation by armed minorities or by outside pressure."

RIVAL POLITICAL PARTIES IN GERMANY. In Germany, a primary area of conflict, attempts at a quadripartite administration were defeated by Soviet refusal to co-operate in furnishing information and statistical returns. In Apr. 1946 the Communist Party in the Soviet zone formed an alliance with the Social Democrats in a new German Socialist Unity Party (*Sozialistische Einheitspartei Deutschlands*, SED). During 1946-47 elections were held in all zones of Germany. The SED won in the Soviet zone, and in the American, French, and British zones

the Christian Democratic and Social Democratic parties topped the polls.

OCCUPATION ZONE POLICIES. In May 1946 General Lucius Clay (b. 1897), the American commander, suspended reparation deliveries to the Russian zone in retaliation for Soviet intransigence. Secretary of State James F. Byrnes announced at Stuttgart, Sept. 1946, the pending fusion of the American and British zones; and on 2 Dec. an agreement was signed between Byrnes and British Foreign Secretary Ernest Bevin. The Soviet zone gradually became a Communist state. The Junker estates in East Prussia were divided up, and a "People's Police" was armed as a paramilitary force.

WESTERN EUROPEAN ECONOMIC RECOVERY. On 10 Mar.-24 Apr., 1947, the Council of Foreign Ministers of the great powers met in Moscow to draft peace treaties for Austria and Germany, but no agreement was reached. On 12-15 July, 16 West European delegates and 9 from the Soviet bloc met in Paris to discuss plans for European recovery (the Marshall Plan). The ministers agreed to draft a European Recovery Program (ERP), the Soviet bloc declining to join on the grounds that such a plan depended on American financing. After the withdrawal of the Soviet and East European delegates, Austria, Belgium, Britain, Denmark, Ireland, France, Greece, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Sweden, Switzerland, and Turkey set up a Committee of European Economic Co-operation (CEE). The Committee's report (the Paris Report) outlined a scheme of exchange control and tariff reduction among the members and special dollar credits were made available by the U.S.

ESTABLISHMENT OF THE COMINFORM. In Sept. 1947 a Warsaw Conference of the Communist parties of the Soviet Union, Poland, Czechoslovakia, Hungary, Rumania, Bulgaria, Italy, and France established the Communist Information Bureau (Cominform), which, with headquarters in Belgrade, would serve as an "exchange of experience and the co-ordination of activities."

A further meeting of the Big 4 foreign ministers, 25 Nov.-15 Dec., failed to agree on a German settlement, and the Foreign Ministers' Council adjourned indefinitely.

1948-49

BRUSSELS TREATY AND OEEC. In Feb. 1948 the U.S., Britain, and France conferred in London on the question of German participation in the ERP. On 17 Mar. the Brussels Treaty was signed by Britain, France, and the "Benelux" countries (Belgium, Netherlands, and Luxembourg). It provided for a 50-year defensive alliance against armed attack in Europe and set up a Permanent Military Committee in London. On 20 Mar. Soviet Commander-Marshal Sokolovsky resigned from the Allied Control Council, and on 16 Apr. the 16 nations of the ERP established the Organization for European Economic Co-operation (OEEC).

BERLIN BLOCKADE. On 18 June, 1948, currency reforms were instituted in the western zones of Germany. The new Deutschemark was established in West Germany and in the western sector of Berlin. It was banned in the Soviet zone as well as in Soviet Berlin. From Jan. 1948 onward French, British, and American traffic to and from Berlin, which lay in the Soviet zone, was being stopped and searched. Gradually a blockade of Berlin cut all access by canal, road, and rail, thereby necessitating the Berlin Airlift, which carried tons of supplies daily to the city.

On 31 July diplomatic talks between the West and the Soviets began; by the end of Aug. a draft directive on a currency for Berlin was agreed on but broken almost immediately. In Feb. 1949 the U.S. and British forces set up a blockade to halt all traffic across the eastern boundaries of their respective zones.

ESTABLISHMENT OF NATO. On 4 Apr., 1949, a North Atlantic Treaty was signed in Washington by Britain, Belgium, Italy, the Netherlands, Denmark, Luxembourg, Portugal, Iceland, Norway, Canada, and the U.S.; it promised mutual assistance against the Soviet Union in a

defensive pact under the guidance of a North Atlantic Council.

In May 1949 the Soviet government raised the Berlin blockade after 18 months of the airlift. The same month saw elections in the Soviet zone of Germany and a government under predominantly Communist leadership. The zone was renamed the German Democratic Republic (GDR), 5 Oct., 1949.

Western foreign ministers meeting in New York, 12-19 Sept., agreed to include West Germany in the system of western defense. Soviet Deputy Premier Molotov met at Prague, 20 Oct., with the foreign ministers of the GDR, Bulgaria, Hungary, and Rumania, and denounced West German participation in military alliances. On 20 Dec., 1949, the Brussels Treaty powers fused their military arrangements with those of the North Atlantic Treaty Organization (NATO).

1950-64

THE BERLIN WALL. In June 1961 the Cold War over Berlin took a serious turn. At the Vienna meeting of President Kennedy and Chairman Khrushchev, the Soviet leader called for a separate treaty with the GDR, leaving the West to negotiate arrangements with the East German government on the use of road, canal, and railway routes. Secretary of State Dean Rusk rejected these terms at a NATO Council meeting, 11 June.

In the first 10 days of July, over 1,000 refugees flooded daily into West Berlin from the east. Food and fuel rationing were introduced by the East German government. By the end of July over 13,000 had crossed. Checks and controls were increased on road and rail links. On 1 Aug. East Berliners working in West Berlin had their identity cards confiscated, and on 13 Aug. the borders were closed. This closure was made permanent, 18 Aug., by the erection of a 5-ft. concrete wall topped with broken glass and barbed wire. On 22 Aug. all crossing points except one were closed to "foreigners." A Soviet note, 23 Aug., accused the western powers of violating the 1945 agreements and called

for 4-power (including Soviet) control of the air corridors. The 3 western powers replied, 26 Aug., and denied any "competence of the Soviet Union" to discuss the use of the air corridors. On 13 Sept. a Soviet statement denied that the suggestion for a separate Soviet-East German peace treaty was an "ultimatum." A 300-ft. zone along the 25-mi. frontier between East and West was bulldozed. On 25 Oct. American tanks moved up to the checkpoint and British and French troops arrived at the border; Soviet tanks also moved up, 27 Oct., only to withdraw after 16 hours; this was followed shortly afterward by the withdrawal of U.S. tanks. The year ended with a continuing series of harassing incidents.

An agreement was eventually negotiated permitting West Berliners to visit East Berlin during Christmas 1963, and a pass accord was agreed upon, Sept. 1964, which allowed West Berliners to visit the other sector of the city on certain fixed occasions.

KOREA

1945-49

ESTABLISHMENT OF NORTH AND SOUTH KOREA. At the Cairo Conference, 1943, the U.S., Britain, and China had declared for Korea's independence, later confirmed at Potsdam, 1945. On 9 Aug., 1945, Soviet troops entered Korea and accepted the surrender of Japanese forces north of the 38th parallel, 15 Aug. U.S. troops arrived, 8 Sept., to accept the Japanese surrender in the south. A temporary military arrangement was agreed, using the 38th parallel as a dividing line.

On 8 May, 1946, the U.S. and the USSR negotiated unsuccessfully to form a national Korean government. The USSR sponsored elections in North Korea, Nov., and set up an administration under the Communist leader Kim Il Sung (b. 1912). A meeting of a U.S.-USSR commission on Korea which began 13 May, 1947, broke down on 8 July. On 14 Nov., over Soviet objections, the UN decided to send a commission to Korea to supervise elec-

tions. Under the chairmanship of India's Krishna P. S. Menon, the commission met in Seoul, 12 Jan.-14 Feb., 1948. On 23 Jan., UN sources disclosed that it had been refused entry into North Korea.

On 16 Feb., 1948, a broadcast from Pyongyang stated that a North Korean "people's army" had been formed. In Apr. an "All-Korea Joint Political Conference," meeting in Pyongyang, announced its determination to prevent the holding of elections in South Korea. Despite serious disturbances, however, and the disruption of some railways and the government's communications system, elections were held, 10 May. They resulted in a victory for 2 "rightist" parties, headed by Syngman Rhee (1875-1965) and Kim Sung Soo. Rhee was elected president, 20 July. The Republic of Korea (southern part of the country) was proclaimed, 15 Aug., 1948. On 8 Sept. the northern part became the People's Republic of Korea.

1950-59

OUTBREAK OF THE KOREAN WAR.

On 25 June, 1950, hostilities began. The UN commission reported that South Korea had been invaded by North Korean forces. A Security Council emergency meeting called for immediate cessation of fighting and withdrawal of northern forces. North Korea's failure to comply resulted in a Security Council resolution, 27 June, 1950, asking members to aid South Korea "to repel the armed attack." On 7 July the Security Council established a unified UN Command under the U.S. to send aid to South Korea. This was endorsed by 53 member states. Gen. Douglas MacArthur was appointed commander in chief of UN forces in Korea.

COURSE OF HOSTILITIES. South Korean territory was almost completely overrun in the initial engagements and U.S. casualties were heavy. The North Korean push was halted 50 mi. from Pusan on the south coast. On 14 Sept., 1950, an American army landed at Inchon and retook the old capital of Seoul. Each

side reverted to the 38th-parallel demarcation line, and Gen. MacArthur delivered a surrender ultimatum to the North Korean forces. This was rejected and U.S. troops crossed the parallel, 9 Oct., took Pyongyang, the northern capital, and by Nov. had reached the Yalu River between North Korea and Manchuria.

Chinese forces intervened in considerable numbers; Seoul was captured by North Korean and Chinese troops, 4 Jan., 1951, but was retaken in Mar. by forces under Gen. Matthew B. Ridgway.

DISMISSAL OF MacARTHUR. Gen. MacArthur, without authorization from his government, declared himself prepared to negotiate with the commander of the Chinese and North Korean forces. He warned China she faced military extinction if the U.S. extended the war to Chinese coastal and interior bases. Secretary of State Dean Acheson characterized the threat as "unexpected and unauthorized" and Gen. MacArthur was relieved of his command, 11 Apr. He addressed a joint session of Congress, 19 Apr., criticizing the administration's handling of the war.

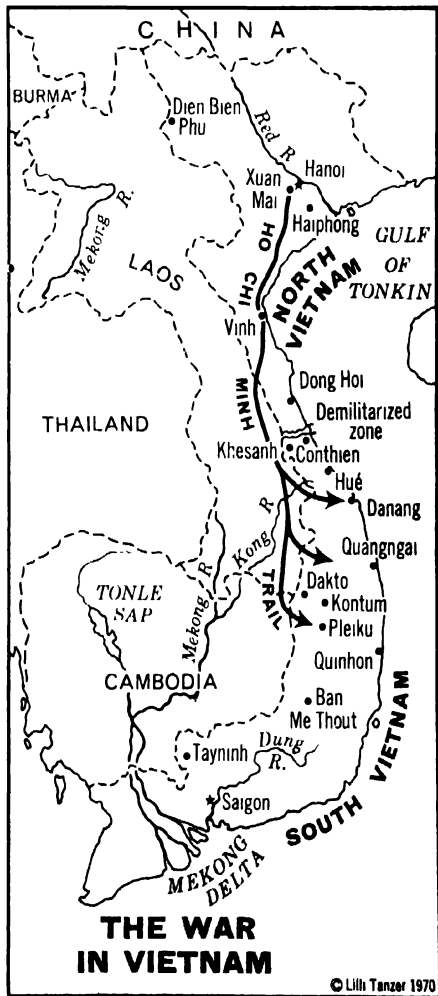

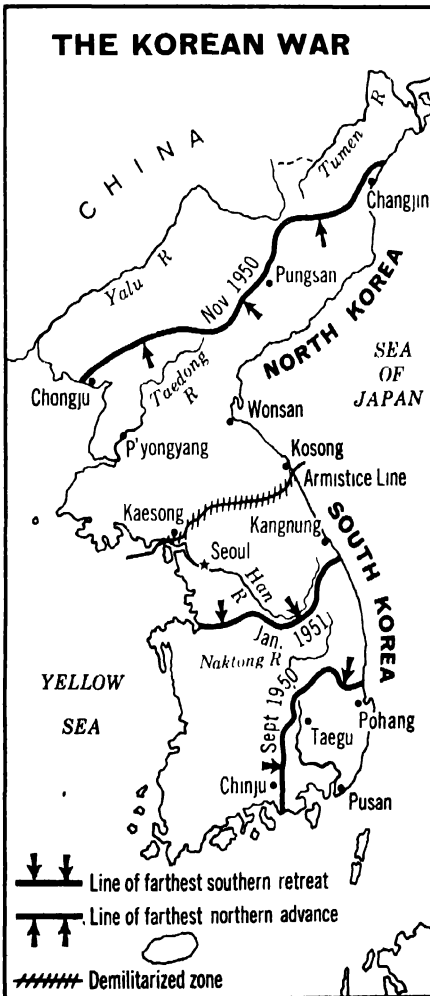

KAESONG AND PANMUNJOM TALKS. North Korean and Chinese armies began a spring offensive, 15 May. They sustained heavy losses and were forced to withdraw. Armistice negotiations began at Kaesong on the parallel in July and continued until 5 Aug., when Gen. Ridgway broke them off, charging violation of demilitarization regulations. The talks continued at Panmunjom, 25 Oct., mainly on the question of repatriation of war prisoners. An armistice was signed 26 June, 1953, with an uneasy truce continuing thereafter. A U.S.-South Korean mutual defense treaty went into effect 17 Nov., 1954.

SUPERVISORY COMMISSION. The armistice ended the war but the political differences remained. In Feb. 1954 a Geneva Conference of Foreign Ministers failed to agree on reunification procedures. The Neutral Nations Supervisory Commission was set up to carry out the armistice agreements, but was finally withdrawn in 1956.

1960-68

THE 2 KOREAS. In Mar. 1960 President Syngman Rhee of South Korea was re-elected, but the elections were subsequently declared fraudulent; student rioting followed and Rhee was forced to resign, Apr. 1960. In July 1960 new elections brought the opposition party, the Conservative Democrats, to power. The National Assembly chose as premier Dr. J. M. Chang (1899-1966) and as president Yun Po Sun (b. 1897), a rival of Chang's. The new administration promised economic reform, but large-scale unemploy-

ment and inflation reduced the effectiveness of the new government. On 16 May, 1961, the military overthrew the civilian government. Gen. Chung Hee Park (b. 1916) emerged as the dominant military figure, and in 1964 resigned from the army to be elected president. Park was faced with an increased number of border skirmishes, which were attributed to South Korean involvement in the Vietnam War. In Jan. 1968 North Korean infiltrators penetrated to Seoul in an attempt to assassinate Park. On 23 Jan., 1968, the U.S. Navy intelligence ship *Pueblo* was seized by North Korea,

which charged that the vessel had been engaged in electronic spying within its territorial waters. Despite intensive U.S. diplomatic efforts the *Pueblo's* 83-man crew were not released until Dec. 1968, and the ship herself remained in North Korean hands.

CUBA

1953-68

THE CASTRO REVOLUTION. On 26 July, 1958, Fidel Castro (b. 1927) with 170 followers attacked the Moncada Barracks at Santiago de Cuba. This event marked the beginning of the Cuban revolt against dictator Fulgencio Batista, who had come to power in a coup on 10 Mar., 1952.

Although the attack was a failure, it brought Castro recognition. In Sept. 1956 he traveled to the U.S. to collect support and funds for another rising. On 2 Dec. he landed in Oriente Province with 82 followers; they were discovered by Batista forces and only 12 escaped to the Sierra Maestra. During Aug.-Sept. 1958 Castro's lieutenant, Ché Guevara (1928-67) led a successful uprising in Las Villas Province. On 5 Nov. Castro emerged from the mountains and launched a military operation designed to take over the island. Santa Clara fell to Guevara, 31 Dec., and underground Castro supporters rose to take Havana. In Jan. 1959 Batista fled Cuba and Castro became premier, 16 Feb.

The beginning of Castro's rule was marked by an agrarian reform program and widespread executions of Batista officials. Criticism of the revolutionary tribunals carrying out these punishments led to their dissolution. May 1959.

U.S.-CUBAN RELATIONS. During 15-20 Apr., 1959, Castro visited the U.S., where his statements suggested a desire to maintain friendly relations and win the support of moderate elements. After the agrarian reform law of 2 June, however, there was a marked change in U.S.-Cuban relations. The new law allowed the government direction of the national economy and was the 1st step toward a socialist state in Cuba.

On 27 June the U.S. charged that Cuba was adding to tensions in Latin America. U.S.-owned oil refineries were nationalized, 29 June, and on 3 July Congress voted to cut the Cuban sugar quota. In Oct. 1960 the U.S. imposed an embargo on all exports to Cuba except unsubsidized food and medical supplies. Cuban trade with Communist countries served to fill the gap left by U.S. withdrawal: 700,000 tons of sugar rejected by the U.S. in July 1960 were bought by the USSR and China also became a customer. On 7 Aug. all major enterprises controlled by U.S. subjects in Cuba were nationalized.

Relations with the U.S. became further strained over the question of the U.S. naval base at Guantánamo, held under a U.S.-Cuban treaty of 1903. (Cuban water supplies to the base were cut off, 6 Feb., 1964, in reprisal for U.S. seizure of 4 Cuban fishing boats off the coast of Florida.)

On 3 Jan., 1961, Cuba ordered U.S. embassy personnel limited to 11, the size of Cuban representation in the U.S. The U.S. broke off all diplomatic relations, American interests in Cuba being represented by the Swiss.

BAY OF PIGS INVASION. On 17 Apr., 1961, 1,200 anti-Castro Cuban activists, who had been trained in Guatemala by the U.S. Central Intelligence Agency, landed with U.S. military supplies and support facilities at the Bay of Pigs, Cuba. They encountered severe resistance and were defeated in a few days. Most of them were taken prisoner and later ransomed with funds raised in the U.S. On 31 Jan., 1962, Cuba was expelled from the Organization of American States (OAS).

CUBAN MISSILE CRISIS. President Kennedy, in an address to the nation, 22 Oct., 1962, demanded the withdrawal of Soviet missiles from Cuba. An air and naval quarantine was ordered, 24 Oct. On 27 Oct. Kennedy rejected a Soviet proposal to withdraw missiles from Cuba in exchange for a withdrawal of U.S. missiles from Turkey. On 28 Oct. Chairman Khrushchev agreed to dismantle and remove Soviet rockets and Kennedy agreed not to invade Cuba. A joint U.S.-USSR

note to UN Secretary General U Thant, 7 Jan., 1963, officially declared the crisis resolved.

DEATH OF GUEVARA. Cuba's efforts to export its revolution to other Latin American countries through the clandestine shipment of arms and the training of guerrillas continued to be largely unsuccessful. The U.S. accelerated its training of Latin American military men in counterinsurgency warfare, and on 9 Oct., 1967, these efforts bore fruit when Ché Guevara was killed while leading a guerrilla group in Bolivia.

VIETNAM

1954

GENEVA CONFERENCE. 26 Apr.-21 July. The Geneva Conference originally had been called to effect a political settlement in Korea as well as to resolve the Indochina war. The talks on Korea, involving 19 nations, quickly stalemated and ended, 15 June, without any results. The U.S., Britain, France, Russia, and Mainland China also took part in the talks on Indochina, the other participants being the French-sponsored State of Vietnam, the Democratic Republic of Vietnam (the Vietminh), Laos, and Cambodia. This phase of the conference opened, 8 May, coincident with the French surrender, a few hours earlier, of Dien Bien Phu—a military defeat which made clear the bankruptcy of France's policy and position in Indochina. The talks made little progress until after 18 June, when Pierre Mendès-France (b. 1907) became French premier and promised to end the war by 20 July.

GENEVA ACCORDS AND FINAL DECLARATION. 20-21 July. The Accords were signed cease-fire agreements between representatives of the forces fighting in Indochina. The Vietnam agreement included provisions calling for a temporary demarcation line (the 17th parallel) with a buffer or demilitarized zone 5 km. wide on either side designed to permit regrouping of forces, each signatory party to administer its half of the

country pending general elections which would bring about unification, a ban on the introduction of new military personnel or matériel, a 300-day period during which Vietnamese would have free choice to decide which part of the country they wished to live in, and supervision by the International Control Commission (India [chairman], Canada, Poland) of the agreement. The Final Declaration, 21 July, endorsing the Accords as well as adding that the unification elections should take place within 2 years, was orally assented to by all but the State of Vietnam and the U.S., although U.S. delegate Undersecretary of State Walter B. Smith (1895-1961) declared that the U.S. would "refrain from the threat or use of force to disturb" the agreements, but would view "any renewal of the aggression . . . with grave concern. . . ."

1954-56

RISE OF DIEM. On 17 June, 1954, Bao Dai (b. 1913), head of the State of Vietnam, appointed Ngo Dinh Diem (1901-63) prime minister (invested formally 5 July). Diem, supported by various American interests, rapidly consolidated his power. American influence became paramount as by Apr. 1956 Diem had ended almost all official French presence in South Vietnam. Using cash and force of arms, he broke, 1955-56, the power of the politico-religious sects. He used an engineered referendum, 23 Oct., 1955, to depose Bao Dai and as a basis for the declaration, 26 Oct., of the Republic of Vietnam under his presidency. A Constituent Assembly, elected, 4 Mar., 1956, in polls which allowed for no real opposition, drafted a constitution (promulgated 26 Oct., 1956) which transformed it into a National Assembly and which confirmed Diem's power.

THE DVR AND UNIFICATION ELECTIONS. In the north the Democratic Republic of Vietnam, under the leadership of Ho Chi Minh (b. c. 1890), attempted to straighten out its economic difficulties (agrarian unrest led to a peasant rebellion which was brutally crushed

in Nov. 1956), reorganized its government structure, and prepared for the unification elections. Most observers have agreed with the Vietminh's assumption that it would have won the elections handily. The Diem government, with American support, rejected attempts, 1955-56, to have these elections, declaring it had not signed and therefore was not bound by the Geneva Accords, and that conditions for free elections must 1st be evidenced in North Vietnam. The unification elections were never held.

FOREIGN SUPPORT FOR SOUTH VIETNAM. A protocol to the Southeast Asia Collective Defense Treaty, 8 Sept., 1954, extended its provisions to include Cambodia, Laos, and "the free territory under the jurisdiction of the State of Vietnam." On 1 Oct. U.S. President Eisenhower (1890-1969) wrote Diem (letter delivered 23 Oct.) offering U.S. assistance "in developing and maintaining a strong, viable state, capable of resisting attempted subversion or aggression. . . ."

1957-60

RENEWAL OF HOSTILITIES. At the end of 1956, Communist guerrillas (Vietcong, as they came to be called, from the words *Viet-Nam Cong-San* meaning "Vietnamese Communists") began sporadic terrorist activity in South Vietnam. The 1st U.S. military casualties occurred, 22 Oct., 1957, when a bomb exploded in the quarters of U.S. Military Assistance and Advisory Group personnel. The guerrilla campaign, constantly growing in scope and apparently receiving increasing encouragement from the north, reached its 1st peak in Jan. 1960, when the Vietcong overran some Army of the Republic of Vietnam (ARVN) posts. The U.S. announced, 5 May, 1960, that at the request of South Vietnam the number of U.S. military advisers would be raised from 327 to 685 by year's end.

The increasingly authoritarian (opposition winners in the 30 Aug., 1959, National Assembly elections were not allowed to take their seats), corrupt, and nepotistic Diem government had proved unable to counter the Vietcong's impact

despite generous U.S. aid which some observers calculated averaged as high as \$300 million annually. In a lengthy night meeting, 19-20 Dec., 1960, the National Liberation Front of South Vietnam (NLF) was formed, including both Communist and non-Communist anti-Diem insurgents.

1961-64

GROWTH OF COMMUNIST STRENGTH. In 1961 the annual death toll (c. 500) of Vietnamese friendly to the Diem regime and to the U.S. was 10 times greater than it had been in 1959. The strength of the Vietcong (est. 15,000) had trebled since 1959. Infiltration from the north of former Vietminh personnel was on the rise. Much of the countryside (estimates ran as high as 80%) had fallen under NLF sway. On 9 Apr., 1961, Diem, who had overcome, Nov. 1960, a coup directed against him, was re-elected, but despite the government's control of the polls the results demonstrated his limited support. On 18 Oct., 1961, he proclaimed "a state of emergency" (extended 26 Oct., 1962, for 12 more months).

AMERICANIZATION OF THE WAR. Three American missions visited South Vietnam during 1961, and U.S. President Kennedy (1917-63) reaffirmed, 14 Dec., the U.S. commitment to the country. Although Kennedy decided against sending large numbers of troops to Vietnam, 1,500 additional advisers were sent who now were permitted "to advise in battle mission." Two U.S. army helicopter companies, the 1st direct U.S. military support for battle against the NLF, arrived in Saigon, 11 Dec., 1961. During 1962 the situation continued to deteriorate despite massive American financial support. Great emphasis was placed on the "strategic hamlet" idea (1st used in the late summer of 1961), but by year's end maladministration had indicated the ultimate failure of this policy. Diem promised the U.S. that he would implement all sorts of needed reforms, but failed to do so effectively.

The by now 4,000 American military personnel (as of 8 Feb. under the direc-

tion of a new U.S. Military Assistance Command, Vietnam) chafed at their inability to do more than advise the ARVN, which in a series of supposed mopping-up operations demonstrated its incompetence. On 10 Mar. the U.S. admitted that American pilots were flying some combat missions in South Vietnam. On 31 Dec., 1962, U.S. forces numbered 10,000.

During 1963, although U.S. policy-makers continued to affirm support for South Vietnam, their disenchantment with the Diem government rose perceptibly as it proved incapable either of dealing with the enemy or of winning over the citizenry. On 2 Jan., 1963, at Ap Bac, a fortified village in the Mekong Delta, in the war's 1st "stand and fight" battle, 200 Vietcong held their ground against 2,000 ARVN with armor and air support. Throughout the year the Vietcong, increasingly reinforced from the north, stepped up the number and intensity of their raids as the ARVN proved unable to deal with them.

BUDDHIST CRISIS. May-Sept. 1963. Diem, a Catholic, had received considerable support from the 900,000 mostly Catholic refugees who had fled south in 1954-55. Friction had arisen between the Diem government and the leaders of the Buddhist majority of the population at first because of apparent favoritism toward Catholics and then, 1962-63, because of religious oppression apparently instigated by Diem's brother Ngo Dinh Nhu (d. 1963), the head of the secret police. The climax came after police in Hué, governed by another Diem brother, fired, 8 May, into a crowd protesting against not being allowed to fly Buddhist flags during a religious festival. Demonstrations spread to Saigon. A Buddhist monk immolated himself in protest, 11 June, the first of 7 persons to do so. Increasing unrest forced Diem to proclaim, 21 Aug., martial law (ended 16 Sept.). In apparent indifference to all that had gone on, the government held elections, 27 Sept., in which all candidates had to be approved in advance.

END OF DIEM GOVERNMENT. 1-2 Nov., 1963. With American foreknowledge and probable connivance a group of

South Vietnamese armed forces leaders carried out, 1 Nov., a coup against the Diem government, murdering, 2 Nov., Diem and Nhu, and establishing junta rule.

PLEDGE OF SUPPORT BY JOHNSON. In 1964 the official U.S. position continued to be that the war was strictly a Vietnamese conflict, but in practical terms the U.S. was taking over increasingly both its direction and prosecution, especially as the leaders of the South Vietnamese armed forces jockeyed with each other for control of the government. Coups followed each other so rapidly that no government lasted more than 5 months. On 1 Jan. U.S. President Johnson (b. 1908) reaffirmed the U.S. commitment in South Vietnam and promised the government there: "We shall maintain in Vietnam American personnel and matériel as needed to assist you in achieving victory."

INCREASED NLF ACTIVITY. The NLF again stepped up its activity (according to U.S. sources the total number of "incidents" went from 19,500 in 1963 to 25,500 in 1964). Increasingly terrorist operations were directed against Americans (most notably a raid on U.S. barracks in Kontum, 2 Feb., bombings of Saigon hotel billets, 25 Aug. and 24 Dec., and an attack on the U.S. air base at Bien Hoa, 30 mi. from Saigon, 1 Nov.)

TONKING GULF INCIDENT. 2-7 Aug., 1964. Apparently as an aftermath of a South Vietnamese raid, 30-31 July, on North Vietnamese naval installations, North Vietnamese PT boats attacked, 2 Aug., the U.S. destroyer *Maddox* on patrol in the Gulf of Tonking. President Johnson ordered, 3 Aug., the patrol reinforced, and although exactly what happened remains unclear, the destroyers *Maddox* and *C. Turner Joy* reported, 4 Aug., a North Vietnamese PT-boat attack. In reprisal U.S. planes for the 1st time bombed North Vietnamese bases. Johnson appealed to Congress for support and it approved, 7 Aug. (House: 416-0; Senate: 88-2), a resolution authorizing the President "to take all necessary measures to repel any armed attacks against the forces of the U.S. and to prevent future

aggression." By 31 Dec., 1964, U.S. forces in South Vietnam numbered 23,000. The North Vietnamese army was estimated to have 1,000-5,000 troops in South Vietnam.

1965

ACCESSION OF THIEU AND KY. Although not officially, U.S. policy during 1965 shifted from support of democratic government in South Vietnam to defeat of North Vietnam.

Successive coups continued to disrupt the South Vietnamese government, Jan.-June, 1965, and the situation did not stabilize until 19 June, when in another coup Gen. Nguyen Van Thieu (b. 1923) and Air Vice-Marshal Nguyen Cao Ky (b. 1930) became head of state and premier in the 9th regime since the fall of Diem.

ESCALATION. Deeper U.S. involvement began ostensibly in response to a Vietcong attack, 7 Feb., on U.S. personnel at Pleiku which resulted in retaliatory air strikes against North Vietnam, 7, 8 Feb., as did, 10 Feb., a raid on U.S. barracks at Quinhon. On 24 Feb. U.S. bombers for the 1st time attacked Vietcong targets in South Vietnam. President Johnson announced, 28 Feb., a policy of continuous air strikes against North Vietnamese military targets to force the enemy into "a negotiated settlement." On 7-9 Mar. 3,500 U.S. marines landed at Da Nang to guard the U.S. air base there. This raised U.S. forces in South Vietnam to 26,500, which reinforcements by June had raised to 34,000, all technically still advisers. On 9 June U.S. troops were officially committed to field operations, taking part in their 1st major offensive, in Zone D, on 28 June. During July to Dec. increasing numbers of U.S. troops (31 Dec., 175,000) became involved in heavy combat operations throughout South Vietnam. U.S. casualties in 1965: 1,350 dead, 5,300 wounded, 148 missing or captured.

Despite the influx of U.S. troops, NLF operations continued (U.S. sources estimated 26,500 incidents). Estimates of North Vietnamese troops in south at year's end ranged from 11,000 to 40,000.

PEACE OVERTURES. On 24 Feb., 1965, UN Sec. Gen. U Thant (b. 1909) announced that his determined efforts, Sept. 1964-Jan. 1965, to arrange peace talks had failed, and indicated the fault lay with the U.S. On 8 Apr., North Vietnam put forth a 4-point program which in effect called for U.S. withdrawal, neutralization of a peacefully united Vietnam, and settlement of South Vietnam's internal affairs "in accordance with the program of the NLF." The U.S. termed the program unacceptable. A U.S. halt of air raids on North Vietnam, 13-19 May, elicited no response satisfactory to American policymakers. Tortuous negotiations, Nov.-Dec., involving Italian officials came to an abrupt and unsatisfactory end, 15 Dec., when U.S. planes for the 1st time bombed a major North Vietnamese industrial target. Other more informal attempts during the year by various parties, including the Russians, the pope, and French President de Gaulle to arrange peace talks also failed.

In the U.S. many disagreed with the escalation policies of the Johnson administration, and teach-ins, mass protests, and open letters expressed their dissatisfaction. On 15-16 Oct., 1965, there were nationwide antiwar demonstrations in which thousands participated.

1966

CONDUCT OF THE WAR. Despite heavy losses (600 planes between Feb. 1965 and Oct. 1966), the U.S. extended the air war over North Vietnam with multiplane missions (some from bases in Thailand) and a growing list of targets. On 29 June occurred the 1st U.S. bombing of installations near Hanoi, North Vietnam's capital, and Haiphong, its key port; 1st U.S. bombing of the demilitarized zone, 30 July.

On the ground, taking over the bulk of the offensive fighting from the dispirited ARVN, U.S. troops (by 31 Dec. nearly 380,000 strong, with another 30,000 in Thailand) engaged in "search and destroy" missions as well as larger actions in pursuit of a policy of attrition against the

enemy. Despite impressive numbers of kills as well as a continued troop build-up, the U.S., even with the support of nearly 30,000 South Koreans, smaller contingents of Australian and New Zealand forces, and the ARVN, could not achieve the 10:1 ratio military experts considered necessary to control guerrilla operations. Vietcong recruits and North Vietnamese infiltrators kept the ratio at about 3:1.

PEACE OVERTURES. All attempts by interested parties (including U Thant, 24 May; de Gaulle, 1 Sept., and the pope, 4 Oct.) to achieve some kind of settlement foundered on the divergent views of the U.S. and North Vietnam on the status of the NLF. The U.S. said it would not, as North Vietnam demanded, recognize the NLF's separate status.

Political unrest continued in South Vietnam as Buddhists confronted, Mar.-June, the government, which agreed to elections (held 11 Sept.) for a Constituent Assembly, although the electoral laws enacted assured Ky and the military junta of victory.

On 6-8 Feb., President Johnson met with Ky in Honolulu, and on 24-25 Oct. with the leaders of Australia, New Zealand, the Philippines, South Vietnam, Thailand, and South Korea (all countries directly involved in the war). These conferences resulted in declarations and afforded the U.S. President a chance, 26 Oct., to visit South Vietnam, but otherwise had little effect on the war.

In the U.S. antiwar protests continued. On 25-27 Mar. there was an international protest weekend.

1967

CONDUCT OF THE WAR. Events followed what had become a familiar pattern. A holiday truce, 31 Dec., 1966-2 Jan., 1967, as well as a Lunar New Year bombing halt, 8-12 Feb., resulted in no positive steps toward peace. The U.S. and North Vietnam expanded their efforts. On 22 Feb. U.S. artillery for the 1st time fired across the demilitarized zone into North Vietnam. On 26 Feb. U.S. warships, which had done so, sporadically, in

the past, began shelling targets in North Vietnam on a continuing basis without restrictions. U.S. planes began to mine North Vietnamese rivers, 27 Feb. On 11 Aug. U.S. planes began bombing within 10 mi. of the China border and the Chinese began to claim violations of their air space.

The ground war continued to be fought fiercely. U.S. forces, numbering, Feb., more than 400,000, and augmented contingents from South Korea (45,000), Australia (4,500), and New Zealand (360), were engaging an increasingly large enemy force (The infiltration from North Vietnam was estimated as high as 7,000 a month.) On 19 May U.S. and ARVN forces moved into the southern portion of the demilitarized zone.

ELECTIONS IN SOUTH VIETNAM. In South Vietnam the military continued to dominate the political scene. Despite the presence of 20 eminent Americans, sent by President Johnson to observe the polling, campaign laws and practices made it evident that Thieu and Ky, the junta's candidates for president and vice-president, would win the elections, 3 Sept. They did so, but only with a plurality.

PEACE OVERTURES. International proposals for settlement of the war gave way to appeals for an end to hostilities, especially the bombing of the North, which North Vietnam indicated must be granted unconditionally before any talks could begin. The U.S., within which antiwar sentiment was sharply on the rise, came under renewed criticism internationally for its policies in Vietnam. The *détente* with the Soviet Union became strained as the latter increased its assistance to North Vietnam; on 23 Sept. the USSR formally signed an aid pact with the DRV.

1968

RIVAL POLICIES AND STRENGTHS. At the beginning of 1968 the dominant issues remained unchanged: North Vietnam insisted on an unconditional halt to the bombing as a preliminary to peace

talks of any sort; the U.S. insisted on reciprocity. North Vietnam continued to demand NLF representation at any peace talks; the U.S. refused to accept the NLF as more than an expedient creation of North Vietnam. On 1 Jan., 1968, U.S. troop strength was 475,000 men, about 2,000 more than the peak U.S. strength during the Korean War. By Dec. 31 there were approximately 550,000 U.S. servicemen in South Vietnam.

TET OFFENSIVE. 30 Jan.-25 Feb. The NLF, using Vietcong guerrillas and North Vietnamese regulars, launched, 30 Jan., widespread co-ordinated attacks on major urban areas throughout South Vietnam. Coming on what was supposedly the 1st day of a mutually agreed upon Tet, or Lunar New Year, truce, this offensive had considerable success. In Saigon, Vietcong commandos occupied U.S. embassy buildings for 6 hours before being wiped out. In Huế, block-by-block fighting lasted until 24 Feb. Other cities also fell into Communist hands for a short time. Although U.S. military spokesmen said the offensive had failed to make any lasting military headway, they admitted it had a strong propaganda impact, since it came in many areas which had been said to be secure from such attacks.

On 31 Mar. President Johnson announced halting of the bombing north of the 21st parallel and asked for a response from North Vietnam.

PEACE TALKS. On 3 May, after 5 weeks of wrangling about the location, both sides finally agreed on Paris as the site for talks preliminary to peace negotiations. Preliminary talks, 10 May-1 Nov., failed, as North Vietnam continued to insist on an unconditional halt to the bombing and the U.S. continued to demand reciprocity. On 1 Nov. the U.S. ceased aerial, naval, and artillery bombardment of North Vietnam. Wrangling over the shape of the conference table, Nov.-Dec., an apparent detail related to the status of the NLF delayed the beginning of formal peace talks.

CONDUCT OF THE WAR. The war continued unabated while negotiations

went on. From Jan. to 5 Apr., NLF forces besieged 6,000 U.S. marines at Khesanh. On 8 Apr., U.S. and allied forces launched "Operation Complete Victory," announced as "the biggest drive of the war so far," in an attempt to clean up Communist forces in the 11 provinces around Saigon. On 5-13 May the Communists' 2nd major offensive of the year throughout South Vietnam hit hard at Saigon, and the city was struck again, 3-15 June. Savage fighting broke out again in July in various provinces and continued into the fall.

On 23 June, 1968, the undeclared war in Vietnam became the longest sustained military action ever fought by the U.S. It had lasted 6 years, 6 months, and 1 day since the death of the 1st U.S. serviceman at the hands of the Vietcong on 22 Dec., 1961. Total U.S. casualties since then, as of 31 Dec., 1968: 29,000 dead, 185,000 injured, 950 missing, 350 captured. Deaths since 1 Jan., 1961, of other forces: ARVN, 73,000; allied forces, 2,500; enemy (U.S. and South Vietnam estimates), 414,000.

THE NUCLEAR ARMS RACE

1945-68

U.N. ATOMIC ENERGY COMMISSION. Atomic bombs dropped on Hiroshima, 6 Aug., and Nagasaki, 9 Aug., 1945, ushered in an international debate on the control of atomic armaments. On 24 Jan., 1946, the UN Atomic Energy Commission was established. It consisted of 1 representative from each Security Council nation and a Canadian representative.

EARLY ARMS CONTROL PROPOSALS. A Soviet motion at UN General Assembly, 1946, proposed a general reduction of armaments by all the major powers. A counterresolution submitted by Britain sought to extract details of all armed forces and verification of figures. The USSR insisted on the inclusion of armament details as well. A compromise resolution, 14 Dec., asked the Security Council to decide what information should be provided by each state. During 1947-48, however, discussions on the con-

trol of arms foundered. The USSR insisted in the UN General Assembly, 18 Sept., 1948, that primary importance must be attached to the banning of atomic weapons—on which the West then had a monopoly. No agreement could be reached on inspection procedures.

RESUMPTION OF THE ARMS RACE. 1949–50 were years of national rearmament, with wars taking place in Malaya, Indochina, and Korea. The production of more effective atomic bombs was announced, 1 Aug., 1949, by the U.S. Atomic Energy Commission. On 20 Sept., 1949, the 4th UN General Assembly met against a background of reports of an atomic explosion in Siberia and of a new U.S. weapon, the hydrogen bomb. On 28 Jan., 1950, the Russians claimed parity with the U.S. in the atomic field. The decision to rearm West Germany inside NATO, 19 Dec., 1950, and the Korean War prevented serious disarmament negotiations.

REJECTION OF DISARMAMENT PROPOSALS. In Oct. 1951 the USSR exploded another atomic bomb. An Atomic Energy and Conventional Armaments Commission of the 4 Big Powers was established, Dec. 1951, to draft a treaty providing for regulation and reduction of all armed forces as well as abolition of weapons of mass destruction. The USSR announced a successful hydrogen bomb test, 20 Aug., 1953. A Russian resolution on disarmament was defeated in the General Assembly, 27 Nov. On 8 Dec., President Eisenhower proposed an international pool of atomic materials, but this was rejected by the Soviet Union, 22 Dec.

INCREASE IN WEAPONS TESTING. U.S. Secretary of State John Foster Dulles spoke of the need for "massive retaliatory power," 12 Jan., 1954. American nuclear tests carried out in Mar. injured Japanese fishermen. Prime Minister Nehru of India called for a halt to all testing, 22 Apr.

A conference of heads of state and foreign ministers in Geneva, 18–23 July, 1955, saw the beginning of a letup in the arms race. No definite agreement was

reached, however, and the USSR resumed testing of nuclear weapons, 24 Aug., 1956. Another call for the halting of tests was put forward, 2 July, 1957, by Canada, France, Britain, and the U.S.

All of these moves and countermoves were overshadowed by the growing tension in Europe. The Berlin crisis heralded resumption of heavy testing by the Soviet Union—a series of 30 tests from Aug. to Oct. 1961. U.S. testing resumed on 15 Sept.

BAN ON ATMOSPHERIC TESTS. On 5 Apr., 1963, the Soviet Union accepted a U.S. proposal for direct communication between the 2 heads of state—the "hot line." President Kennedy announced, 10 June, a moratorium on nuclear testing in the atmosphere. Three-power talks in Moscow (USSR, U.S., and Britain) began, 15 July, and produced the 1st Test Ban Treaty by which no tests might be conducted in the atmosphere, in outer space, or under water. The treaty was signed in Moscow, 5 Aug., and ratified by the U.S. Senate, 24 Sept. Neither China nor France subscribed to the treaty, although 99 other countries did so. On 20 Apr., 1964, President Johnson announced plans to cut back the production of materials for manufacturing nuclear weapons.

FRANCE AND CHINA AS ATOMIC POWERS. France became the world's 4th nuclear power when she exploded an atomic bomb on 14 Feb., 1960. In the following years France developed an independent nuclear striking force, and on 24 Aug., 1968, tested her 1st hydrogen bomb. In Oct. 1964 China tested her 1st nuclear device. U.S. Defense Secretary Robert McNamara warned, 7 Mar., 1966, that China would have warhead delivery capability in 2–3 years. China tested her 3rd nuclear weapon, 9 May, 1966, in Sinkiang. On 11 May the State Department revealed that the U.S. had rejected a Chinese suggestion that both countries pledge not to use nuclear weapons against each other. On 27 Oct., 1966, China announced the successful launching of a nuclear missile, and on 17 June, 1967, tested its 1st hydrogen bomb.

NUCLEAR MISSILE TREATIES. A U.S.-USSR agreement was signed, 27 Jan., 1967, which banned the placing of mass-destruction weapons in outer space. Although a nuclear nonproliferation treaty

was signed, 1 July, 1968, by the United States, Soviet Union, Britain, and 59 other nations, West Germany, France, and China were not among the signatories.

Economic Development and Triumphant Nationalism

NORTH AMERICA

United States

1945-50

RELIEF AND RECONSTRUCTION.

On 21 Aug., 1945, lend-lease terminated, having disbursed \$50.6 billion in aid. President Truman announced, 27 Dec., 1946, that 7 nations had made settlements. Immediately after the war the U.S. gave over \$116 billion in UNRRA, etc., loans, mostly to Eastern Europe. By a presidential directive of 22 Dec., 1945, 42,000 refugees gained admittance to the U.S.; 205,000 visas were granted for displaced persons. Secretary of State George C. Marshall proposed, 5 June, 1947, that the U.S. rebuild the world economy to enable free institutions to flourish. The resulting Marshall Plan Conference, 12 July, of 16 nations established the Committee for European Economic Cooperation, which relied heavily on U.S. support. A Foreign Aid Act, 17 Dec., 1947, granted relief to Austria, China, Italy, and France. Truman submitted to Congress, 19 Dec., a \$17 billion European Relief Program (ERP). The "Point 4" program, also outlined by Truman, provided economic assistance to underdeveloped nations.

ANTI-INFLATION MEASURES.

Price and wage controls, except those on rent, sugar, and rice, were ended by 9 Nov., 1946. Truman called, 26 July, 1948, a special session of Congress which enacted, 16 Aug., an Anti-Inflation Act. The Defense Production Act, 8 Sept., 1950, authorized Truman to fix prices and wages.

DEFENSE. On 1 Aug., 1946, the McMahon Act established the Atomic Energy Commission. The National Security Act, 26 July, 1947, combined the

army, navy, and air corps into a National Military Establishment (later Department of Defense, 1949) under a cabinet-rank secretary of defense. Military appropriations remained high in the postwar period. The Defense Reorganization Act of 6 Aug., 1958, subordinated the uniformed services to a central civilian authority.

INTERNAL SECURITY. Truman's Loyalty Order, 22 Mar., 1947, provoked an investigation of subversive activities in the Executive Branch. On 3 Aug., 1948, ex-Communist Whittaker Chambers stated that Alger Hiss had been a Communist and had given him State Department papers. Hiss received 5 years for perjury, 17 Nov., 1949. Julius and Ethel Rosenberg were convicted, 29 Mar., 1951, of atomic espionage and were executed at Sing Sing Prison, 19 June, 1953. The Internal Security (McCarran) Act, 23 Sept., 1950, passed over Truman's veto, ordered the registration of Communist organizations, the internment of Communists in national emergencies, and prohibited the immigration of anyone who had belonged to a totalitarian organization. Puerto Rican nationalists Oscar Collazo and Griselio Torresola failed in an attempt to assassinate Truman, 1 Nov., 1950.

Subsequently, a Communist Control Act, 24 Aug., 1954, deprived the Communist Party of its rights, privileges, and immunities.

TAFT-HARTLEY ACT. 23 June, 1947. Passed over Truman's veto, this act outlawed the closed shop, instituted a mandatory 60-day "cooling-off" period before strikes, and permitted employers to sue for strike damages.

PRESIDENTIAL ELECTION. 2 Nov., 1948. Republicans nominated Govs. Thomas E. Dewey (b. 1902), N.Y., and

Earl Warren (b. 1891), Calif. Democrats selected Truman and Sen. Alben W. Barkley (1877-1956), Ky. Rebellious southern Democrats nominated Gov. J. Strom Thurmond (b. 1902), S.C., for the States' Rights ("Dixiecrat") Party. Truman (303) surprisingly defeated Dewey (189) and Thurmond (39). The Democrats regained both houses.

1951-64

22ND AMENDMENT. 26 Feb., 1951. The 22nd Amendment to the Constitution limited presidents to 2 terms in office.

PRESIDENTIAL ELECTION. 2 Nov., 1952. Gen. Dwight D. Eisenhower defeated Sen. Robert A. Taft (1889-1953), Ohio, for the Republican presidential nomination. Sen. Richard M. Nixon (b. 1913), Calif., became the vice-presidential candidate. Republicans opposed Truman's China and Korea policies, supported the Taft-Hartley Law, and took an ambiguous stance on Negro rights.

Truman declined to run for re-election, 30 Mar. and the Democrats nominated Gov. Adlai E. Stevenson (1900-1965), Ill., and Sen. John J. Sparkman (b. 1899), Ala. The Democrats attacked Taft-Hartley, supported the New and Fair Deals, and advocated federal civil-rights legislation. Eisenhower (442) soundly defeated Stevenson (89) by more than 6 m. votes. The Republicans won both houses.

"CAPTIVE PEOPLES" RESOLUTION. Congress shelved, 7 Mar., 1953, an administration resolution attacking Soviet subjugation of free peoples. Eisenhower urged, 16 Apr., Eastern European independence, but, despite East German rioting, 18-24 June, announced, 1 July, that the U.S. planned no physical intervention in Eastern Europe.

ESTABLISHMENT OF HEW. On 1 April, 1953, a new federal government department, Health, Education, and Welfare, was established.

FARM PROGRAMS. On 11 Jan., 1954, Eisenhower proposed a system of flexible price supports based on an updated parity. Legislation to this effect became law, 28 Aug. The Soil-Bank Bill, 28 May, 1956, compensated producers who kept

their 1956-59 crops below their allotments. The Agriculture Act of 28 Aug., 1958, gave farmers a choice between modified price supports and increased crop quotas.

MCCARTHY HEARINGS. Republican Sen. Joseph R. McCarthy's (1908-57), Wis., Permanent Investigating Subcommittee's hearings on Communist activities in government stirred much controversy. McCarthy attacked the Democrats, 4 Feb., 1954, for "20 years of treason." He charged that Army Secretary Robert T. Stevens and Brig. Gen. Ralph W. Zwicker had suppressed evidence of espionage at Fort Monmouth's (N.J.) Signal Corps Engineering Laboratories. Eisenhower's denunciation, 14 June, 1953, of "book burners" spurned McCarthy's tactics. The Senate "condemned," 2 Dec., McCarthy after Sen. Arthur V. Watkins', Utah, committee unanimously recommended that he be censured for contempt of the Senate Privileges and Elections Subcommittee.

• OPPENHEIMER CASE. The Atomic Energy Commission suspended, Dec. 1953, Dr. J. Robert Oppenheimer (b. 1904) as a security risk. To Gordon Grey's special AFC Committee Oppenheimer admitted having aided Communist causes, but denied being a Communist. Nuclear physicist Edward Teller (b. 1908) testified that Oppenheimer had actively opposed the H-bomb project. The committee cleared him as "loyal" but found him lacking in "enthusiasm" for the H-bomb project. As a result, he was not reinstated, 12 Apr., 1954.

HOUSING LEGISLATION. The Housing Act of 2 Aug., 1954, authorized construction of 35,000 houses for people uprooted by slum clearance. It also raised maximum permissible mortgages and lowered down payments, 1955, 1957, and 1958 Acts liberalized the law, and Eisenhower assigned \$650 m. for urban renewal, 24 Sept., 1959.

DIXON-YATES CONTRACT. Joint congressional hearings revealed that Budget Bureau consultant Adolph H. Wenzell, a vice-president of Dixon-Yates' financial agency, had taken part in negotiations which authorized, 5 Oct., 1954, the Dixon-Yates group to build a power

generating plant to supply Memphis, Tenn. Eisenhower canceled the contract, 11 July, 1955.

CIVIL RIGHTS. A bus boycott by black citizens of Montgomery, Ala., led by Rev. Dr. Martin Luther King (1929-68) began, 1 Dec., 1955. In accord with a Supreme Court order, 13 Nov., 1956, desegregated bus service began in Montgomery, 21 Dec.

The Civil Rights Act of 9 Sept., 1957, created a 6-man bipartisan Civil Rights Commission to investigate unconstitutional denials of voting rights and authorized federal district courts to issue injunctions against interference with voting.

When a federal district court nullified a state court's injunction against the integrating of a high school at Little Rock, Ark., Arkansas Gov. Orval Faubus called out the National Guard, 24 Sept., 1957, and prevented the registration of 9 black students. Rioting erupted, 23 Sept., when Faubus withdrew the troops after a federal court order not to obstruct blacks. Eisenhower sent in 1,000 airborne troops. The black students entered the school, 25 Sept. Integration, however, progressed slowly in the South.

President Kennedy used federal troops to enable a black student, James Meredith, to register at the University of Mississippi, 30 Sept.-1 Oct., 1962; ordered an end to discrimination in federally financed housing, 20 Nov., 1962, and called, 19 June, 1963, for an Omnibus Civil Rights Law.

A Civil Rights Law of 2 July, 1964, protected the right to vote and outlawed discrimination in employment and places of "public accommodation."

HIGHWAY PROGRAM. The Federal-Aid Highway Act, 29 June, 1956, provided \$32.5 billion for the construction of 42,000 miles of interstate highways and to complete the federal-aid highway system.

PRESIDENTIAL ELECTION. 6 Nov., 1956. Democrats nominated Adlai E. Stevenson for president. Sen. Estes Kefauver (1903-63), Tenn., narrowly defeated Sen. John F. Kennedy, Mass., for the vice-presidential position. Republicans renominated Eisenhower and Nixon. The party platforms were quite similar,

though Stevenson proposed an international ban on H-bomb testing which Eisenhower opposed. Eisenhower won (457-74) by over 9,500,000 votes, but the Democrats took both houses.

U.S. INTERVENTION IN LEBANON. The "Eisenhower Doctrine," promulgated 5 Jan., 1957, warned that the U.S. would permit no Communist conquests in the Middle East. Modifying a resolution by Rep. Thomas A. Gordon, Ill., the Senate authorized aiding Middle East nations to develop economic and military power. When rebellion erupted in Lebanon, 9 May, 1958, U.S. marines landed, 15 July, at President Camille Chamoun's request for aid under the provisions of the Eisenhower Doctrine.

CIVIL LIBERTIES. A restriction of the use of F.B.I. files, 30 Aug., 1957, permitted the introduction in court only of material relating to a witness' testimony.

EURATOM. The European Atomic Energy Community Act, 2 July, 1958, authorized the exchange by the U.S. with its allies of atomic information and materials.

NATIONAL DEFENSE EDUCATION ACT. 2 Sept., 1958. This act authorized \$295 m. in 3% loans to college students and 5,500 graduate fellowships for future college teachers.

LABOR MANAGEMENT REPORTING AND DISCLOSURE ACT. 14 Sept., 1959. This act sought to ensure fair union elections and end corruption, and forbade all unions to use the secondary boycott.

MEDICARE. A Medical Care Bill, 13 Sept., 1960, established a federal-state program to provide medical care for the needy aged.

1960 PRESIDENTIAL ELECTION. 8 Nov., 1960. Democrats nominated Sens. John F. Kennedy and Lyndon B. Johnson (b. 1908), Tex., and advocated medical care for the aged under Social Security. The Republicans selected Richard M. Nixon and Henry Cabot Lodge (b. 1902), Mass. Kennedy defeated Nixon, but by only 112,881 out of 68,800,000 votes cast. The official vote count, 6 Jan., 1961, gave Kennedy 303 and Nixon 219 electoral

votes. Kennedy's Inaugural Address, 20 Jan., 1961, pledged action against tyranny, poverty, disease, and war.

THE "NEW FRONTIER." Kennedy's "New Frontier" brought intellectual enthusiasm and appointees like Defense Secretary Robert S. McNamara and Labor Secretary Arthur J. Goldberg to Washington. However, Congress rejected much of his program, including medical aid for the aged.

ASSASSINATION OF JOHN KENNEDY. 22 Nov., 1963. Lee Harvey Oswald allegedly shot Kennedy as he rode in a motorcade in Dallas, Tex., and was himself killed by civilian Jack Ruby while in custody. Vice-President Johnson succeeded Kennedy.

ECONOMIC OPPORTUNITY ACT. 30 Aug., 1964. This act established a youth Job Corps to implement Johnson's "war on poverty."

PRESIDENTIAL ELECTION. 3 Nov., 1964. Conservative-dominated Republicans nominated Sen. Barry M. Goldwater (b. 1909), Ariz., and Rep. William E. Miller, N.Y. Democrats nominated Johnson and Sen. Hubert H. Humphrey (b. 1911), Minn. Johnson crushed Goldwater by approximately 16 million votes. In his State of the Union Message, 4 Jan., 1965, Johnson called for redoubled efforts against poverty, disease, discrimination, and ignorance, in order to achieve a "Great Society."

1965-68

VIETNAM. The U.S. assumed the major responsibility for defending South Vietnam's government against the Vietcong. In Feb. 1965 President Johnson authorized bombing attacks on North Vietnam. By 1968 more than 500,000 American soldiers were in Vietnam. The war became increasingly unpopular as U.S. combat deaths rose, and many condemned it as an unnecessary, imprudent, and even immoral involvement in non-American affairs. Opponents of the war frequently demonstrated in the nation's cities (*pp.* 591-596 *above*.)

U.S.-COMMUNIST RELATIONS. The Vietnam war slowed the trend to-

ward better relations with the Communist world, but both sides acted with restraint. In the 6-day war, June 1967, the U.S. supported Israel while the USSR encouraged the Arab states, but the leaders of the superpowers maintained direct communications to avoid a confrontation. President Johnson and Premier Aleksei Kosygin held a summit meeting at Glassboro, N.J., 23-25 June, 1967, which helped to reduce tensions. North Korea's seizure of the U.S. Navy intelligence ship *Pueblo* and its 83-man crew exacerbated deteriorating relations between the countries; the crew was released, 22 Dec., 1968, after 10 months of negotiations and a U.S. apology, later retracted, for spying. Russia's invasion of Czechoslovakia, Aug. 1968, led the U.S. Senate to delay consideration of the pending Nuclear Non-proliferation Treaty.

GREAT SOCIETY. Large Democratic majorities in both houses of the 90th Congress gave President Johnson legislation which he deemed necessary to create the "Great Society" promised in his State of the Union Message, 4 Jan., 1965. "Medicare," financed through Social Security, provided hospital insurance for those Americans over age 65. The Voting Rights Act authorized the attorney general to send federal registrars to enroll Negroes in states which violated the 15th Amendment. A new immigration act replaced the national-origins quota system with a less ethnically discriminating scale of priorities. Republican gains in the 1966 elections and the increasing costs of the Vietnam war reduced the output of domestic legislation in the latter half of the Johnson years.

BLACK AMERICA. Younger black leaders, like Stokely Carmichael, H. Rap Brown, and Eldridge Cleaver, called for "Black Power," a slogan expressive of black pride and militancy. Riots in the ghettos emphasized Negro dissatisfactions. Los Angeles, Aug. 1965, Cleveland, July 1966, and Detroit and Newark, July 1967, suffered scores of deaths and millions of dollars in property damage due to racial disturbances. President Johnson's Special Advisory Commission on Civil Disorders reported, Feb. 1968, that white racism

underlay problems which threatened to tear the nation asunder. Black Americans made some gains as the Republican, Edward Brooke, was elected Senator for Mass., and as black Democrats Carl Stokes and Richard Hatcher won election, Nov. 1967, as mayors of Cleveland, Ohio, and Gary, Ind., respectively.

POLITICAL ASSASSINATIONS. Murderers continued to fell American public leaders. Black Muslims allegedly shot, 21 Feb., 1965, Malcolm X, leader of the rival Black Nationalists, as he spoke in Harlem. On 4 Apr., 1968, Rev. Martin Luther King, Jr., a moderate Negro leader, was shot to death in Memphis, Tenn., where he was encouraging support for the city's striking sanitation men, mostly blacks. James Earl Ray, a white American, was later extradited from London and convicted of the crime. On 5 June, 1968, Sen. Robert F. Kennedy (N.Y.) was fatally wounded in the Ambassador Hotel in Los Angeles as he left celebrations of his Democratic presidential primary victories in California and South Dakota. Bystanders captured his alleged assailant, Sirhan B. Sirhan, a Jordanian immigrant.

DEMOCRATIC PRESIDENTIAL NOMINATION. Sen. Eugene McCarthy (Minn.), an opponent of the war in Vietnam, stunned President Lyndon B. Johnson by gathering 42% of the vote, 12 Mar., 1968, in New Hampshire's Democratic primary. Sen. Robert F. Kennedy, another critic of the administration, soon entered the contest, 16 Mar. When the President surprisingly withdrew, 31 Mar., from the race, his Vice-President, Hubert Humphrey, announced his candidacy, 27 Apr. Sen. George McGovern (S.D.), another "dove," joined the fray after Kennedy's assassination, 5 June. Meeting at Chicago, 26-29 Aug., the Democrats nominated Humphrey and Sen. Edmund T. Muskie (Me.). The convention endorsed President Johnson's Vietnam policy while police clashed with antiwar demonstrators in the streets of Chicago.

PRESIDENTIAL ELECTION. At Miami Beach, Fla., Republicans nominated, 8 Aug., former Vice-President

Richard M. Nixon with Maryland Gov. Spiro T. Agnew, as his running mate. Although more conservative, the Republican platform was similar to the Democratic on the issues of war, the urban crisis, and law and order. Nixon won the election, 5 Nov., with only 43.4% of the popular vote, as an ultraconservative 3rd party, running former Alabama Gov. George C. Wallace and retired Air Force Chief of Staff Gen. Curtis LeMay, gathered 13.5%. Nixon received 302 electoral votes, Humphrey 191, and Wallace 45. The Democrats retained control of both houses of Congress.

SPACE EXPLORATION. In June 1965 Maj. Edward White left the Gemini 4 capsule commanded by Maj. James McDivitt for 20 minutes, thus becoming the 1st American to "walk" in space. Lt. Col. Gordon Cooper and Lt. Comm. Charles Conrad established several space endurance records during an 8-day flight in Aug. 1965. On 1 June, 1966, the U.S. "soft-landed" Surveyor 1, a research craft, on the surface of the moon. Tragedy struck, 27 Jan., 1967, when a fire in the Apollo 1 capsule killed astronauts Virgil Grissom, Edward White, and Roger Chaffee during a launch practice. The U.S. achieved a great space triumph in Dec. 1968, when Col. Frank Borman, Capt. James Lovell, and Maj. William Anders took Apollo 8 into orbit around the moon, at a distance of less than 70 miles from its surface. They ended their 6-day journey on 27 Dec., landing safely in the Pacific Ocean (moon landing, p. 652).

Canada

1945-47

1945 ELECTIONS. On 2 Feb., 1945, Prime Minister W. L. Mackenzie King's government received a setback with the defeat of Defense Minister A. G. L. McNaughton (1887-1966) in a parliamentary by-election. On 23 Feb. the government canceled 9 parliamentary by-elections due on 23 Apr. in favor of general elections in the summer. Elections in June gave the Liberal Party 119 seats. Parliament opened on 6 Sept.

ROSE CASE. In Feb. 1946, Fred Rose, Polish-born Communist M.P., was arrested and charged with violating the official-secrets acts by turning over secret information to the Russians. He was convicted on 15 June.

RELAXATION OF WARTIME CONTROLS. On 31 Jan., 1946, the government lifted price ceilings on over 300 consumer goods and relaxed controls over wages of office workers and factory workers. On 10 July the government took over the Dominion Steel and Coal Corp., the Steel Company of Canada, and Algoma Steel Corp., to meet strike threats. On 29 Nov. wartime controls on wages and salaries were removed, but price controls were retained. During the period 10 Apr.-15 May, 1947, there was a 400,000-man drop in unemployment. On 25 May a strike of 13,000 coal workers in Nova Scotia ended with a pay raise. On 30 Sept., all army, naval, and air forces changed from a wartime to a peacetime footing and the army changed its name from Canada Active Service Force to Canada Army Active Force. During 1947, price controls were removed from many items—household articles, fresh vegetables, fruit and fish, dairy products, restaurant meals, textile and leather products, bakery items, tea, and coffee. By Sept. most curbs were off. Canada also passed regulations relating to the immigration of displaced persons during 1947.

1948-55

ST. LAURENT REGIME. In Sept. 1948 Lester Pearson (b. 1897) became state secretary for external affairs, and Louis Stephen St. Laurent (b. 1882) served as acting premier and justice minister while King was abroad. On 15 Nov., King resigned and St. Laurent became prime minister. On 3 Aug., 1949, it was announced that "Dominion" had been dropped from the name of Canada on government letterheads and official documents. On 17 Oct. all wartime controls on foods ended.

On 27 June, 1949, St. Laurent's Liberal Party won 193 of the 262 seats in Commons, the Progressive Conservatives win-

ning only 45. In Oct. parliamentary by-elections gave the Liberals 4 seats, the Independents 3, and the Progressive Conservatives 1. The fiscal year ending 31 Mar., 1950, showed a \$111-million budget surplus and a dollar exchange reserve of more than \$1.24 billion. A deadline of Apr. 1951 was set for the ending of rent control.

On 15 Sept., 1950, Parliament adjourned after a 16-day special session in which it (1) doubled the defense budget to \$850 million, (2) called all of the country's regular armed forces to active duty, (3) gave the government power to control essential materials and services, and (4) approved government restraints on consumer installment buying as an anti-inflationary measure.

In Jan. 1951 Canada's population exceeded 14 million for the first time, and Canadian exports achieved a peacetime record of \$3,118.4 million. On 26 Apr. the Liberal Party won elections in Prince Edward Island. On 25 June Conservative candidates unseated 4 Liberals in parliamentary by-elections by assailing the government for the high cost of living. The Commons now had 185 Liberals, 46 Progressive Conservatives, 13 Co-operative Commonwealth Federalists, 10 Social Credit Party members, 4 Independent Liberals, and 4 independents.

The national elections of 10 Aug., 1953, were won by the Liberals, their 5th consecutive victory. The House of Commons now consisted of 171 Liberals, 50 Conservatives, 23 Co-operative Commonwealth Federalists, and 15 members of the Social Credit Party.

VALUE OF THE CANADIAN DOLLAR. On 19 Sept., 1949, the Canadian dollar was devalued from U.S. \$1.00 to U.S. \$.90. On 30 Sept., 1950, it was freed to find its own level on the world market. By 5 Oct. it had risen on the New York exchange to U.S. \$.94½. The Canadian dollar was freed because of the country's strong gold reserve of \$1,798 million, up \$534 million during the preceding 3 months.

APPOINTMENT OF MASSEY AS GOV. GEN. On 24 Jan., 1952, Vincent Massey (1887-1967), Canadian high com-

missioner in London, 1935-46, and chancellor of the University of Toronto since 1947, was appointed to succeed Field Marshal Viscount Alexander as gov. gen. Massey was the 1st Canadian appointed to the post.

1956-62

CONSERVATIVE VICTORY OF 1957.

On 30 Oct., 1956, the Progressive Conservatives won the provincial elections in Nova Scotia for the 1st time in 23 years. On 14 Dec., John Diefenbaker (b. 1895) was elected leader of the Progressive Conservative Party at a convention in Ottawa. National elections held on 10 June, 1957, resulted in the loss of the Liberals' 170-seat majority in the Canadian Federal House of Commons. The Liberals won 104 seats and the Conservatives 109. Diefenbaker formed a new government on 17 June.

AWARD OF NOBEL PRIZE TO PEARSON. On 14 Oct., 1957, ex-External Affairs Secretary Lester B. Pearson won the 1957 Nobel Peace Prize. Although no reason was given by the committee, it was understood that he was honored principally for his efforts in 1950-53 to halt the Korean War, for his leadership in creating the UN Expeditionary Force to enforce the truce in the Middle East, and for efforts to strengthen the military and nonmilitary functions of NATO.

DIEFENBAKER REGIME. On 16 Jan., 1958, Pearson succeeded St. Laurent as Liberal Party leader. Elections held on 30 Mar. resulted in an overwhelming victory for Diefenbaker's Conservatives over Pearson's Liberals. On 8 Apr. the Gordon Commission, set up by Parliament to survey Canada's economic future, reported that Canada's trade would be primarily geared toward the U.S. within the next 25 years, to the detriment of her sales to Britain and Europe. On 18 Jan., 1960, Prime Minister Diefenbaker, in his 1st major message to Parliament, called for alterations in the British North America Act designed to broaden Canada's right to amend its constitution without the sanction of the British Par-

liament. On 4 Aug. a Canadian Bill of Rights was approved unanimously by the House of Commons.

NEW DEMOCRATIC PARTY. At a convention in Ottawa, 31 July-4 Aug., 1961, the New Democratic Party was formed by an amalgamation of the 1-million-member Canadian Labor Congress, members of the old Socialist Farmers' Co-operative Commonwealth Federation, and various intellectuals dissatisfied with both the Conservative and Liberal parties.

IMMIGRATION LAW. 19 Jan., 1962. New immigration regulations were issued, abolishing discrimination based on race, color, or religion. Immigrants now were to be judged solely on education, training, and skills.

MACKENZIE TERRITORY. The Northwest Territories Council (Little Parliament of the North) approved, 1962, a proposal to create by 1964 within its own 1.3-million-sq.-mi. territory a new 580,000-sq. mi. self-governing area to be called Mackenzie Territory. This territory would have its own governing council and a resident commissioner.

FALL IN FOREIGN RESERVES. In June 1962 the government devalued the dollar to a par value of U.S. \$0.92½. The step was taken to discourage the continual drain on foreign-exchange reserves. On 24 June Diefenbaker announced plans to borrow \$1 billion abroad to bolster the Canadian dollar and an austerity plan designed to reduce the budget deficit and the deficit in Canada's balance of payments.

1963-68

FALL OF THE DIEFENBAKER GOVERNMENT. On 5 Feb., 1963, Diefenbaker's Conservative government was overthrown by a vote of no confidence. The defeat resulted from a bitter domestic and U.S.-Canadian dispute begun by a statement, 30 Jan., by the U.S. State Department which was critical of Ottawa's reluctance to accept American nuclear weapons for joint U.S.-Canadian defense of North America and for Cana-

dian units in NATO forces. Diefenbaker was overthrown by a Social Credit Party motion, approved by a 142-111 vote, which stated that his government had failed to give a clear statement of Canada's national defense policy. A Liberal motion of no confidence was then passed by the same 142-111 vote. In elections held 8 Apr. the Liberals fell 5 votes short of the majority required before they could automatically replace the Conservative government. The Liberals won 128 seats to the Conservatives' 96. Diefenbaker resigned, 17 Apr., and Pearson was sworn in, 22 Apr., as prime minister.

NEW CANADIAN FLAG. On 15 Feb., 1965, the new maple-leaf flag was raised for the 1st time. It was meant to symbolize the desired unity between French- and Anglo-Canadians.

POLITICS IN QUEBEC. 1966. On 16 June Daniel Johnson (1915-68) of the conservative Nationale Union replaced Jean Lesage (b. 1912) as premier of Quebec. In the 108-seat Quebec Legislative Assembly, there were now 55 Nationale Union members and 51 Liberals. In a news conference, Sept., Johnson discussed his "2-nation" theory and asked for more internal control for Quebec.

EXPO 67. A highly successful international exposition was held in Montreal, 1967.

ACCESSION OF TRUDEAU. On 6 Apr., 1968, Justice Minister Pierre Elliott Trudeau (b. 1921) was elected leader of the Liberal Party and sworn in as prime minister, 20 Apr. He dissolved Parliament, 28 Apr. In the general elections held on 25 June, the Liberals won a decisive victory.

LATIN AMERICA

Argentina

1945-55

THE AGE OF PERÓN. After demonstrating his overwhelming support among the ragged masses (*descamisados*), Juan Domingo Perón was elected, 24 Feb., 1946, president of Argentina. Perón in-

augurated one of the most remarkable regimes in the history of Latin America. Under the cloudy ideology of *justicialismo*, Peronism proved a semifascist variant of extreme nationalism, built upon the twin pillars of labor (with mass involvement) and the army. Its nationalism took diplomatic ("3rd position") and economic forms (nationalization of telephones, 1946, railroads, 1948). Its statist economic policies, bent on industrialization at all cost, disastrously neglected agriculture, the source of nearly all foreign exchange. Wheat production declined from 8.2 metric tons in 1941 to 2.3 in 1950; agricultural and pastoral production declined 50%, 1946-52. Perón tolerated no organized opposition of any kind.

Until her death (26 July, 1952) Perón's wife, María Eva Duarte de Perón, was nearly his coruler, with labor unions, newspapers, and state welfare under her personal control. His (unsuccessful) attempt to impose her as his vice-president, 1951, alienated part of his crucial military support. The effects of his calamitous economic policies, his turning to foreign capital in an attempt to solve them (Standard Oil of Calif., 1953), and his growing anticlericalism (after an earlier harmonious relationship with the church) solidified opposition against him. He was deposed by a military coup, 19 Sept., 1955.

1955-68

THE LEGACY OF PERÓN. Neither Perón's military nor civilian successors were able to deal with his working-class supporters, who remained loyal, a source of continuing indigestion in the body politic. After the military regime of Gen. Pedro E. Aramburu, 1955-58, attempted to disperse the *peronistas* by suppression, civilian Radical Arturo Frondizi, 1958-62, tried to reintegrate them into traditional politics (while seeking to stabilize and reinvigorate the economy). After elections, 18 Mar., 1962, which demonstrated *peronista*-bloc strength, the military judged the attempt a failure and ousted Frondizi, 29 Mar. The army remained the

arbiters through the uneasy administration of Arturo Illia, 1963-66, finally unseating him, 29 June, 1966, and installing Gen. Juan Carlos Onganía, 30 June, at the head of a new repressive dictatorship.

Chile 1942-64

THE POLITICS OF INFLATION. A runaway inflation, beginning during World War II and accelerating during the 1950's, reflected fundamental structural problems within Chile's democracy. Neither the governments of traditional politicians—Radicals Juan Antonio Ríos, 1942-46; Gabriel González Videla, 1946-52; and Liberal Jorge Alessandri Rodríguez, 1958-64—nor of a former dictator, now elected president—Carlos Ibáñez, 1952-58—could simultaneously achieve development and stability. The economy was not strong enough to support the demands that the government was too weak to refuse. Inflation masked the neglect of basic social and economic problems.

1964-68

EDUARDO FREI AND CHRISTIAN DEMOCRACY. As the long economic crisis wore on, Chile's electorate grew increasingly disenchanted with its traditional politicians of the center and right. In the 1958 elections, they had narrowly selected Alessandri over Salvador Allende, candidate of the Marxist FRAP coalition. In 1964, they turned massively to the progressive Christian Democrats and Eduardo Frei Montalva, who, in an essentially 2-man race with Allende, was the 1st president in the century to win more than 50% of the vote. The effect of this, and subsequent congressional elections, 1965, was to break the mold of traditional politics. Despite stiff opposition from the combined right and left, the Christian Democrats, a nonclerical reformist Catholic party, began a frontal assault on fundamental problems. The purpose of "Chileanization" of copper, Dec. 1964,

principal source of foreign exchange, was to assure adequate funds for development. The government assumed greater control, but did not nationalize the U.S.-run mines, in exchange for promises of \$500-m. new investment and doubled production by 1970. Important land reform, education, and community development legislation was enacted.

Uruguay and Paraguay 1945-68

STABILITY AND STAGNATION IN URUGUAY. In 1952 Uruguay replaced its presidential form of government with a 9-man executive National Council, which was operative until 1966, when the more conventional executive was restored. In the 1958 election the Nationalist Party (Blancos) ousted the Colorados from control of the national government for the 1st time in 93 years. The Colorados returned to power in 1966. Neither party under either constitutional arrangement seemed able to halt spiraling inflation (the price index rose from 100 in 1958 to 393 in 1963), the drain of the state's welfare burden, economic stagnation (especially wool and meat production), and the concomitant social unrest and frequent strikes.

PRÆTORIAN STATE IN PARAGUAY. Ruled since 11 July, 1954, by Gen. Alfredo Stroessner, Paraguay continued as an isolated, backward, peaceful dictatorship.

Bolivia 1945-64

THE MNR AND SOCIAL REVOLUTION. On 9-11 Apr., 1952, a widespread popular uprising led to the recall from Argentina of Victor Paz Estenssoro, exiled leader of the Bolivian National Revolutionary Movement (MNR). In the following decade the MNR presided over and partially directed the beginnings of a painful transformation of this poorest of South American countries. In his 1st term

Paz Estenssoro made suffrage universal; disbanded the army and armed a civilian militia; nationalized the tin mines, source of foreign exchange (COMIBOL, Oct. 1952); and, partially compelled by Indian uprisings, instituted an important land reform, 2 Aug., 1953. The social goals—rapid economic development and the integration of the Indian into national life—were laudable and supported financially by the U.S. The economic effects of revolutionary policies, however—declining agricultural production and an unparalleled inflation (average of 57.3% per year, 1951-60)—created grave new social problems and sharp rifts within the MNR. President Hernán Siles Zuazo, 1956-60, and Paz in his 2nd term, 1960-64, forced by economic necessity to austerity measures, were increasingly repressive. In 1963 labor leader Juan Lechín withdrew from the MNR. On 4 Nov., 1964, Gen. René Barrientos Ortuño headed a junta that ousted Paz and he assumed the presidency, 6 Nov.

1964-68

THE MILITARY IN POLITICS. Despite armed clashes between the army and tin miners, 1965, Ortuño was able to consolidate his hold over the government, and he was elected president in the national election held on 3 July, 1966. Ortuño's government was shaken by the publication of the captured war diary of Ché Guevara, who was killed by Bolivian troops, 9 Oct., 1967. Following the disclosure that a government minister had released the diary, a state of siege was declared, and on 27 July, 1968, an all military cabinet was appointed.

Peru and Ecuador

1945-62

APRISTA INFLUENCE IN PERU. Although representing a majority of popular opinion in the country and with the fundamental support of President José Luis Bustamante, 1945-48, the Aprista Party was unable to carry through its

economic or social legislation against the dogged opposition of Peru's traditional oligarchy. Gen. Manuel Odría (president, 1948-56) deposed Bustamante, outlawed the Apristas, and ruled without pretense of democracy. His elected successor, Manuel Prado, 1956-62, lacked the political advantage of high export prices from which Odría had benefited and ran into increasing economic difficulties.

1963-68

BELAÚNDE TERRY. After the military annulled the results of the 1962 presidential elections (in which Aprista leader Haya de la Torre had a plurality), another election was held, 9 June, 1963, and Fernando Belaúnde Terry of Acción Popular was elected. Lacking the traditional military enmity toward Haya, Belaúnde was able to enlist the support of progressive elements within the armed forces for social programs often largely appropriated from the Apristas. Belaúnde's inability to cope with a severe financial crisis and his imposition of a settlement with American oil interests, which offended nationalist army officers, led to a coup on 3 Oct., 1968. The civilian government was replaced by a "Revolutionary Government" composed of military men.

INSTABILITY IN ECUADOR. The apparent beginnings of constitutional succession begun by the reformist and democratic administration of Galo Plaza Lasso, 1948-52, were ended by a series of military coups in the 1960's. The Indians remained unintegrated into the nation, the economy underdeveloped, and politics traditionally personalistic and unstable.

Colombia and Venezuela

1946-57

VIOLENCIA IN COLOMBIA. A split in the Liberal Party allowed the Conservative, Mariano Ospina Pérez, to be elected president, 1946. Almost immediately the government began purging Liberal offi-

cials, increasingly making use of the army and police. The persecution aroused Liberal resistance and set in motion a dialectic of violence unparalleled in Latin America in the 20th cent. An estimated 200,000 people died in more than a decade of civil war, banditry, and class warfare. The *bogotazo*, an immense riot which destroyed all of central Bogotá (\$500 m. damage, 1,500 killed), followed the assassination of the Liberal leader, Jorge Eliécer Gaitán, 9 Apr., 1948. The semifascist repression initiated by President Laureano Gómez, 1950–53, intensified hostilities and finally led to intervention by the army, June 1953. An inept attempt by Gen. Gustavo Rojas Pinilla to reshape Colombian politics in a Peronist mold united students, church, and both parties against him. He was ousted, May 1957.

DEMOCRACY AND DICTATORSHIP IN VENEZUELA. After a brief period of reformist rule, 1945–48, the Acción Democrática (AD) party was overthrown by the military, Nov. 1948. Emerging from the ruling junta, Col. Marcos Pérez Jiménez established a personal dictatorship, 1950–58, which was politically brutal and economically irresponsible. On 23 Jan., 1958, Pérez Jiménez fled in the face of overwhelming popular pressure.

1958–68

COLOMBIAN NATIONAL FRONT. The *Violencia* destroyed the fabric of Colombian society without producing a revolutionary government. On 7 Aug., 1958, Liberal Alberto Lleras Camargo, 1958–62, began the unique National Front, a constitutional arrangement for 16 years during which the 2 traditional parties would alternate in the presidency and otherwise divide all political offices equally between them. The agreement did bring greater stability but no concerted action to deal with the effects of the social upheaval. It remained to be seen if the Liberal Carlos Lleras Restrepo, 1966–70, would be more successful in attacking fundamental problems than

the “do-nothing” administration of the Conservative Guillermo León Valencia, 1962–66.

AD AND VENEZUELAN DEMOCRATIC REFORM. Ruling in coalition with the Christian Democrats (COPEI), AD's Rómulo Betancourt, 1959–64, brought Venezuela planned economic development, significant social reform, and—in the face of guerrilla terror on the left and army pressure on the right—determinedly democratic government. Betancourt cut illiteracy from 50% to 21%, carried out agrarian reform, fostered labor organization and industry profit sharing, built the huge Guayana City industrial complex, and began to utilize Venezuela's enormous oil receipts to diversify the economy. Venezuela's 1st elected civilian president in history to finish his term, Betancourt turned over his office to former AD labor leader Raúl Leoni, 11 Mar., 1964. The coalition government broke down, Mar. 1966, with the AD's partners charging that they were not being permitted a large enough role in the government. Leoni was able to form another government, however, and continued to advance AD programs.

Brazil

1945–54

DUTRA. On 25 Oct., 1945, President Getúlio Vargas was deposed to assure the return of democracy. In Dec. Gen. Enrico Dutra was elected. He proved an unimaginative chief executive. Policy was shaped largely by the clash between the formerly dominant agricultural and mercantile interests and the nationalistic industrialists that had emerged during the Vargas era. The Constitution of 1946 established a federal system but included many provisions for social welfare pioneered by Vargas.

RETURN OF VARGAS. Vargas, re-elected president, Oct. 1950, found leading a democratic government, with a hostile Congress, difficult (although he succeeded in founding the state oil monopoly, PETROBRAS, in 1953). Beset

by a declining demand for exports and a threatened military coup, Vargas committed suicide, 24 Aug., 1954.

1956-64

KUBITSCHKE AND GROWTH. Juscelino Kubitschek won a narrow plurality in the presidential election of Oct. 1955 and, following a "preventive" coup to ensure his succession, took office in Jan. 1956. He brought the country rapid economic growth, especially of infrastructure (average growth 7.2% per year, 1956-60); built the new national capital of Brasília (dedicated Apr. 1960), opening the interior for development; attacked regional imbalance with a new development agency (SUDENE, headed by Celso Furtado) for the poverty-stricken northeast; and generally favored growth over stability. Brazil paid a price: rapid inflation (cost of living up 211%, 1956-60) and neglect of social development leading to increasing unrest.

DRIFT TO THE LEFT. Elected as a reformer in Oct. 1960 and promising an "independent" foreign policy, Jânio Quadros resigned enigmatically, 25 Aug., 1961. His successor, his leftist and independently elected vice-president, João (Jango) Goulart, took office after strong resistance from the military and amid rising tensions. His inability to deal with the inflation (more than 80%, 1963; 20% per month, 1964) and his drift to the left led to his ouster by the military in a broadly supported coup, 31 Mar.-2 Apr., 1964.

1964-68

"REVOLUTIONARY" GOVERNMENT BY THE ARMY. With the coup the military moved from its position as prompter in the wings, where it had been since 1945, to the center of the political stage. President Humberto Castelo Branco, 11 Apr., 1964-15 Mar., 1967, assumed far-reaching decree powers, deprived of political rights some 9,000 public figures, abolished existing political parties, re-established close ties with the

U.S., and adopted conservative austerity remedies for inflation. After the indirect election and installation of Marshal Arthur da Costa e Silva as president, 15 Mar., 1967, there were some signs that the military might relax its direct hold over the nation.

Central America

1945-68

MEXICO. With the governments of Miguel Alemán, 1946-52, and Adolfo Ruiz Cortines, 1952-58, the civilian heirs of the Mexican revolution turned to the right, sacrificing social reform to economic development. The economic results were impressive: the most diversified economy in Latin America, with a high rate of sustained and balanced growth (average, 6.5% per year, 1951-60), and "Mexicanized" control of key sectors. But the level of real wages in 1958 was actually lower than in 1939, and in 1956 46% of school-age children were still not in school. Adolfo López Mateos, 1958-64, reversed the trend somewhat, channeling more of the budget into social investments, stepping up land redistribution more than any president had done since Cárdenas, and instituting profit sharing for labor (though using the army to break a rail strike, Apr. 1959). The guarantee of congressional seats to opposition parties, 1964, by Gustavo Díaz Ordaz (president, 1964-70) emphasized not the liberality of the government party (PRI) but rather its continuing inability to allow genuine democracy.

STUDENT UNREST. Dissatisfaction with heavy-handed police behavior and infringements on student autonomy led to violent street fighting between students and police-military contingents. July 1968. As the fighting extended through the summer into Oct., the demonstrators were able to force a government reappraisal of parts of the penal code, as well as a pledge to uphold university autonomy.

GUATEMALA. The progressive regime of Dr. Juan José Arévalo, 1945-51,

began a decade of social change. Arévalo instituted social security and a labor code, restored civil liberties, encouraged the formation of labor and peasant unions, and attempted to integrate the Indians (50% of the population) into the national life. His successor, Col. Jacobo Arbenz Guzmán, 1951-54, moved further left, fell under Communist influence, and repressed opposition. His agrarian reform, July 1952, struck at the extensive holdings of the United Fruit Co., and alarmed the U.S., which helped arm the "liberation army" that overthrew him, June 1954. Between 1954 and 1968, 2 military and 2 civilian regimes have for the most part tried to avoid the problems raised by the revolution. From 1967 onward guerrillas were active in the countryside.

EL SALVADOR. Since a junior officers' coup, 13 Dec., 1948, El Salvador has had moderate military government, with economic development, stability, some social reform, and a degree of political freedom. With the exception of the period 26 Oct.-1960-24 Jan., 1961, when a more extreme military faction seized power, rule was lodged mainly with 2 government parties, PRUD, 1950-60, and PCN, 1961 onward. Resistance from the tiny but entrenched civilian oligarchy, added to the military's own fears of instability, prevented fundamental change.

COSTA RICA. After winning a 2-month civil war, 1948, and restoring the government to the president-elect, José Figueres was himself elected president in 1953. His *aprista*-type National Liberation Party (PLN) implemented a program of agricultural, industrial, and educational development, abolished the armed forces, and democratically turned over office in 1958 when the Conservative opposition (PUN) won a narrow victory. A change of presidents also occurred following the 1962 (PLN) and 1966 (PUN) electoral contests.

NICARAGUA. Despite the assassination of the long-time dictator, Anastasio (Tacho) Somoza in 1956, Nicaragua continued to be run like a private fief by his surviving family.

HONDURAS. Following a coup by restless junior officers, 1956, the Liberal,

Ramón Villeda Morales, 1957-63, instituted a brief period of change in his poverty-stricken country. When his party appeared certain to win re-election, the army, desirous of regaining direct control, staged a coup, 3 Oct., 1963.

PANAMA. After a short period of reform under José Remón, 1952-55, Panama's politics continued to be characterized by electoral successions and extreme personalism. A growing sense of nationalism was demonstrated by the anti-U.S. riots of Jan. 1964. A new Canal Treaty followed, 24 Sept., 1965. In Mar. 1968 the National Guard, which supported the National Liberal Party government, prevented the National Assembly from removing President Robles from office. Robles' candidate in the May elections was defeated, but the National Guard overthrew the victor, President Arnulfo Arias, on 11 Oct., 1968. Charging that Arias had attempted to reshuffle the Guard's leadership, the National Guard replaced the president with a junta of senior officers.

The Caribbean

1945-68

THE CUBAN REVOLUTION. Following the ineffective and corrupt elected regimes of Ramón Grau San Martín, 1944-48, and Carlos Prío Socarrás, 1948-52, Fulgencio Batista, 10 Mar., 1952-31 Dec., 1958, built a dictatorship on the support of the army, organized labor, and the U.S. After 3 years of guerrilla warfare, he was overthrown by Fidel Castro, who gradually instituted the most sweeping social revolution in the history of the hemisphere.

The revolution in Cuba was not so much the events that brought Castro to power as the direction taken thereafter. The Agrarian Reform, 17 May, 1959, was a crucial turning point. It was intended to achieve Cuba's "economic independence" by nationalizing the vital sugar industry and estates (principal source of foreign exchange), diversifying agriculture, and distributing land to the landless. Its executive agency, INRA, largely run by the revolutionary army, soon assumed the

larger task of administering all nationalized properties (Cuban and foreign) and reorganizing the whole economy under state control. Anti-Batista moderates had left all top government posts by July 1959, gradually being replaced by members of the Communist Party (PSP). In July and Oct. 1960 all large foreign and Cuban businesses were nationalized (est. \$1 billion U.S. property). The 15 Oct., 1960, Urban Reform limited income from rentals to \$600 a month, driving middle-class *rentiers* into exile. But living conditions for the poor improved.

The effect of the U.S.-USSR confrontation over Cuba, 1961-62, was to accelerate its government's movement toward East European Communist models. Castro proclaimed Cuba a "socialist" country, 1 May, 1961, and himself a "Marxist-Leninist," 2 Dec., 1961. In Feb. 1961 a Ministry of Industry had been founded (headed by Ché Guevara) to carry out economic centralization and industrialization. This policy proved a failure. Importing raw materials for Cuban-produced manufactures was more expensive than importing finished goods from abroad. Serious food shortages provoked internal dissention and "Revolutionary Tribunals" were established, May 1962, to deal with economic crimes. But Castro was alert to the dangers of losing the authentically Cuban character of the revolution (and his own leadership of it). He denounced PSP leader Anibal Escalante, 26 Mar., 1962, when the Communists attempted to co-opt the new single government party (ORI, later PURS). The limits on his control, however, were emphasized by the big-power settlement of the Oct.-Nov. 1962 missile crisis.

Castro's May 1963 visit to Moscow resulted in his reversing Cuba's development priorities. Terming its past policy "economic cretinism," Cuba agreed to return to intensive sugar production (which had fallen from 6.8 m. tons to 3.8 m. during 1961-63). The 2nd Agrarian Reform, 2 Oct., 1963, expropriated the land of some 10,000 medium farmers and shifted the ownership balance to 70% state, 30% private. Cuba's youth, who had taken part in a successful mass literacy campaign in 1961, were subject,

after 12 Nov., 1963, to compulsory military service. The government's purposes were essentially to mobilize a cheap source of labor and to socialize the youth into revolutionary values. After Nov. 1964, more old-line Communist leaders were eliminated from power in government (Castro himself replacing INRA head Carlos Rafael Rodríguez). As of 1968, Castro remained at the center of the revolution, with his vast popular support largely intact.

DOMINICAN REPUBLIC. After the assassination of Trujillo, 30 May, 1961, the Dominican Republic struggled to overcome the effects of his brutal 31-year dictatorship—feeble institutions and powerful armed forces. The reformist democrat, Juan Bosch, landslide victor in the Dec. 1962 elections, was ousted after only 8 months in office, 27 Feb.-25 Sept., 1963. A popular revolt, including junior officers led by Col. Francisco Caamaño Deñó, overthrew the conservative Donald Reid Cabral regime, 24 Apr., 1965. Out of fear of "another Castro," the U.S. encouraged Trujillo's old officers to counter-attack, 26 Apr., and then, for the 1st time since 1926, intervened directly, landing marines, 28 Apr. Some 20,000 invasion troops presided over 4 months of civil war (ending 31 Aug., 1965). On 1 Mar., 1966, Joaquín Balaguer, a puppet premier under Trujillo, defeated Bosch in an OAS-supervised presidential election.

HAITI. Beginning in 1957 François Duvalier ("Papa Doc") replaced the traditional dictatorship of the Garde d'Haïti by a reign of terror at the hands of his *Tons-Tons Macoutes* (voodoo secret police), driving foreign capital and the educated elite abroad and intensifying the misery of the masses.

AFRICA

North Africa

1956-68

TUNISIA. On 25 July, 1957, about 1 year after Tunisian independence, the Legislative Assembly abolished the monarchy and appointed Habib Bourguiba head of state pending preparation of a new con-

stitution. Bourguiba initiated social reforms, granting full equality to all citizens and placing persons of all religions under the same secular law. During 1956-57, the state took over religious and tribal lands for distribution to individual farmers; and in Nov. 1958, the government began compulsory repurchase of land belonging to European settlers.

On 1 June, 1959, the constitution established Tunisia as a republic; in the Nov. elections, Bourguiba was returned as president at the head of a Neo-Destour government. Late in 1959, Bourguiba began a labor mobilization program, under which thousands of urban unemployed returned to their home provinces to carry out public works projects.

In 1961, when the French extended their base at Bizerte, Bourguiba called for evacuation and blockaded the base. The French retaliated with a paratroop attack which inflicted heavy casualties on Tunisian troops and prestige. Tunisia then took the case to the UN, which backed her position; and France agreed to evacuation, effective 1963. In Oct. 1964, the Neo-Destour held its 7th congress, at which the party was reorganized and renamed the Parti Socialiste Destourien (PSD). The national elections in Nov. returned Bourguiba as president and approved a single list of PSD candidates for the Assembly.

ALGERIA. Algerian independence, July 1962, came in the midst of an economic crisis resulting from war and from the exodus of the French who had operated the commercial economy. In addition, there was an open split in the FLN. In July the GPRA was established in Algiers with Ben Khedda as premier. But Ben Bella withdrew from the government and, with the support of the army under Col. Houari Boumédiène, organized his own Political Bureau. By Sept. Ben Bella had attained effective control of the country. He initiated a socialist economic policy under which Algerian peasants took over estates abandoned by the French and operated collective farms with the help of state-directed management committees. By the end of 1963, Algeria began to nationalize foreign-

owned land and industry, although the economy continued to depend on French aid and French co-operation in exploitation of Saharan oil.

During 1963, Ben Bella consolidated his political position, bringing the Communist Party and the trade unions under FLN control and putting down revolts in the Kabyle region. In Sept. 1963, Algerian voters approved a new constitution which designated the FLN as the sole legal party, with the right to name a single list of candidates for president and National Assembly. In July 1964, revolts broke out again in the Kabyle and Biskra areas, in opposition to the excessive personal power of the president. On 19 June, 1965, Col. Boumédiène removed Ben Bella in a bloodless coup, suspended the constitution and the Assembly, and assumed the presidency at the head of a 26-man Conseil National de la Révolution. Boumédiène began to restructure the FLN and adopted a more gradual economic policy designed to ensure financial stability and attract foreign investment.

MOROCCO. The 1st year of independence, 1956, was devoted to restoration of public order, as the sultan and predominantly *Istiqlal* government put down dissidence in both urban and rural areas. Then the general unrest began to crystallize into organized political movements. Late in 1957, the Mouvement Populaire emerged in rural and Berber regions, advocating a doctrine of "Islamic socialism"; the party received legal recognition after a revolt in the Rif in 1958. Also in 1957, a split began to appear within *Istiqlal*; and in the summer of 1959, Mehdi Ben Barka joined trade unionists and other *Istiqlal* secessionists in the Union Nationale des Forces Populaires (UNFP), which was committed to a more radical economic and social policy than *Istiqlal* under Al Fassi.

Party rivalry brought renewed disorder, until King Mohammed announced, May 1960, that he was taking control of the government. After Mohammed's sudden death in Feb. 1961, the crown prince assumed power as King Hassan II. In Dec. 1962 a popular referendum ratified a

new constitution which gave extensive authority to the monarchy and established a Legislative Assembly with limited power.

In preparation for the elections of May 1963, Ahmed Reda Guedira formed a new royalist party, the Front pour la Défense des Institutions Constitutionnelles (FDIC). The FDIC led, but failed to win an effective majority in the elections; and the new government under Prime Minister Ahmed Bahnini met constant challenges from the UNFP, which had boycotted the constitutional referendum, and from *Istiqlal*, which questioned the election returns. Guedira's regrouping of FDIC elements into the Parti Socialiste Démocratique (PSD), Apr 1964, failed to strengthen his position significantly, and the Assembly continued to debate while economic and social conditions deteriorated. In Mar. 1965 the populace expressed its frustration by riots in Casablanca; in June Hassan suspended the constitution and himself took control as prime minister. He retained this post until July 1967, when he rearranged the cabinet and appointed Mohammed Ben-hima prime minister.

West Africa

1957-68

GUINEA. Guinea's rejection of the de Gaulle constitution, 1958, led to an immediate withdrawal of French technical and financial aid and consequent deterioration in economic conditions. The country became a 1-party state, Dec. 1958, when opposition parties merged with Sekou Touré's Parti Démocratique de Guinée (PDG). On 1 May, 1959, Guinea entered into a union with Ghana, as part of their common pan-African policy, and received a £10 m. Ghanaian loan. During 1960 Guinea withdrew from the franc zone and signed commercial and cultural agreements with various Communist countries. But nationalization and Communist aid proved largely ineffective; and in Dec. 1961, Touré expelled the Soviet ambassador for alleged plotting against his government. By Dec. 1962 Guinea was

drawing closer to the West again in the hope of developing the country's promising bauxite and iron ore resources, although Touré received a new Soviet ambassador, Mar. 1962, and has continued to insist on Guinean nonalignment. In Mar. 1966 Touré gave asylum to deposed Ghanaian president Nkrumah and designated him co-chief of state, apparently a nominal position.

GHANA. At independence in 1957, Nkrumah's CPP governed Ghana with a program stressing national unity and socialist economic development. Opposition from traditional tribal and religious leaders, private cocoa farmers, and middle-class intellectuals coalesced into the United Party, to which, the government responded by trying to concentrate power in the CPP. In 1958 an Industrial Relations Act placed national labor unions under central control, and a Preventive Detention Act set aside the right to free trial. Several opposition leaders were detained under the latter act in 1959.

In Apr. 1960, a plebiscite chose a republican constitution with Nkrumah as president. In 1961 falling world prices for Ghana's principal export, cocoa, increased the balance-of-payments problem and necessitated an austerity budget. In Sept. and Oct. the government repressed protest strikes by railway and dock workers. Nkrumah persisted in his policy of heavy investment in large, long-term development projects, including the Volta River hydroelectric power and aluminum smelter project, begun in 1962, and in spite of pressing domestic problems, he continued to devote considerable attention to leadership in the pan-African movement.

In a Supreme Court trial, Dec. 1963, Chief Justice Sir Arku Korsah acquitted 3 men accused of treason. Nkrumah dismissed Korsah and nullified the court's decision under a new Law of Criminal Procedure Act which was rushed through the National Assembly. On 31 Jan., 1964, a referendum approved constitutional amendments which empowered the president to dismiss judges and named the CPP as the sole national party. The CPP

adopted an increasingly militant attitude which placed ideology before reality, while corruption within its tanks undermined popular support.

By 1965 Ghana was heavily in debt abroad; in Dec. Nkrumah negotiated a 2-year moratorium on debts to Communist countries and began seeking similar arrangements with western creditors. On 24 Feb., 1966, while Nkrumah was out of the country, a group of senior army and police officers took control and established a National Liberation Council (NLC) under Gen. Joseph Ankrah. The NLC outlawed the CPP, suspended the constitution, and dissolved the Assembly. It canceled the economic plan and announced a policy of stabilization by reduced government spending. Aid from western countries eased Ghana's balance-of-payments deficit.

NIGERIA. Regionalism continued to dominate Nigerian politics after independence in 1960. Chief Awolowo, leader of the Action Group in the federal Parliament, challenged the regional system when he tried to gather behind him all the more radical elements in the country who opposed the Balewa government's economic program and pro-western foreign policy. Chief Akintola, premier of the Western Region and deputy leader of the Action Group, opposed Awolowo. The party split open in May 1962, when Akintola lost both his positions. During the ensuing violence, the federal government declared a state of emergency in the west and began a long trial which ended with Awolowo's imprisonment for treason, Sept. 1963. Meanwhile, Jan. 1963, Akintola had been reinstated as western premier and had formed the Nigerian National Democratic Party (NNDP), a coalition of his followers and the NCNC.

On 1 Oct., 1963, Nigeria became a federal republic with 4 regions, including the Mid-West Region which had been created in May. The Parliament elected Azikiwe president. Two main groups opposed each other for the 1st national elections, 30 Dec., 1964: the Nigerian National Alliance (NNA), led by Ahmadu Bello, combined the NPC, NNDP, Mid-West Democratic Front, and small eastern opposition parties; and the

United Progressive Grand Alliance (UPGA), led by eastern premier Michael Okpara, brought together the NCNC, Action Group, and northern opposition parties. The campaign became a north-south contest, marked by violence, and on 28 Dec. the UPGA announced that it would boycott the elections because of irregularities in nominating candidates in several constituencies. With a fraction of the electorate voting, the NNA won an overwhelming majority. President Azikiwe hesitated to acknowledge these results, but after intensive discussions with various political leaders, he announced, 4 Jan., 1965, that a compromise had been reached whereby Prime Minister Balewa would form a government and supplementary elections would be held in doubtful constituencies. The elections, held 18 Mar., brought UPGA representation in Parliament to 108 against 197 for NNA, but failed to end unrest.

On 15 Jan., 1966, a group of eastern junior army officers carried out a coup in which Balewa, Bello, and Akintola were assassinated. By 17 Jan., Maj. Gen. Johnson Aguiyi-Ironsi, commander in chief of the army, had suppressed the revolt. He banned political parties and established a military government. On 29 July, northern soldiers in a countercoup killed Ironsi and replaced him with Lt. Col. Jakubu Gowon. This action was followed by riots and the slaughter of thousands of easterners living in the north and by a mass exodus of easterners to their home region. Lt. Col. Odumegwu Ojukwu, governor of the Eastern Province, challenged the legitimacy of the new regime; and relations between the federal government and the east deteriorated. On 30 May, 1967, the east seceded and proclaimed itself the independent Republic of Biafra. On 6 July fighting broke out between federal and eastern troops, and continued during the rest of 1967 and throughout 1968.

Democratic Republic of the Congo

1960

SITUATION AT INDEPENDENCE.

The Congo became independent on 30 June, 1960, with an excellent economic

potential and an explosive political situation. The atmosphere was one of apprehension and mutual suspicion between the Belgian and African communities. In addition, the Africans, with almost no training in western politics and with extravagant expectations of the benefits of "independence," were themselves divided into numerous tribes.

ARMY MUTINY AND BELGIAN INTERVENTION. On 5 July, 1960, African soldiers in Léopoldville and Thysville mutinied against their European officers in protest against their unchanged status and low wages. The next day the prime minister, Patrice Lumumba, promoted all soldiers 1 grade but failed to halt the spread of the mutiny into Lower Congo, where European civilians were attacked. On 7 July frightened Belgians began leaving the Congo. On 9 July, as the mutiny spread to other parts of the country, the Belgian government decided to send troops to protect its citizens; Belgian soldiers arrived the next day in Elisabethville, Luluabourg, and other centers of violence. On 11 July Lumumba and President Joseph Kasavubu, who were touring the disturbed areas trying to restore peace, agreed to accept the Belgian troops if they restricted themselves to protecting Europeans. But on the same day, Belgian ships bombarded Matadi, which had already been evacuated by Europeans; and Belgian forces supported Katanga in a declaration of secession under Moïse Tshombe. On 12 July, after they had been refused permission to land at Elisabethville, Lumumba and Kasavubu requested UN intervention against Belgian aggression. The first UN troops arrived, 15 July, the Belgians began to withdraw from Léopoldville, and a measure of order was restored.

FALL OF LUMUMBA. On 5 Sept., 1960, Kasavubu, with UN and western support, dismissed Lumumba, who had been seeking Russian aid to invade Katanga and restore national unity. Lumumba in turn dismissed Kasavubu, and in the resultant confusion Col. Joseph Mobutu of the Armée Nationale Congolaise (ANC) replaced them both, 14 Sept.,

with a College of Commissioners composed of university graduates and students. Lumumba, who opposed the new government, was confined to his residence, while Kasavubu began to come to an understanding with the College. Two of Lumumba's supporters, Antoine Gizenga and Christophe Gbenye, began working in Stanleyville, Nov., to set up a rival government; by the end of the month, they had established control over Orientale Province. Lumumba himself escaped, 27 Nov., but was captured by Mobutu's troops, 2 Dec., and imprisoned at Thysville.

1961-68

KATANGA SECESSION. On 17 Jan., 1961, the Léopoldville authorities transferred Lumumba to Elisabethville, where he was murdered. The event aroused anger throughout Africa and brought a new UN resolution to return the Congo to parliamentary government. President Kasavubu negotiated with Katangans and Lumumbists, and on 2 Aug. a new government was formed with Cyrille Adoula as prime minister and Gizenga as deputy prime minister. During Sept. fighting broke out in Katanga when UN forces under Conor Cruise O'Brien attempted to remove foreign mercenary troops. In Oct., after disagreement with the Adoula government, Gizenga returned to Stanleyville and rallied support in Orientale; but in Nov. some army elements turned against him, bringing about his arrest and imprisonment, Jan. 1962. In Dec. 1961 Adoula met with Tshombe, who consented to Léopoldville's demands for reunification but then delayed implementation of the agreement after returning to Katanga.

UN AND U.S. INTERVENTIONS. In Mar. 1962 Adoula and Tshombe began negotiating again, but the talks broke off without agreement in June. On 3 Sept. Tshombe accepted a UN proposal for reunification, but again postponed implementation. On 28 Dec. UN forces renewed military action, and on 14 Jan., 1963, Tshombe announced the end of Katanga's secession and went into exile.

But unrest continued throughout the Congo. In Apr. trade-union leaders were arrested after the threat of a general strike. In Sept. Kasavubu declared Parliament closed; and in Oct. several opposition leaders were arrested, while others escaped to Brazzaville, where they formed a Comité National de Libération (CNL) to plot the overthrow of the Adoula government.

During early 1964, insurrections which had begun in Kwilu, Dec. 1963, spread to Orientale and Kivu, where local guerrillas fought the ANC. In June Tshombe returned from exile to announce that he could bring about a compromise. Kasavubu appointed him prime minister, 10 July; but no compromise was reached and, after the rebels captured Stanleyville in Aug., Tshombe requested and received U.S. air support. In Oct. the ANC, reinforced with mercenaries, moved into Eastern Congo; in Nov., with the help of a U.S. airlift of Belgian paratroopers, the ANC took Stanleyville and the rebellion began to peter out.

COUP BY MOBUTU. In Feb. 1965, preparing for the Mar.-Apr. legislative elections, Tshombe joined several parties into the Convention Nationale Congolaise (CONACO). Opposition Lumumbist parties formed the Alliance des Mouvements Nationalistes Congolais Lumumba. Because of voting irregularities in some districts, the opening of the new National Assembly was delayed from 30 June to 20 Sept., during which time a power struggle between Kasavubu and Tshombe grew increasingly evident. When the Assembly did open, a deadlock developed between supporters of the 2 rivals and persisted until 25 Nov., when Mobutu executed a coup. He took power as president and minister of defense, appointed Col. Leonard Mulamba prime minister and commander in chief of the ANC, and announced that he would rule for 5 years by decree subject to parliamentary approval. On 26 Oct., 1966, Mobutu dismissed Mulamba, assumed the functions of prime minister himself under a presidential regime, and began building a new single party, the Mouvement Populaire

de la Révolution (MPR). During the latter half of 1967, a rebellion by white mercenaries temporarily threatened stability, but crisis was averted when the OAU intervened to bring about evacuation of the mercenaries to Ruanda, Oct.

South Africa

1945-68

ADOPTION OF APARTHEID POLICY. At the end of 1947, the National Party published a pamphlet advocating *apartheid*, a policy of "preserving and safeguarding the racial identity of the white population of the country; of likewise preserving and safeguarding the identity of the indigenous peoples as separate racial groups, with opportunities to develop into self-governing national units. . . ." Its principles included segregation of ethnic groups into their own areas, with Africans working in cities regarded as temporary migrants without the political or social rights of white residents. The Nationalists, led by Malan, won the election of May 1948 and replaced Smuts's United Party government. Although his more militant supporters favored complete territorial separation of the races, Malan rejected this policy as impracticable, since the South African economy depended on African labor. Instead, the government initiated legislation for increasingly stricter control over relations among the races, including prohibition of mixed marriages, 1949, population registration, 1950, and provision of separate housing areas, 1950.

REACTION OF NONWHITES. Opposition to this legislation drew together all nonwhites, especially after enactment of the Suppression of Communism Act, 1950, which was so generally worded as to constitute a common threat. On May Day, 1950, the African National Congress (ANC) and the South African Indian Congress joined to sponsor a strike, during which 18 people were killed. In 1951 legislation restricted Africans to unskilled jobs; in 1952 the pass laws were tightened. In 1952 also, ex-Chief Albert

Luthuli, an advocate of racial co-operation, became president of ANC, from June until the end of the year, thousands of African, Indian, and Colored demonstrators violated *apartheid* laws and went to prison in a defiance campaign.

During 1953, new laws segregated transport facilities and schools and forbade Africans the right to strike. In that year, a group of whites split off from the United Party to form the Liberal Party, which demanded a universal franchise and a Bill of Rights. In 1954 Johannes Strijdom, a representative of the more extreme Transvaal branch of the National Party, was elected prime minister. In June 1955 a multiracial Congress of the People met near Johannesburg to demand equal rights and opportunities for all South Africans. Leaders of the Congress, including Luthuli, were among the 156 people arrested for treason in Dec. 1956 and held until their trial ended in acquittal, Mar. 1961. During that time, the revolutionary leadership was immobilized and dissension arose within the movement, culminating in the formation, Apr. 1959, of the Pan-Africanist Congress (PAC), an exclusively African party opposed to co-operation with other racial groups or with the Communists.

BANTUSTAN POLICY. Meanwhile, more restrictive laws were passed. In 1956 Coloreds were removed from the common voters' roll, and in 1957 the Immorality Act provided for stricter regulation of social intercourse. In 1958 Strijdom was succeeded by Hendrik Verwoerd, who advocated a positive approach to *apartheid* through "separate development." The Promotion of Bantu Self-Government Act, 1959, provided for eventual creation of 8 self-governing African territories (Bantustans) and abolished the 1936 agreement which had allowed qualified Africans to elect 3 white representatives to Parliament. Also in 1959, the Progressive Party emerged as another offshoot of the United Party; it called for a universal franchise with high but non-racial qualifications.

SHARPEVILLE. On 21 Mar., 1960, Africans gathered at Sharpeville to

demonstrate against the pass laws. Police fired into the crowd, killing 72 people and injuring about 186. The government outlawed the ANC and PAC, proclaimed a state of emergency which suspended habeas corpus, and embarked on mass arrests. On 15 Mar., 1961, South Africa withdrew from the Commonwealth after other members expressed objection to her racial policies; on 31 May the country adopted republican status.

ECONOMIC PROSPERITY AND INTERNAL SECURITY. Outside pressure on the republic increased as more African states gained independence and pressed their case against South Africa in the UN and other international bodies, and provided more bases for African revolutionaries in exile. South Africa stiffened her laws: the Bantu Laws Amendment Act, 1963, further curtailed African rights and the General Law Amendment Act, 1963, allowed detention of persons for 90 days without trial. In addition, the republic pressed on with efforts to attain economic self-sufficiency. The country had achieved spectacular growth in the postwar period: exploitation of rich mineral resources provided export income (particularly from gold, which makes up some 70% of exports) and a basis for industrial development, which was increased by substantial domestic investment and the use of abundant cheap labor. But as of 1968, the economy remained dependent on imports of some industrial supplies and oil; hence, in spite of political differences, South Africa was careful to maintain good economic relations with western nations, which bought her exports and sent in foreign capital.

THE TRANSKEI. In Nov 1963 the Transkei became the 1st Bantustan, after popular election of 46 of the 109 members of its Legislative Assembly. The Transkei Assembly received jurisdiction over some local matters (subject to approval by the republic), but control of foreign affairs and security remained with the central South African government. The partition of the country under the Bantustan policy was opposed by the United Party and became the major issue

in the Mar. 1966 election. But the National Party emerged stronger than ever, with 126 out of 170 seats in Parliament.

ASSASSINATION OF VERWOERD.

On 6 Sept., 1966, Verwoerd was stabbed to death, but there was apparently no political motive on the part of the white assassin, who was ruled insane. John Vorster replaced Verwoerd as prime minister.

Other Independent States

1955-68

ZAMBIA. Northern Rhodesia became the Republic of Zambia, 24 Oct., 1964, with Kaunda as president. His UNIP was the only effective political party, holding 55 out of 75 seats in the National Assembly. Copper exports (2nd largest in the world) gave the country a favorable balance of trade, but the resulting income was poorly distributed. Most of the people remained subsistence farmers or unskilled mine workers, while wealth was concentrated in the foreign-controlled Copperbelt. Kaunda's government immediately announced an agreement under which the British South Africa Co., in return for £4 m. compensation, surrendered to the Zambian government the mineral rights which had been yielding some £15 m. a year in royalties. With UN aid, the government was drawing up plans for balanced growth when Rhodesia's Unilateral Declaration of Independence, Nov. 1965, created a new series of economic problems. In 1965 Zambia had depended on the jointly owned Rhodesian Railways to carry copper exports and 96% of imports, among which coal and oil were particularly vital. After UDI, Zambia began to develop domestic coal deposits and sought to reorient trade routes through Tanzania and Congo. By the end of 1968, all Zambian oil imports came on these alternate routes, but some 75% of other imports continued to pass through Rhodesia.

TANZANIA. Just after Tanganyika's independence in Dec. 1961, Julius Nyerere demonstrated his dedication to

political party development by resigning as prime minister to devote his full time to leadership of TANU. After he was elected president under the republican constitution which went into effect on 9 Dec., 1962, he continued to work to combine all elements of Tanganyikan society into a single-party structure which would retain the traditional African concept of government by consensus.

In Jan. 1964 a revolution in Zanzibar ended with power in the hands of Abeid Karume's Afro-Shirazi Party, which supported union with Tanganyika. In Mar. the 2 countries joined in the United Republic of Tanganyika and Zanzibar, renamed Tanzania in Oct. Karume was named vice-president, and his party became a branch of TANU.

On 5 Feb., 1967, following a meeting of TANU leaders in Arusha, Nyerere made his Arusha declaration on self-reliance. He stated that the way to economic development in a poor, agricultural country such as Tanzania was not through dependence on foreign capital with its attached conditions, but through hard work in the countryside by the Tanzanians themselves. He then nationalized foreign-owned commercial banks and other firms and large industrial and agricultural establishments, promising fair compensation.

On 1 June, 1967, Nyerere met in Kampala with the presidents of Kenya and Uganda to sign a 15-year East African Co-operation Treaty, which established an East African Community to take over and continue the communications, finance, commerce, industry, and social and research services which had been operated on a regional basis since 1961 by the East African Common Services Organization (EACSO). The treaty also provided for an East African Common Market and Development Bank.

UGANDA. On 9 Oct., 1963, when the post of governor general was abolished, the Kabaka of Buganda, Sir Edward Mutesa II, became president while Obote remained prime minister. The alliance between Kabaka Yekka and UPC continued but grew increasingly uneasy, and

UPC steadily built its strength until by Dec. 1965 it held 67 of the 91 seats in the National Assembly. On 24 Feb., 1966, moving to combat his enemies within the coalition, Obote suspended the constitution, and on 2 Mar. he assumed all powers of government. On 15 Apr., Parliament adopted a new constitution which provided for a president at the head of a unitary state, abolishing the federal status of Buganda and the other kingdoms. Obote was elected president. Upon the outbreak of violence in Buganda, he declared a state of emergency and sent in troops who captured the palace, 24 May, and the Kabaka fled the country. On 8 Sept., 1967, the Assembly approved another new constitution, which made Uganda a republic with a president having broad executive power.

KENYA. Kenya became a republic on 12 Dec., 1964, as a *de facto* 1-party state, since KANU had by then absorbed all opposition parties. Kenyatta was elected president and Oginga Odinga vice-president. During 1965 signs appeared of increasing tension between the radical, anti-western Odinga and the more moderate politicians, particularly Tom Mboya, minister of economic planning and development and secretary general of KANU. At a party conference in Mar. 1966, the post of deputy president, which had been held by Odinga, was eliminated. On 14 Apr. Odinga announced his resignation as vice-president of Kenya; and in the following days, 3 cabinet members and several trade-union leaders and members of the National Assembly resigned from KANU in support of Odinga, who took over as president of a new opposition party, the Kenya People's Union (KPU). Mboya engineered a constitutional amendment requiring the 29 KANU defectors in the Assembly to get affirmation of their constituents' continuing support in special elections which were held in June. KPU, facing the established KANU Party organization, emerged with 9 seats.

ETHIOPIA. The end of World War II found Ethiopian sovereignty completely restored and Emperor Haile Selassie firmly in control, with power to initiate

legislation and to appoint the prime minister, senators, judges, and other government officials. In Nov. 1955 a revised constitution provided for election of deputies to the lower chamber of Parliament by universal suffrage. In the elections of 1957, there were still no political parties, but rather factions all of which sought the emperor's help.

In Dec. 1960, during the emperor's absence, some officers of the Imperial Bodyguard attempted a coup which failed when the army and air force opposed them. The populace rejoiced at the return of Haile Selassie, stronger than ever. During 1961 the emperor quieted some of the remaining discontent by distributing several ministerial portfolios, recognizing trade unions, and appointing commissions of investigation into administration and land reform; but modernization in Ethiopia continued to be hindered by feudal, religious, and political institutions and by a traditionalist approach to agricultural production. In 1963 the emperor prevailed upon Eritrea to become an integral part of the empire, giving up the federal status it had held since 1952. Also in 1963, he enhanced his pan-Africanist stature by acting as host to the 1st meeting of the Organization of African Unity at Addis Ababa.

SUDAN. At independence in 1956, Sudan faced serious problems of internal unity: ethnically, culturally, and linguistically, the country was divided between the Arab Moslem north and the tropical African south influenced by Christian missionaries; politically, temporary alliances were formed on the basis of personalities or interest groups, rather than clearly defined party ideologies.

Ismail al-Azhari of the NUP was replaced as prime minister, 5 July, 1956, by Abdullah Khalil at the head of an uneasy coalition between 2 northern conservative parties, Umma and the People's Democratic Party (PDP). In Feb. 1957 the government aroused southern resentment by announcing a policy of cultural integration under which missionary schools would be absorbed into a national system. In 1958 Sudan faced an economic crisis resulting from accumulated unsold stocks

of cotton, which normally contributed more than 60% of exports, and falling world cotton prices. On 17 Nov., 1958, with the support of some political leaders, Gen. Ibrahim Abboud occupied government offices in a bloodless military coup. He suspended the constitution, dissolved Parliament and political parties, and established a Supreme Council of the Armed Forces.

The new government survived 3 attempted coups in 1959; but during the next few years, trade unionists, civil servants, and students grew increasingly discontented with the pervasive military rule. Southern opposition and demands for autonomy also increased. Southern leaders in exile in neighboring countries formed the Sudan African National Union (SANU) under William Deng. Inside Sudan, an underground movement, *Anyanya* (a poisonous insect), took shape in the south in 1963; its acts of terrorism in 1964 met with violent repression by the central government. In Oct. 1964, student demonstrations in Khartoum were supported by a Professional Front of civil servants and a general strike. The Abboud regime was replaced by a civilian caretaker government under Sir al-Khatim al-Khalifa, which achieved an interim agreement with the southern provinces and arranged elections for Apr.-May 1965. On 14 June the resulting Constituent Assembly elected Mohammed (Muhammad) Ahmad Mahgoub of the dominant Umma Party as prime minister.

The Mahgoub government failed to deal effectively with renewed violence in the south and continuing economic and social discontent throughout the country. In July 1966 political infighting brought about Mahgoub's replacement by Umma Party President Saddiq al-Mahdi at the head of a coalition of Umma and NUP. In May 1967 Saddiq's government fell, primarily because of opposition by the various political factions to his plans for a new constitution providing for a strong president elected by direct popular vote. Mahgoub took over again and named a coalition government which included representatives of Umma, NUP, PDP, and the southern parties.

MIDDLE EAST

Turkey

1945-68

DEVELOPMENT OF POLITICAL PARTIES. In Turkey the postwar years witnessed the emergence for the 1st time of opposition parties, the most important of which was the Democratic Party, founded on 7 Jan., 1946. On 14 May, 1950, the 1st completely free elections, contested by several parties, took place, with the Democrats winning a large majority of the seats, thereby ending the almost 30-year rule of Atatürk's Republican People's Party. The fact that the RPP allowed such an election to take place seemed to bode well for democracy in Turkey. Early in 1952 Turkey was admitted to full membership in NATO, underscoring its membership in the European community. On 2 May, 1954, a 2nd election resulted in another victory for the Democratic Party, but in Oct. a split developed in the ranks of the party and led to the formation of the Freedom Party by the dissident elements. The elections of 27 Oct., 1957, reflected the beginnings of dissatisfaction with the Democrats; although the party received a plurality of the seats, it did not have an absolute majority of votes cast.

MILITARY COUP OF 1960. On 27 May, 1960, a coup led by Gen. Gursel overthrew the regime, and he became president. The leading members of the Democratic Party were tried for treason, and several of them, including Adnan Menderes, the former prime minister, were executed. The military did not, however, wish to remain in power indefinitely, and a new assembly was convened, Jan. 1961, to act as a temporary Parliament until a new constitution was ratified, 26 May. Elections held on 15 Oct., 1961, resulted in the formation of a coalition government in which a new party, the Justice Party, was represented. On 22 Feb., 1962, there was an abortive military revolt by officers in Ankara who wished a military take-over, but this was

put down, as was a similar attempt on 21 May, 1963. The Justice Party received a majority in the elections held in 1965.

CYPRUS. The problem of Cyprus, with its considerable Turkish population, was a source of continuous concern to Turkey in the postwar years. The island had become a British crown colony in 1925, and on 16 Aug., 1960, became an independent republic. Growing pressure for the union of Cyprus with Greece resulted in armed clashes between Greek and Turkish Cypriots, and the question came before the UN, which sent an international force, the 1st contingents of which arrived on 14 Mar., 1964. Although this eased the situation somewhat, the next years did not witness any permanent solution of the problem.

Iran

1945-68

RELATIONS WITH THE USSR. The conclusion of World War II found Russian troops still in occupation of the northern part of the country, and in the fall of 1945 there were disturbances in Azerbaijan, which was under Soviet control. On 12 Dec., 1945, the governor of Tabriz was deposed and an autonomous Republic of Azerbaijan proclaimed with Soviet support. At about the same time an independent Kurdish republic was established in Mahabad. On 4 Apr., 1946, Iran came to terms with the Soviet Union, signing an agreement which provided for the withdrawal of the Soviet troops. In return Iran agreed to the establishment of an Iranian-Soviet oil company to develop the northern provinces. On 9 May, 1946, the Soviet army withdrew, and on 15 Dec. the regime in Azerbaijan collapsed. On 22 Oct., 1947, the *Majlis* refused to ratify the agreement, and it remained a dead letter. In Feb. 1950 land reform, which was to continue over the next decade and a half, began with the handing over by the shah of the royal estates for redistribution.

OIL ROYALTIES. Perhaps the most crucial events that took place in Iran in this period revolved around the question

of oil royalties. The agreement with the Anglo-Iranian Oil Co., signed in 1933, was revised, 17 July, 1949, but the new agreement was not ratified by the *Majlis*, which felt the increase in the percentage of profits was not large enough. On 20 Mar., 1951, the *Majlis* passed a law nationalizing the oil industry, which the shah was forced to sign. On 29 Sept., after negotiations had failed, Britain took the case to the UN, and on 3 Oct. the last British company personnel were evacuated. The question was finally settled, after the overthrow of the government in Iran by a military coup, 19 Aug., 1953, by a new agreement, 5 Aug., 1954. This provided for a division of the profits on a 50-50 basis.

REFORM POLICIES. Further land-reform laws were passed as part of the so-called "White Revolution" of the shah and his advisers, and on 20 Aug., 1960, the Office of the Land Reform came into being. On 17 Sept., 1963, a new Parliament was elected, and on 21 Jan., 1965, the prime minister was killed by a member of an extremist religious sect, indicating that the reform policy of the shah and the government was not approved in all quarters.

Egypt

1945-68

EXTERNAL RELATIONS. The efforts of Egypt in the years immediately following the war were directed toward achieving the complete withdrawal of British troops from Egyptian soil. A treaty initiated on 25 Oct., 1946, was not signed by the Egyptians because it did not provide for the British to leave the Sudan. Following the defeat of Egyptian forces in the 1st Arab-Israeli War of 1948, an armistice was signed with Israel, 24 Feb., 1949, but a permanent peace settlement was never made. On 15 Oct., 1951, Egypt unilaterally abrogated the Anglo-Egyptian Treaty of 1936, and it was not until 12 Feb., 1953, that an agreement was signed between the 2 powers for self-determination in the Sudan. This was followed on 19 Oct., 1954, by an agreement concerning

the Suez Canal Base, under the terms of which British forces were to withdraw within 20 months but retained the right to return under certain conditions.

ACCESSION OF NASSER. Internally Egypt was going through a series of upheavals that resulted in radical changes. Increasing dissatisfaction with the monarchy led on 23 July, 1952, to a coup by a group of colonels in the Egyptian army, and on 26 July the king abdicated. On 18 June, 1953, the monarchy was abolished and Egypt became a republic. Gamal Abdel ('Abd al-) Nasser emerged as the leader of the movement and, assuming the presidency, 14 Nov., 1952, immediately began making changes. On 8 Sept., 1952, an agrarian reform decree was issued, followed by the abolition of the *Waqfs* (lands held in perpetual trust, usually for the ultimate benefit of some religious institution or good work). On 10 Dec., 1952, the old constitution was abrogated, and it was not until 23 June, 1956, that a new one came into existence.

SUEZ CRISIS OF 1956. One of Nasser's most cherished schemes was the construction of a high dam at Aswan to increase the cultivable land of the country. When on 17 July, 1956, the U.S. refused a loan it had earlier promised for the dam, he reacted swiftly and violently. On 26 July he seized and nationalized the Suez Canal. The situation was further complicated on 29 Oct. when Israeli forces invaded Egypt, and on 31 Oct. Britain and France began air attacks which were followed by the landing of troops in the Canal Zone. On 1 Nov. Egypt blocked the Canal, on 6 Nov. a cease-fire was accepted, and a UN force was dispatched, 15 Nov. The dispute over the use of the Canal itself was not settled until 18 Mar., 1957. On 9 Jan., 1960, work was begun, with large-scale Soviet aid, on the Aswan Dam.

ESTABLISHMENT OF UAR. Egypt had long seen itself as the leader of the movement for Arab unity and made several attempts to establish its position formally. On 1 Feb., 1958, the United Arab Republic was formed by a union with Syria which lasted until the withdrawal of the latter, 28 Sept., 1961. On 17

Apr., 1963, an agreement for an Arab Socialist Union comprising Egypt, Syria, and Iraq was signed, but dissensions among the member countries rendered it ineffective. Nasser was re-elected for a 6-year term on 15 Mar., 1965, but with diminished prestige because of the deteriorating economic situation in Egypt and because of the defeat of the Egyptian armed forces in the 3rd Arab-Israeli War, 1967.

Iraq

1945-68

INTERNATIONAL RELATIONS. The evacuation of the last British troops from Iraq, Oct. 1947, marked the real beginning of Iraqi independence, and on 16 Jan., 1948, a treaty was signed between the 2 countries by the terms of which the British were to withdraw from the air bases they had previously held. This treaty was not, however, ratified, due largely to the Arab-Israeli War of 1948. In 1950 a Development Board was set up which was to receive 70% of future oil royalties. These were to be used for land development. On 3 Feb., 1952, a new agreement was signed with the Iraq Petroleum Co. giving Iraq 50% of the profits. On 24 Feb., 1955, Iraq joined a mutual defense pact with Turkey to which Britain adhered, 30 Mar. The Anglo-Iraqi alliance of 1930 was abrogated.

ESTABLISHMENT OF THE REPUBLIC. Iraq was not exempt from the revolutionary fever current in the Middle East, and on 14 July, 1958, the monarchy was overthrown. King Faisal II and his prime minister, Nuri al-Sa'id, were killed and Iraq was made a republic. On 24 Mar., 1959, Iraq withdrew from the Baghdad Pact. In Mar. 1961 the 1st of a new series of Kurdish rebellions that were to continue for the next 5 years broke out. On 8 Feb., 1963, the government of Gen. Kassem was overthrown and Arif, a leader of the Ba'ath Party, became president. On 17 Apr., 1963, Iraq joined with Syria and Egypt in the National Socialist Union, and on 29 Apr., 1964, a new constitution came into being. In June 1966 a cease-fire

with the Kurds was effected, and on 30 June, 1966, an attempted coup was put down.

Jordan

1945-68

CREATION OF THE KINGDOM OF JORDAN. On 25 Apr., 1946, the amir of Transjordan took the title of king, and on 15 Mar., 1948, he signed a treaty of alliance with Britain. During the Arab-Israeli War of 1948, Abdullah's forces occupied parts of what had been the Palestine Mandate, and he annexed this territory on 1 Dec., 1948. On 26 Apr., 1949, to underscore this new acquisition Transjordan became the Kingdom of Jordan. On 20 July, 1951, Abdullah was murdered, but the monarchy remained 1st under his son Talal and then under his grandson Hussein. On 2 Jan., 1952, a new constitution was promulgated. On 1 Mar., 1956, King Hussein, in a move to gain popular favor in the face of increasing criticism of Jordanian dependence on Britain, dismissed Gen. Glubb, the commander of the Arab Legion, and on 24 Oct. Jordan signed an agreement with Egypt and Syria which placed the armed forces of these 3 countries under an Egyptian commander in chief. On 7 Apr., 1957, there was an attempted coup against the king, but Hussein put this down, 10 Apr., thereby demonstrating the viability of the monarchy. The Iraqi revolution in July 1958 produced tensions in Jordan, and the British landed forces to protect the country against the threat of external interference, but they were evacuated within a short time.

ARAB-ISRAELI WAR OF 1967. Early in the summer of 1967 Jordanian forces were defeated by Israel, and in the course of the war Jordanian territory, including the old city of Jerusalem, was captured by the Israelis.

Syria

1945-68

POLITICAL INSTABILITY AND MILITARY COUPS. Governmental instability characterized the history of Syria

in the postwar years, with a number of coups resulting in frequent changes in government. On 21 June, 1945, Syria, together with Lebanon, issued a declaration releasing all French citizens from service in the 2 countries, and French and British troops were withdrawn from Syria at the end of Apr. 1946. In July 1947, elections took place, but in 1949 there were 3 coups, resulting finally in a military dictatorship under Shishakli that lasted from 29 Nov., 1951, to 25 Feb., 1954. With the coming of a new regime the constitution, suspended in 1950, was restored, and elections held, Sept. 1954.

PARTICIPATION IN THE UAR. On 20 Oct., 1955, Syria signed a mutual-defense pact with Egypt, and on 1 Feb., 1958, in the face of the threat of growing Soviet influence in Syria, concluded a complete union with Egypt with the formation of the United Arab Republic. This union was not, however, a success, due largely to Syria's resentment at finding itself the junior partner in the arrangement and to Syrian dislike of Egyptian economic policies.

BREAKUP OF THE UAR. On 28 Sept., 1961, a coup by the Syrian army led to the dissolution of the United Arab Republic, and on 1 Dec. elections were held for a Constituent Assembly. A new series of coups in 1962 and 1963 led to the formation of a coalition government composed of army elements and members of the Ba'ath Party as well as other elements. A conflict within the Ba'ath Party itself between moderates and extremists has kept the political situation extremely fluid with constant reshuffling of governments.

Lebanon

1945-68

REVOLUTION OF 1952. Unlike its Arab neighbors, Lebanon enjoyed relative stability in the postwar years with 1 major exception. Foreign troops were withdrawn from the country by the end of 1946 and elections held in the spring of 1947. On 18 Sept., 1952, a bloodless revolution ousted President al-Khuri, who

had been in office since 1943, and a new president was elected by Parliament. The distinctive feature of Lebanese government derived from the fact that due to the heterogeneous population it had always to be composed along strictly observed sectarian lines, with certain offices traditionally going to members of specified religious groups.

CRISIS OF 1958. The crisis that arose in Lebanon in 1958 occurred over the election of a new president and coincided with the Iraqi revolution. President Chamoun wished to amend the constitution to enable him to run for a 2nd term, a proposition contested by a loosely organized National Front, which included most of the Moslem leaders of the country as well as some Christians and supporters of Arab unity. Egypt supported the rebels, who gained control of not inconsiderable parts of the country. When the outbreak of the Iraqi revolution threatened to aggravate the situation even further, the U.S. acted to preserve Lebanese independence by landing marines on 15 July, 1958. Ultimately the president decided not to seek re-election, the American troops were evacuated, and a compromise candidate was agreed upon for the office. The sectarian system of government was maintained and continued to form the basis of Lebanese stability.

Arabian Peninsula

1945-68

SAUDI ARABIA. Saudi Arabia in the years after the war concentrated largely on the development of its oil resources and on a slow but perceptible process of political and social modernization. On 30 Dec., 1950, the agreement with Aramco was revised to give the government 50% of the company's profits, and in 1956 a government-owned oil company was formed to develop areas not included in the Aramco concession. On 2 Nov., 1964, King Ibn Saud abdicated in favor of his brother Faisal, to whom he had relinquished most of his power earlier in the year. From 1962 onward Saudi Arabia was

involved in the conflict in the Yemen through its support of the Royalists there.

YEMEN. Despite several attempted coups the monarchy in the Yemen retained control until Sept. 1962, when a republican revolt broke out led by Col. Sallal. On 8 May, 1965, a republican constitution was proclaimed, but the conflict did not remain an internal one due to the support of the Royalists by Saudi Arabia and of the Republicans by Egypt. Various attempts to settle the question failed, notably at the Khartoum Conference in Sept. 1967, Egypt being anxious to withdraw its troops in the Yemen for possible use against Israel.

Israel

1945-68

ARAB-ISRAELI WAR OF 1948-49. The state of Israel was proclaimed on 14 May, 1948, the day on which Britain officially ended its mandate over Palestine, with Chaim Weizmann (1874-1952) as first president and David Ben-Gurion (b. 1886), prime minister. The new state was immediately invaded by armies from the surrounding Arab countries, but armistice agreements signed between Jan. and June 1949 left Israel in control of a great deal of Palestine. No peace treaties were negotiated, since the Arabs refused to recognize the existence of Israel. The history of Israel since its creation has necessarily been dominated by the fact that it is surrounded by hostile powers whose avowed purpose is to annihilate it.

SUEZ CRISIS OF 1956. Continuing raids by both Arabs and Israelis in the border areas marked the years after 1948, erupting into full-scale war in 1956, as a result of which Israel gained access to the sea through the Strait of Tiran. Over the course of the next decade the situation remained relatively quiet, although the Arabs made no secret of their firm intention to recapture Palestine.

ARAB-ISRAELI WAR OF 1967. On 5 June, 1967, in response to Egypt's blockade of the Strait of Tiran, Israel launched a series of campaigns against Egypt, Syria, and Jordan. In the lightning Six Days'

War, she administered crushing defeats on all 3, capturing considerable territory and matériel. A cease-fire was arranged under UN auspices, but the problem remained unsolved, the Israelis refusing to give up the positions they had taken and the Arabs still unwilling to negotiate with a government whose existence they would not concede. Meanwhile fighting continued intermittently through 1968 along the new borders.

Party in the southern Indian state of Kerala. This victory was due more to superior organization than to massive popular support. Although the Communist regime did not pursue radical policies, Kerala's Congress Party, churches, and other groups launched a nonco-operation movement which paralyzed the government and forced Indian President Rajendra Prasad to suspend Kerala's government in 1959.

SOUTH AND SOUTHEAST ASIA

India

1947-58

SITUATION AT INDEPENDENCE.

Britain partitioned her Indian empire into predominantly Hindu India and predominantly Moslem Pakistan. India's constitution provides for a federal system, with the central and state governments sharing power. The bicameral central Parliament consists of a House of the People and a Council of States. India's president is largely a ceremonial figure; real power rests in the prime minister, who heads a cabinet responsible to the House of the People.

ASSASSINATION OF GANDHI.

Known worldwide for his championing of *Ahimsa* (nonviolence), Mahatma Gandhi (1869-1948) was a prime mover in India's struggle for independence. His appeal for mutual tolerance between Hindus and Moslems alarmed Hindu extremists, one of whom killed him, 30 Jan., 1948.

PANCHA SHILA. As the Cold War intensified, Indian Prime Minister Jawaharlal Nehru pursued a nonaligned foreign policy. At the same time, he worked to promote world peace on the basis of his 5 Principles of Peaceful Coexistence (*Pancha Shila*), endorsed in a joint statement by Chinese Premier Chou En-lai, 1950. In the postwar years India led a nonaligned bloc of states with considerable influence in international affairs.

COMMUNISM IN KERALA. The biggest surprise of the 1957 general elections was the victory of the Communist

SINO-INDIAN BORDER DISPUTE.

The Sino-Indian border was never satisfactorily demarcated, and in 1959 military clashes erupted on the Himalayan frontier. A much more serious border crisis occurred in 1962, when Chinese troops staged a limited invasion of India. Continuing Chinese hostility forced India to rely increasingly on Soviet and American military aid, thus undermining Indian nonalignment. Prime Minister Nehru's death, 27 May, 1964, further diminished India's leading role in world affairs. His successor, Lal Bahadur Shastri (1904-66), was virtually unknown to the international community.

WAR WITH PAKISTAN. India fought 2 wars with Pakistan during 1965, 1 in the Rann of Kutch, the other in Kashmir. Militarily the struggles were inconclusive, but the Kashmir conflict led Soviet Premier Aleksei Kosygin to offer to mediate Indo-Pakistani differences at a summit conference in the Soviet city of Tashkent. The Tashkent Declaration, signed in Jan. 1966, pledged mutual withdrawal of forces from the battle zone and settlement of future Indo-Pakistani disputes without resort to force. As he prepared to return home from Tashkent, Prime Minister Shastri died suddenly of a heart attack. His successor was Nehru's daughter, Mrs. Indira Gandhi (b. 1917).

DECLINE OF CONGRESS PARTY.

After governing India virtually unchallenged since independence, the Congress Party suffered a serious setback in the 1967 national elections. It barely retained a majority in the central Parliament, and in more than half of the states it actually

lost its edge to opposition coalitions ranging broadly over the political spectrum. Regional and linguistic grievances, religious fanaticism, widespread poverty and hunger, and discontent with Congress' increasingly corrupt and ineffective leadership combined to produce the electoral debacle.

Pakistan

1947-60

WAR WITH INDIA. Pakistan achieved independence as a state consisting of 2 regions divided by 1,000 miles of Indian territory. Although both East and West Pakistan adhered to Islam, they differed greatly in geography and climate and in the ethnic and linguistic background of their peoples. The death in 1948 of Mohammed Ali Jinnah, Pakistan's founding father, deprived the new nation of a potent unifying symbol. Pakistan's difficulties were further compounded that year by an undeclared war with India over Kashmir, a state with a predominantly Moslem population and a Hindu ruling class. The Kashmir issue was debated in the UN Security Council, which in 1949 secured a cease-fire and partitioned Kashmir. Pakistan has insisted that India hold a plebiscite permitting the Kashmiris to choose between Indian and Pakistani rule, but India has consistently refused.

PAKISTAN, SEATO, AND CENTO. Pakistan's foreign policy has been motivated primarily by fear of Indian aggression. U.S. offers of weapons in return for Pakistani adherence to the SEATO and CENTO military alliances were therefore well received. Although Washington conceived of both SEATO and CENTO as vehicles for preventing Communist expansion, Pakistan's membership rested primarily not on anti-Communism but on the need for U.S. protection against India.

COUP OF 1958. Party rivalries, cabinet instability, and deterioration of law and order marked Pakistani politics and prompted the army in 1958 to stage a bloodless coup. Field Marshal Moham-

med Ayub Khan became the dominant figure in the new military regime. In an effort to legitimize his government, Ayub in 1959 launched a Basic Democracies plan, providing for the direct election by universal suffrage of 80,000 so-called Basic Democrats who, in turn, would elect Pakistan's president. In 1960 the newly chosen Basic Democrats chose Ayub.

1961-68

DRIFT TOWARD CHINA. Securely in the western camp until 1962, Pakistan then expressed anxiety over large U.S. arms shipments to India in the aftermath of the Sino-Indian border war. Ayub feared these arms would eventually be used against Pakistan. Increasingly skeptical of SEATO's or CENTO's ability to protect her against India, Pakistan sought closer ties with China, most notably through a Sino-Pakistani border agreement signed in 1963. Nevertheless, Pakistan, still dependent on U.S. economic aid, retained membership in the western military pacts, and still outlaws her Communist Party.

GROWTH OF OPPOSITION TO AYUB. For the 1st time in her history, Pakistan in 1965 held direct presidential elections. Ayub was challenged by a coalition of opposition groups whose candidate was Miss Fatimah Jinnah, sister of Pakistan's founder. Ayub won handily, however, and the opposition failed to remain united after the voting. In 1968 rising separatist sentiment in East Pakistan and the growth of opposition sentiment in West Pakistan posed an increasing threat to Ayub's regime.

Ceylon

1948-59

INDEPENDENCE. Ceylon's 1st independent government was headed by Prime Minister Sir John Kotelawala's United National Party. The conservative-oriented UNP, which maintained close ties with the West, remained in power until 1956, its main opposition coming from Ceylon's Marxist groups.

COLOMBO PLAN. A meeting of British Commonwealth Foreign Ministers in Colombo, Ceylon, resulted in the Colombo Plan, a program of regional co-operation in economic aid and technical assistance. The Plan's members include the U.S., Britain, Canada, Australia, New Zealand, and Japan as donors and 17 Asian states as beneficiaries who use the aid for economic development projects.

COLOMBO CONFERENCE. In 1954, representatives from Ceylon, India, Pakistan, Indonesia, and Burma met at Colombo to devise plans to promote economic and political co-operation among themselves and to call for united efforts to preserve world peace. The 5 later sponsored the Bandung Conference, held in Indonesia in 1955. The 5 Colombo Powers, as they were called, gave a major impetus to Afro-Asian co-operation and for a time represented a significant bloc in international affairs.

DEFEAT OF UNP. Having ruled Ceylon since independence, the UNP lost the 1956 elections to the Sri Lanka Freedom Party, led by S. W. R. D. Bandaranaike. The SLFP governed in coalition with a leftist party as the People's United Front until 1959, when conservative SLFP members forced the leftists out of the government.

1960-68

RULE OF BANDARANAIKE. After Prime Minister Bandaranaike's assassination by a Buddhist monk, his widow replaced him in office. Because Mrs. Bandaranaike, the world's 1st woman prime minister, adopted increasingly radical policies, she lost so much support that in 1964 her SLFP was forced to form a coalition government with 3 Communist groups. Her radicalism, reflected at home by confiscation of foreign-owned industries and abroad by the loosening of many western ties in favor of friendship with Communist states, finally generated such opposition from moderates in her party that the government collapsed. The ensuing elections returned the UNP to power under Prime Minister Dudley Senanayake. He advocated a mixed social-

ist economy and a return to closer relations with the West.

LANGUAGE RIOTS. Friction between Ceylon's Sinhalese-speaking majority and Tamil-speaking minority had simmered since independence, but in 1966 a decision to permit use of the Tamil language for government business in Tamil areas led to bloody communal riots. A state of emergency was imposed; but the language issue, together with severe economic difficulties, remain the country's most acute problems.

Indonesia

1949-60

NATIONAL ELECTIONS. Indonesia's 1st national elections, 1955, gave the largest number of votes to the Nationalist Party and Masjumi (a Moslem organization), but the Indonesian Communist Party (PKI) captured 4th place. Since staging an abortive coup in 1948, the PKI had been obliged to moderate its tactics.

BANDUNG CONFERENCE. Indonesia's foreign policy remained neutralist, and the Bandung Conference, 1955, of 29 Afro-Asian nations marked her debut as a leader of the nonaligned world. Sponsored by the Colombo Powers, the conference condemned colonialism and urged international co-operation.

"GUIDED DEMOCRACY" AND REGIONAL REBELLIONS. Weak coalition governments and widespread political factionalism led to disillusionment with parliamentary democracy, which Sukarno called unsuitable for Indonesia. In 1957 he advocated "Guided Democracy," featuring a National Advisory Council with functional representation and an all-party cabinet, including Communists. Meanwhile, centrifugal pressures, always strong in Indonesia, exploded in 1958 in rebellions in Sumatra and Sulawesi directed against the Javanese-dominated central government. The army crushed the uprisings. In 1959 the Constituent Assembly rejected Sukarno's plan for "Guided Democracy," whereupon the president dissolved the Assembly by decree. The following year he suspended Parliament

and replaced it with a "Mutual Cooperation" Parliament with functional representation. Sukarno formally inaugurated the new system in his Political Manifesto of 17 Aug., 1960.

1961-68

"LIBERATION" OF WEST IRIAN. In 1961 Sukarno severed diplomatic relations with the Netherlands for its failure to hand over West Irian, a part of the former Dutch East Indies, to Indonesia. Threatening to seize West Irian by force, Sukarno authorized guerrilla forays into the territory. When war between the Netherlands and Indonesia loomed, the U.S. intervened to mediate the crisis. In 1962 an accord stipulated that West Irian would revert to Indonesian hands on 1 May, 1963, following an interim UN administration.

CONFRONTATION WITH MALAYSIA. Countering western hopes that the acquisition of West Irian would satisfy Indonesia's nationalist ambitions, Sukarno announced, 1963, his intention to crush the new British-sponsored Federation of Malaysia. As in the case of West Irian, much of the impetus for the campaign came from the Communists, who had successfully exploited Sukarno's growing anti-western orientation to increase their influence in Indonesia. During the anti-Malaysia campaign, Sukarno, having alienated his western friends, pursued an increasingly pro-Chinese foreign policy which culminated, 1965, in Indonesia's withdrawal from the UN.

ABORTIVE COMMUNIST COUP OF 1965. On 30 Sept., 1965, the 3 m.-strong PKI, largest Communist Party outside the Communist bloc, staged an abortive coup which was crushed by the troops of Gen. Suharto. The result was a military takeover of Indonesia and a massacre of Communists.

ACCESSION OF SUHARTO. In Mar. 1966, having already been pressured into banning the Communist Party, Sukarno, whose own connection with the coup remained obscure, reluctantly signed over all executive powers to Suharto. In Mar. 1967, the Provisional People's Consultative Congress named Suharto acting

president. Gravitation of political power to the army has been accompanied by concentration on Indonesia's desperate economic problems and abandonment of foreign adventures such as the Malaysian confrontation. Indonesia rejoined the UN, abandoned the Jakarta-Peking axis, and returned to a neutralist foreign policy. Meanwhile, Sukarno, though shorn of all real power, retained considerable popularity, especially in Java.

On 27 Mar., 1968, Suharto was elected president by the Consultative Assembly. Faced with renewed PKI guerrilla activity (stimulated by discontent because of inflation and rice shortages), the government began to concentrate its energies on a new anti-Communist military campaign.

Malaysia

1957-68

SITUATION AT INDEPENDENCE. After independence, 31 Aug., 1957, Malaya remained in the Commonwealth and permitted Britain to maintain military bases in the country. Independent Malaya was a federal state with an elective monarch (chosen by a conference of rulers for a 5-year term). The cabinet was responsible to a bicameral legislature. Malayan independence was a blow for the Communist rebels, who lost hope of exploiting anti-British nationalist feelings.

FEDERATION OF MALAYSIA. Fears that Singapore, with its predominantly Chinese population, would become an outpost of Peking led the British, 1963, to advocate merger between Malaya and Singapore (independent, 1959). Such a merger, however, would have given the Chinese a racial preponderance. The decision was therefore taken to include the British territories of Sarawak and Sabah in Borneo in the new Federation of Malaysia, along with Singapore. Born on 16 Sept., 1963, Malaysia was immediately threatened with extinction by Indonesia. Not until 1966, when a military regime replaced Sukarno, did a treaty end the undeclared war.

WITHDRAWAL OF SINGAPORE FROM THE FEDERATION. After only 2 years of merger, Singapore, for political

and economic reasons as well as personal rivalry between Tengku Abdul Rahman of Malaysia and Lee Kuan Yew of Singapore, seceded from Malaysia, 1965. However, Singapore pledged co-operation with her neighbor in defense and economic matters.

Burma

1947-68

SITUATION AT INDEPENDENCE.

After the proclamation of the Republic of the Union of Burma, 1947, and in return for a generous financial settlement from Britain and a British promise to supply military personnel to train Burma's army, Thakin Nu signed a treaty allowing Britain to use Burmese ports and airfields. Burma's constitution embodied a system of parliamentary democracy, cabinet responsibility to the legislature, and separate states or administrative divisions for Shans, Kachins, Karens, and other minority groups.

COMMUNIST REBELLION. A combination of opposition to the agreement with Britain and adherence to the new militancy advocated by the international Communist movement prompted Burma's Communists to rise in rebellion against the central government, 1948. Sporadic violence among Burma's minority groups further weakened the government.

MILITARY COUP OF 1958. Economic difficulties and minority grievances plagued Burma throughout the decade following independence. In 1958 the AFPFL, which still dominated the country's politics, split into 2 factions, of which that headed by U Nu remained in power. Nu, however, resigned and invited Gen. Ne Win to take over the government and pacify the country. Army rule, characterized by efficiency, honesty, and reduction of Communist and other insurgencies, was followed by free elections in 1960. U Nu's wing of the AFPFL won, but its inefficiency and weakness again imperiled national unity.

COUP BY NE WIN. Finally, Ne Win seized power in a military coup, 1962, which ended parliamentary democracy in

Burma. He preserved the country from fragmentation along ethnic lines, but his vague ideal of "Burmese Socialism" did little to solve pressing economic problems. In foreign policy the military regime maintained strict nonalignment and pursued an increasingly xenophobic policy.

Vietnam, Laos, and Cambodia

1954-68

GENEVA ACCORDS. The Geneva Conference of 1954, attended by the major world powers and the Indochinese states, established a cease-fire and partitioned Vietnam into a Communist nation under Ho in the north and a French-supported state in the south, with elections to reunify the country scheduled for 1956. The Geneva Conference also dealt with the newly independent states of Cambodia and Laos, where Communists harassed the royal governments. The influence of both the Khmer Issarak in Cambodia and the Pathet Lao in Laos was greatly curtailed, and the 2 nations committed themselves to neutral foreign policies.

RISE OF THE VIETCONG. Ngo Dinh Diem, who became South Vietnam's president in 1956, refused to hold national elections as stipulated by the Geneva Conference. Thus, the Communist Vietcong, seeing no hope of Vietnamese reunification while Diem ruled, plotted to overthrow his government. Beginning in 1957, the Communists assassinated large numbers of village and hamlet officials. In 1960 their efforts entered a new phase with the creation in Hanoi of the Front for the Liberation of the South and plans for concerted military action.

CIVIL WAR IN LAOS. Indigenous Communists continued to harass the neutralist government of Laos after the Geneva Conference. A triangular struggle among right-wing military forces, the neutralist government, and the Pathet Lao led to full-fledged civil war, 1961. At a new Geneva Conference, 1962, the world powers imposed a settlement along the

lines of the 1954 accords, but its terms were not regarded as binding by the Pathet Lao.

ASSASSINATION OF DIEM. President Diem's autocratic regime alienated virtually every segment of South Vietnam's population. His overthrow by a military coup and assassination, 2 Nov., 1963, led to a long series of military juntas apparently more preoccupied in squabbling among themselves than in improving the lot of the peasantry or prosecuting the war against the Vietcong.

ESCALATION OF VIETNAM WAR. The U.S., which formerly had supplied arms, financial aid, and military advisers to South Vietnam, gradually assumed a major combatant role. During 1965, large numbers of American troops entered South Vietnam and U.S. planes began bombing North Vietnam (*pp. 591 ff.*).

Philippines

1946-68

U.S.-FILIPINO RELATIONS. Following Filipino independence, 4 July, 1946, the Philippines received tariff concessions on imports into the U.S., but in return had to accept a "parity clause" guaranteeing American businessmen equal rights with Filipinos to exploit the islands' natural resources. This provision generated much bitterness among Filipinos, as did the Military Bases Agreement, signed in 1947, which granted the U.S. a 99-year lease and full legal jurisdiction over several base complexes.

HUKBALAHAP REBELLION. Having led the anti-Japanese resistance in Luzon during World War II, the Communist Party of the Philippines (CPP) deeply resented the government's refusal to allow its leader, Luis Taruc, to occupy the congressional seat he won in postwar elections. President Manuel Roxas also failed to reach an agreement with the Communists to surrender their arms. In 1948 a full-fledged rebellion erupted, led by the Hukbalahaps, the military arm of the CPP. Two years later, Ramon Magsaysay was named defense minister and

placed in charge of anti-Communist operations. Magsaysay intensified military action against the Hukbalahaps, but simultaneously launched a land-reform program to free peasants from the abuses of landlordism. Such measures, coupled with a well-timed police raid on Communist headquarters in Manila, forced the insurgents underground by 1952. Elected president in 1953, Magsaysay continued his agricultural reforms, but they did not survive his death in a plane crash, 1957.

MANILA PACT AND SEATO. Having maintained close links with the U.S. after independence and with the memory of Communist insurgency fresh in mind, the Filipino government welcomed the creation of the Southeast Asia Treaty Organization (SEATO), inaugurated by the Manila Pact, Nov. 1954. Later, left-wing Filipinos advocated renunciation of SEATO and a more independent foreign policy, but Manila continued to support U.S. policy in Asia.

RENEWAL OF COMMUNIST TERRORISM. Although it was outlawed in 1957, the CPP emerged from underground, 1965, to recruit peasant support, denounce the corruption-ridden government, and exploit anti-American sentiment among left-wing students, intellectuals, and others. Hukbalahap terrorists assassinated or threatened many provincial and local officials and big landlords.

CONTROVERSY OVER SABAH. In 1968 the Philippines became embroiled with Malaysia in a war of words over the state of Sabah (formerly North Borneo). The Filipino government claimed the area because Sabah was at one time part of a region the remainder of which is now within the Philippines.

Thailand

1945-68

RULE OF PRIDI. After World War II, Pridi and his colleagues dominated Thai politics. Political instability and widespread corruption and smuggling, however, discredited civilian government. The mysterious death, moreover, of the

young king of Thailand, 1946, raised speculation about Pridi's possible complicity.

MILITARY COUP OF 1947. When P'ibun staged a military coup in 1947, he claimed to have saved Thailand from a Communist and republican take-over. Elections in 1948 gave him a mantle of legitimacy both at home and abroad. In 1949 Pridi, backed by some military men, sought to oust P'ibun's regime and reinstate civilian government. When the coup failed, Pridi fled to China.

THAI ACCESSION TO SEATO. In response to police allegations, 1952, of a Communist plot to overthrow the government, P'ibun authorized the arrest of hundreds of resident Chinese and a ban on Chinese newspapers and schools. The regime also promulgated an Un-Thai Activities Act forbidding Communist activity. Thailand's anti-Communism was reflected in foreign policy by adherence, 1954, to SEATO, which established its headquarters in Bangkok.

EXPERIMENT WITH DEMOCRACY. In 1955 P'ibun suddenly announced that democracy would be permitted in Thailand. This decision was due to a combination of factors: a recent trip by P'ibun to the U.S. and Britain, an attempt to gain popular support, and a softening attitude toward China due to Chou En-lai's warmth at the Bandung Conference.

RETURN TO MILITARY GOVERNMENT. Elections held under the new multiparty system, 1957, gave the government a bare majority, but it was widely accused of ballot rigging. When opposition reached threatening proportions, the government declared a national emergency, which ended political democracy in Thailand. Later that year, Gen. Sarit Thanarat staged a bloodless coup, dissolved the legislature, and suspended the constitution. An army-led coalition government was formed, but in 1958 Sarit staged another coup and assumed power at the head of a military junta. His regime renewed suppression of the Communists and other opposition groups.

U.S. GUARANTEE TO THAILAND. Disturbed by Communist successes in the

Laotian civil war across Thailand's frontier, Thai Foreign Minister Thanat Khoman signed a joint statement with U.S. Secretary of State Dean Rusk, 6 Mar., 1962, guaranteeing Thailand's security and territorial integrity and pledging U.S. protection of the country from armed attack or "indirect aggression." Two months later, as the Laotian situation deteriorated further, the U.S. landed a marine contingent in Thailand.

COMMUNIST INSURGENCY. As the Vietnam War intensified, the U.S. made increasing use of its military bases in Thailand, while the Thais sent troops to South Vietnam. Such actions angered Peking, which in 1965 announced creation of a Thai Patriotic Front dedicated to the overthrow of the Bangkok regime and elimination of U.S. influence from Thailand. The Communist threat became particularly strong in the northeast, Thailand's most underdeveloped area, whose residents are ethnically similar to the Lao peoples across the Mekong River. In 1967 the military took over complete control of the anti-Communist campaign in the northern provinces, and martial law was declared, 1 Dec., in 5 central and southern provinces.

AUSTRALASIA

Australia

1945-68

POSTWAR POLICIES. On 5 July, 1945, Joseph B. Chifley replaced John Curtin as prime minister. Labour remained in office until 1949, running the country according to principles far different from those employed by prewar governments. The almost immediate achievement of full employment resulted from a sharp increase in consumer demand and not from a healthy balance among various types of industries or from an adequate supply of basic services supporting production growth. As a reaction against having been attacked, Australia was now determined to sustain her position by rapidly increasing her economic strength and by building up her population by encouraging the

flow of immigrants from Europe. Though aware of changes in Europe, the Australian government was much more concerned with her neighbors to the north and Labour's general reaction was to view the rising anticolonialism of the new Asian nations in terms of nationalism rather than Communism, even at the risk of alienating the former colonial powers.

LABOUR PARTY-COMMUNIST CLASH. The Australian Communist Party, having followed a prowar policy, had won control of several important unions, though its numbers remained small. These unions antagonized the Labour government by employing the strike weapon to settle disputes rather than by using the available arbitration machinery. The Communist-inspired strike in the New South Wales coal mines, 1949, brought swift government retaliation. Public reaction to the economic chaos caused by the coal strike and also to Chifley's unsuccessful attempt to nationalize the banks resulted in a victory for the Liberal-Country Party coalition in the 1949 general election.

THE MENZIES ERA. Under Robert G. Menzies (prime minister, 1949-66), Australia entered a new era. To promote economic growth Menzies did not hesitate to borrow abroad. Although in the 1950's there were 3 periods of inflation and 3 of recession, the general trend of the national income was upward. Employment, especially in the steadily growing industrial sector, remained full, and Menzies remained in office. He dealt with the 2 important issues which had defeated Labour by satisfactorily regularizing relations between the Commonwealth Bank and the private trading banks, and by proposing to proscribe the Communist Party. Fearing gross infractions of the civil liberties of all citizens as a consequence of an attempt to silence one group, Labour successfully fought the proscription attempt, but anti-Communism was not thereby abated or the Communist cause noticeably advanced. Though accused of favoring the Communists and badly split when a large Roman Catholic element set up a splinter Democratic Labour Party, Labour candidates

gained 15 more seats in the House in the 1961 elections, reducing the Liberal-CP majority to 2.

FOREIGN AFFAIRS. For Menzies Australia's relations with Britain were of primary importance, and next to them her relations with the U.S. But as the postwar world changed, the Australian government's foreign policy changed likewise to meet new demands. The Commonwealth had to sustain its own position, especially in regard to the U.S. and Asia, and with less dependence on Britain than before the war. Thus Australia refused to recognize mainland China (though Britain did so), was the first UN member to join the U.S. in the Korean War, and sent troops to Vietnam.

On 20 Jan., 1966, Menzies retired and was succeeded as prime minister first by Harold E. Holt (1908-67) and then by John H. Gorton (b. 1911). There has been little change in the government's internal or external policies.

New Zealand

1945-68

INDUSTRIAL RELATIONS. In Feb. 1945 the government substantially altered New Zealand's 3-year-old wage stabilization plan by allowing labor unions dissatisfied with existing wages and scales to apply to arbitration courts for review.

LABOUR VICTORY OF 1946. On 27 Nov., 1946, the Labour government was re-elected, winning 42 parliamentary seats to the National Party's 38.

ECONOMIC POLICY. In Sept. 1947 New Zealand extended butter and meat rationing into 1948 to permit maximum exports to Britain. In Aug. 1948 New Zealand restored currency parity with Britain. In Sept. meat rationing was abolished, with only butter and gasoline remaining. (Butter rationing ended on 4 June, 1950.) New Zealand had record trade totals for the year ending 30 June, 1948. In Sept. 1949 the New Zealand pound was devalued from U.S. \$4.03 to \$2.80.

NATIONAL PARTY REGIME. In elections held 30 Nov., 1949, Labour (in

power 14 years) lost control of Parliament when the National Party won 46 seats to Labour's 34. On 13 Dec. Sidney George Holland (1893-1961), leader of the National Party, became prime minister. In June 1950 Holland announced that the Legislative Council, the upper house of Parliament, would vote itself out of existence after he appointed enough new members to give his National Party a Council majority. Elections in Sept. 1951 increased the National Party's strength—50 seats to Labour's 30. In the Nov. 1954 parliamentary elections, the National Party won 43 seats to Labour's 37. On 20 Sept., 1957, Holland resigned as prime minister because of poor health and was succeeded by Deputy Prime Minister-Agriculture Minister Keith Jacka Holyoake (b. 1904).

LABOUR VICTORY OF 1957. In Nov. 1957, Labour won the general elections, and Walter Nash (1882-1968) was

sworn in as prime minister, 12 Dec. In Jan. 1958 Nash imposed licensing controls on all imports because New Zealand's foreign-payment deficit had increased from \$11.2 million in Sept. 1956 to \$84 million in Sept. 1957. In Sept. 1959, the government announced a \$114-million trade surplus for the year ended 30 June, due to heavy U.S. purchases of beef and wool.

ACCESSION OF HOLYOAKE. In Nov. 1960, Nash's Labour Party was defeated by the National Party led by ex-Prime Minister Holyoake. The National Party won 45 seats to Labour's 35. On 1 Dec., 1963, Holyoake's National Party won another 3-year term, and in 1966 Holyoake won his 3rd 3-year term, indicating public endorsement of his policy of sending combat troops to Vietnam. In 1967, the New Zealand currency was devalued by nearly 20% in response to British devaluation.

Patterns of Regional Organization

THE MOVEMENT FOR EUROPEAN UNITY

1946-54

EARLY PROPOSALS. European union had been discussed among European resistance leaders during the war and by the governments in exile in London. Speaking in Zurich, 19 Sept., 1946, Churchill called for a United States of Europe, with Britain as a sponsor rather than a member. European socialists, especially Paul Henri Spaak (b. 1899), supported closer union, but British socialists were unenthusiastic. In June 1946 Churchill launched the United Europe Movement.

CONGRESS OF EUROPE. In Dec. 1947, most of the movements for European unity formed the International Committee of the Movements for European Unity; among these were Churchill's United Europe Movement, the European Union League led by Paul van Zeeland (b. 1893), the European Union of Federalists led by Henri Brugmans (b. 1906),

the Nouvelles Équipes Internationales of Robert Bichet (b. 1903), the Socialist Movement for a United States of Europe of Bob Edwards (b. 1906), and the European Parliamentary Union founded on the initiative of the veteran proponent of European unity, Count Coudenhove-Kalergi (b. 1894). The committee convened a "Congress of Europe" at The Hague, 7-10 May, 1948, with 713 participants from 16 countries, including Churchill, de Gasperi, Spaak, and Robert Schuman. It called for an economic and political union of Europe and the creation of a consultative assembly of European parliamentarians and a European Court of Human Rights. These proposals were studied by the Brussels Treaty Permanent Council, while the U.S.A. announced its support for European union.

COUNCIL OF EUROPE. Belgium and France proposed a parliamentary assembly, but Britain rejected this, proposing instead an intergovernmental council of ministers. Meanwhile, the International

Committee formed the European Movement, 25 Oct., as a permanent unofficial group to promote European unity. The British reluctantly agreed to the idea of an Assembly. On 5 May, 1949, the statute creating the Council of Europe was signed by 10 powers in London; it set up a parliamentary Consultative Assembly and a Committee of Ministers meeting in Strasbourg. The Consultative Assembly, whose 1st president was Spaak, attempted at once to strengthen the supranational nature of the Council, but British and Scandinavian members opposed such moves. A European Convention on Human Rights was signed, 4 Nov., 1950, creating a Court and a Commission, and granting the right of individual recourse.

MARSHALL PLAN. On 5 June, 1947, Gen. George C. Marshall, in a speech at Harvard, invited European countries to draw up a recovery program, promising American aid in implementing it. Bevin, Molotov, and Bidault met to discuss the offer 27 June–3 July, but could not agree. Molotov rejecting a collective approach. Britain and France invited other European states to meet to prepare a joint program; 14 non-Communist states attended the Paris Conference, July. The Conference set up a Committee on European Cooperation to construct a joint 4-year program of needs, resources, and requirements; this report was adopted, 22 Sept., and sent to Washington. On 15 Jan., 1948, Britain and France proposed creating a permanent organization to harmonize action; on 16 Apr., 16 countries participating in the European Recovery Program signed the Convention creating the Organization for European Economic Cooperation (OEEC). From 1948 to 1952 OEEC distributed \$12 billion of American aid.

EUROPEAN COAL AND STEEL COMMUNITY. On 9 May, 1950, French Foreign Minister Robert Schuman made public a detailed proposal worked out by Jean Monnet (b. 1888) for placing French and German coal and steel under a High Authority which would have directly binding powers, the agreement to be open to other European states. Benelux (the economic union of Belgium, the

Netherlands, and Luxembourg, formed 29 Oct., 1947), Italy, and Germany welcomed the plan; the British stood aloof. Within continental Europe, only the Gaullists, Communists, and German Socialists opposed the idea. In the ensuing negotiations among the 6 countries, a Council of Ministers to represent the states was added to the plan. The Treaty of Paris creating the European Coal and Steel Community (ECSC) was signed, 18 Apr., 1951. The High Authority of 9, appointed by but not responsible to the member states, took office under Jean Monnet as president, 10 Aug., 1952; a Common Assembly of 78 parliamentarians designated by each Parliament was empowered to discuss the work of the Community; a Court of Justice adjudicated treaty disputes; and a Consultative Economic and Social Committee advised the Authority. By May 1953 the Common Market in coal and steel was effective.

EUROPEAN DEFENSE COMMUNITY. With the outbreak of the Korean War, the U.S. sought the raising of 12 German divisions. On 11 Aug., 1950, Churchill proposed the creation of a European army; Reynaud, Adenauer, and Schuman supported it. Pressure grew, especially after the adoption, Sept., of a "forward" strategy by NATO. In an effort to prevent the creation of an autonomous German army, René Pleven (b. 1901) proposed, 24 Oct., the creation of a European Defense Community (EDC), on the lines of the ECSC. Benelux, Italy, and Germany accepted. Negotiations led to the signature of the Treaty of Paris instituting EDC, 27 May, 1952; it provided for organs similar to those of ECSC and for the integration of the 6 armies.

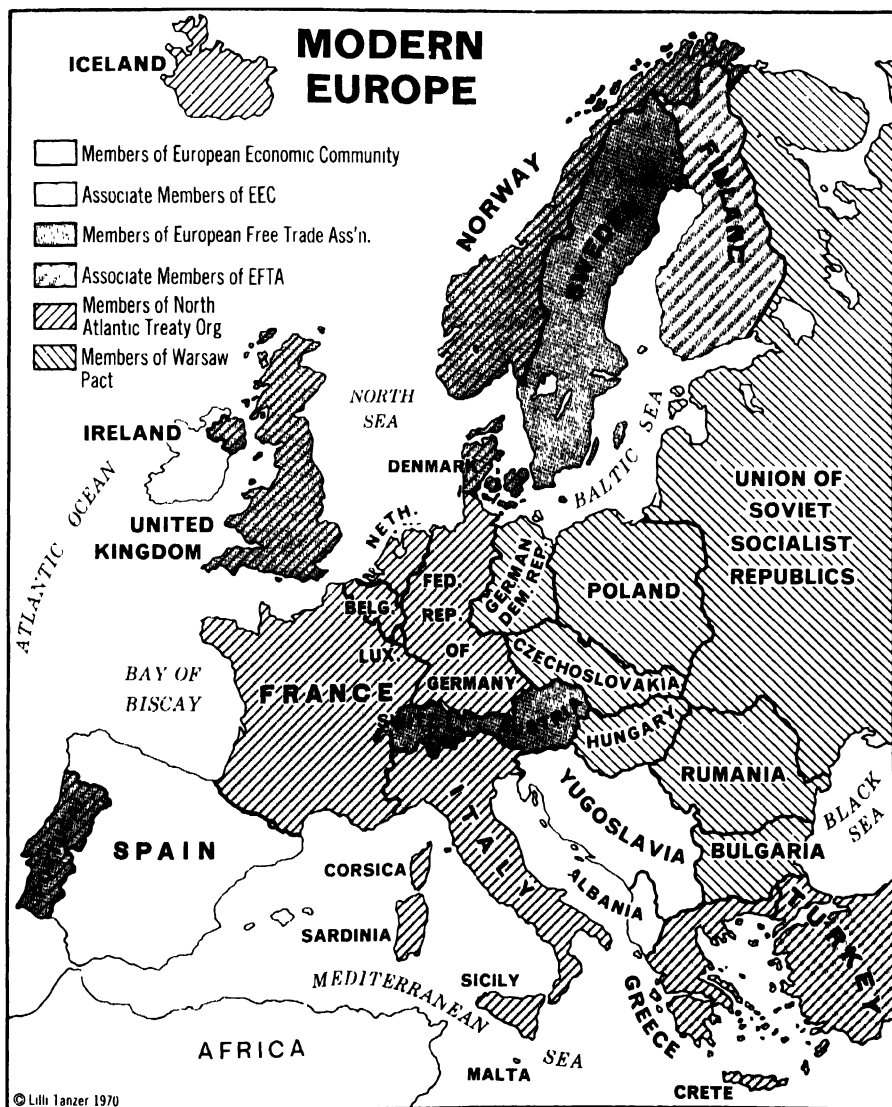

EUROPEAN POLITICAL COMMUNITY. On 30 May, 1952, the Common Assembly asked the governments of the 6 to prepare the draft of a European Political Community as foreseen in the EDC Treaty. The 6 foreign ministers invited the Common Assembly to draft such a treaty, 10 Sept.; adding representatives of other member states of the Council of Europe, it formed an Ad Hoc Assembly, presided over by Spaak, which presented its draft for a "European Community," 10

Mar., 1953; it proposed a People's Chamber, directly elected, and a Senate representing the states, an Executive Council responsible for general administration, a Council of national ministers to harmonize national and European policies, a Court of Justice, and an advisory Economic and Social Council. The proposed community would absorb the functions of EDC and ECSC. The other 5 ratified EDC, but when it was put to the French National Assembly, it was rejected on a

technicality, 30 Aug., 1954. Both EDC and EPC therefore died.

1954-68

WESTERN EUROPEAN UNION. Following the French Assembly's action, Eden at once called a conference in London of the 6, Britain, the U.S.A., and Canada, 28 Sept.-3 Oct. Britain declared her willingness to maintain British troops on the Continent. The Conference re-

sumed in Paris, 20-23 Oct., and resulted in the Paris Agreements. These restored German sovereignty; allowed controlled rearmament of Germany; admitted Italy and Germany to a revised Brussels Treaty (renamed Western European Union); prohibited Germany from manufacturing atomic, bacteriological, or chemical weapons; and established a European Statute for the Saar. (The Statute was rejected by the Saar voters, 23 Oct., 1955, and the Saar was incorporated in Germany, 1 Jan., 1957.)

EUROPEAN ECONOMIC COMMUNITY. In May 1955 the Common Assembly called on the 6 to proceed with economic union. The foreign ministers met at Messina, 1-2 June, and endorsed the idea of economic integration and an atomic energy community. An intergovernmental committee (Spaak Committee) was formed and reported in Apr. 1956. Pressure was also brought to bear by the Action Committee for the United States of Europe, founded by Monnet, 18 Jan., 1956. The ministers approved the report and the Spaak Committee prepared a draft treaty. The resultant Treaty of Rome was signed, 25 Mar., 1957, and entered into force, 1 Jan., 1958. It provided for a European Economic Community (EEC); for the gradual elimination over 12 to 15 years of all tariffs among the Six, and the introduction of a common external tariff; for the making of common agricultural, social, trade cycle, transport, and energy policies; and for the free movement of labor, capital, and services. It created a Council of Ministers, an independent Commission of 9, and an enlarged Common Assembly of 142 with powers of discussion. The ECSC Court of Justice became that of the EEC. A European Development Bank to aid underdeveloped areas of the EEC and a European Investment Bank to assist the associated territories of the EEC (colonies of France, Belgium, and the Netherlands) were established. A separate treaty set up the European Atomic Energy Community (Euratom). Walter Hallstein (b. 1901) was named president of the EEC Commission and Louis Armand (b. 1905)

president of the Euratom Commission. Both organizations settled in Brussels.

EUROPEAN FREE TRADE ASSOCIATION. In July 1956 Macmillan proposed to the OEEC that it investigate the creation of an industrial free trade area. A working group reported its feasibility, Jan. 1957. In Sept. negotiations began among the OEEC members in a committee chaired by Reginald Maudling (b. 1916). The French were cool to the proposal, and in Nov. 1958 they declared it impracticable, thus ending the negotiations. The British canvassed the idea of a free trade area without the 6, and 7 states (Austria, Britain, Denmark, Norway, Portugal, Sweden, and Switzerland) signed the Convention of Stockholm, 20 Nov., 1959, creating the European Free Trade Association; a progressive reduction of industrial tariffs among the members was to be instituted. The organization was based in Geneva; the 1st 20% tariff reductions were made on 1 July, 1960.

BRITISH ATTEMPT TO JOIN EEC. The 1st EEC tariff reductions were made on 1 Jan., 1959. By July 1960 duties had been reduced to 80% of their 1958 level, and a decision was made to speed up further cuts and also the institution of a Common External Tariff. On 10-11 Feb., 1961, after a series of bilateral meetings, the heads of government of the 6 met in Paris to discuss political union. They set up a commission headed by Christian Fouchet (b. 1911) to outline proposals. At a 2nd meeting in Bonn, 18 July, they instructed the Fouchet Committee to draw up a formal draft. On 31 July, Macmillan announced that Britain would open negotiations with a view to joining EEC. Denmark and Ireland did likewise, Aug. The British negotiations opened on 10 Oct., Edward Heath leading the British team. The Fouchet Committee presented its plan, Nov., proposing a Union of European States, with frequent regular meetings of heads of government and foreign ministers, acting unanimously; other states might be admitted by unanimous decision. In Dec. the European Parliamentary Assembly

called for the inclusion in the plan of a secretary general with powers of initiative and direct elections to the Assembly. After prolonged discussions, the 6 agreed, 14 Jan., 1962, on the broad lines of a common agricultural policy and passage to the 2nd stage of the treaty. Discussions on political union continued, but on 17 Apr., following a British request in the Western European Union Council to take part in them, Belgium and Holland refused to accept a revised French draft plan, and declined further discussions without British participation, which the French in turn rejected. The British negotiations continued, the British insisting on safeguards for their agriculture, Commonwealth trade, and their EFTA partners. De Gaulle made a state visit to Germany, 4-9 Sept. In a press conference, 14 Jan., 1963, de Gaulle stated that he did not deem Britain ready to join the EEC; the negotiations were adjourned, *sine die*, 29 Jan.

DEVELOPMENT OF EEC. On 22 Jan., 1963, de Gaulle and Adenauer signed a Franco-German Treaty of Co-operation, providing for semi-annual meetings of heads of government and more frequent meetings of other ministers. The Bundestag attached a preamble to it on ratification, reiterating Germany's commitment to NATO and belief in British membership in the EEC. On 20 July the 6 signed the Convention of Yaounde with 18 associated states of the EEC, to run to 1969. In Sept., Nigeria asked for association negotiations; the association agreement with Turkey was signed, 12 Sept. On 24 Sept., Tanganyika, Uganda, and Kenya requested negotiations, on 18 Oct. Tunisia, and on 14 Dec. Morocco. On 23 Dec. the Council agreed on basic regulations for certain agricultural products. On 5 Feb., 1964, negotiations opened with Algeria. In a decision, 15 July, the Court of Justice recognized the primacy of Community law over national law. In Sept., the Commission proposed "Initiative 64" to speed up the customs union and remove other trade barriers. On 15 Dec., the Council finally agreed on common cereal prices, the

heart of the agricultural policy, to be effective 1 July, 1967. On 19 Mar., 1965, negotiations on membership began with Austria. On 8 Apr., a treaty was signed for the merger of the executives of the ECSC, EEC, and Euratom. On 30 June, following disagreement on the financing of the agricultural policy, the French decided to boycott Community activities. The crisis was resolved, 28-29 Jan., 1966, when France agreed to resume participation after agreement to disagree on the question of majority voting. On 16 July the association agreement with Nigeria was signed. On 8 Feb., 1967, the Council adopted the 1st medium-range economic program. British Prime Minister Harold Wilson made a new bid to join EEC, 11 May. On 17 May de Gaulle virtually ruled out the possibility of British membership in the foreseeable future.

WESTERN HEMISPHERE CO-OPERATION

1945-68

REGIONAL ORGANIZATION BEFORE WORLD WAR II. "Pan-Americanism," a term much in use before World War II, referred specifically to regional organization which included both the U.S. and Latin America (as distinct from a "Latin Americanism" which concerned Latin nations exclusively). The history of Pan-Americanism dates from the 1st International Conference of American States, 2 Oct., 1889-19 Apr., 1890, which instituted a "Commercial Bureau," renamed the "Pan American Union" in 1910. This limited machinery for diplomatic and economic co-operation could serve no multilateral function, confronted by the overwhelming preponderance of power asserted by the U.S., especially in the Caribbean, 1890-1930. The system was powerless to stop several intraregional conflicts in the interwar period, notably the bloody Paraguay-Bolivia Chaco War, 1932-35. In the early 1920's Latin nations tried, unsuccessfully, to use the League of Nations as an institutional counterweight to the regional

organization, which, by the time of the Havana Conference, 1928, they were openly denouncing 'as a State Department puppet.

U.S. GOOD NEIGHBOR POLICY.

Franklin Roosevelt rejuvenated the North-South relationship, ending unilateral U.S. intervention (Montevideo Conference, Dec. 1933), laying foundations for economic co-operation (e.g., Export-Import Bank, 1934), and involving Latin nations in hemispheric defense during World War II (Havana Conference, 1940).

PAN AMERICAN CONFERENCES.

Following World War II the range of U.S.-Latin American co-operation broadened, with the periodic grandiose Pan American conferences (the last held in Caracas, 1954) gradually replaced by more frequent and specialized contacts, diplomatic, cultural, military, and economic. Nevertheless, inter-American regional organization remained weak, providing neither the collective security desired by the U.S. nor the economic development wanted by Latin America.

ORGANIZATION OF AMERICAN STATES. U.S. involvement in World War II and the Cold War ended whatever basis the old Pan-Americanism possessed—a common New World isolationism from Europe. The U.S. inevitably saw Latin America as one part of its worldwide commitment. It conceived of regional organization primarily in terms of collective security, with the Rio Pact for mutual defense (2 Sept., 1947) and the Organization of American States (OAS, created Mar. 1948) as its instruments. Latin American nations, the long fight for the principle of nonintervention fresh in their memories, resisted this initiative. They remained largely unresponsive to U.S. appeals for OAS action on Korea, Mar. 1951, Guatemala, Mar. 1954, and Cuba, 1960 onward. In 1965 the U.S. demonstrated its lack of confidence in multilateral military action when it unilaterally invaded the Dominican Republic, 28 Apr., in direct violation of the OAS Charter, only afterward requesting creation of an OAS peace force, which came into existence, 6 May.

ECONOMIC CO-OPERATION.

Through the 1950's Latin nations worried less about an external threat from Communism than an internal one from pressing social and economic problems. The violent Latin response to the good-will tour of Vice-President Richard Nixon, 27 Apr.–15 May, 1958; the proposal of "Operation Pan America" by Brazilian President Juscelino Kubitschek, June 1958; and the victory of Fidel Castro in Cuba, 1 Jan. 1959, finally spurred the U.S. to a new kind of regional co-operation. On 29 Dec., 1959, it supported establishment of an Inter-American Development Bank, with \$1 billion capitalization. By the Act of Bogotá, 12 Sept., 1960, the U.S. endorsed Latin American social reform and statist economic planning.

ALLIANCE FOR PROGRESS. Proposed, 13 Mar., 1961, by President John F. Kennedy, and chartered at Punta del Este, Uruguay, 17 Aug., 1961, the Alliance for Progress committed the nations of the Americas to a \$100 billion 10-year program of tax and land reform and a projected 2.5% annual economic growth. Of the \$100 billion, the U.S. pledged \$20 billion, with \$11 billion of this from government funds at low interest. The results have not been encouraging. Few Latin governments have had either the technical expertise to implement national economic planning or a real commitment to social reforms. For its part, the U.S. has appeared less concerned with social justice than social stability. Despite the creation of an Inter-American Committee for the Alliance, Jan. 1964, the *Alianza* has remained essentially a foreign aid program, based on bilateral bargaining between individual Latin nations and the U.S.

LATIN AMERICANISM. Although efforts were made in the 19th cent., there was no significant intra-Latin American co-operation until the 1960's. Then it was not so much cultural similarities that brought Latin nations together as a common economic dilemma. Through the 1950's the UN's Economic Commission for Latin America (ECLA, headed, 1950–63, by the Argentine, Raúl Prebisch) made them aware of their deteriorating

position vis-à-vis the advanced manufacturing nations. Latin America's terms of trade declined by 21% between 1950 and 1962. What was desirable for the developed countries was not necessarily beneficial to them: stripped of protection under the tariff reductions approved by GATT (General Agreement on Tariffs and Trade), intraregional Latin trade dropped from 12.1% of total exports in 1955 to 7.1% in 1961. With the example of the thriving European Economic Community before them, Latin America turned to economic integration.

CENTRAL AMERICAN COMMON MARKET. In the century and a half following independence from Mexico, 1823, 25 unsuccessful formal efforts were made to reintegrate the Central American countries politically. In Dec. 1960, turning to economic co-operation, Guatemala, El Salvador, Nicaragua, and Honduras (joined by Costa Rica, July 1962) signed at Managua, Nicaragua, a General Treaty establishing a customs union. With the elimination of tariff barriers between one another (on 85% of tariff items by mid-1965), intraregional trade rose from \$32.7 m. in 1960 to \$136.0 m. in 1965. The creation of a common external tariff was 70% complete (by value) by 1966. Some progress had been made on integrated economic planning.

LATIN AMERICAN FREE TRADE AREA. The Treaty of Montevideo (ratified 2 May, 1961) created a free trade area (LAFTA) between Argentina, Brazil, Chile, Mexico, Paraguay, Peru, Uruguay, Colombia (30 Sept., 1961), and Ecuador (3 Nov., 1961), determined "to establish, gradually and progressively, a Latin American common market." This broader commitment was strengthened by the Latin nations at Punta del Este, Apr. 1967, and there endorsed by the U.S., which, although not directly included, stood to gain greatly from expanded markets for U.S.-owned subsidiaries. The gradual elimination by 8% per year of internal tariffs raised intra-LAFTA trade from \$299 m. in 1961 to \$588 m. in 1964, but Argentina alone reaped almost half this gain. By 1967 LAFTA had achieved neither a common external tariff nor sig-

nificant economic complementarity and integration. An "Andean Group" (Colombia, Chile, Venezuela, Peru, and Ecuador) was created by the Declaration of Bogotá, 16 Aug., 1966, to counterbalance the economic weight of the 3 largest Latin countries, Brazil, Mexico, and Argentina.

PAN-ARABISM

1945-68

NATURE OF PAN-ARABISM. Pan-Arabism, although it had its roots in the 19th and early 20th cents., is, in political terms, largely a creation of the years since 1945. What began primarily as a cultural movement in the mid 19th cent. and received further stimulus from the Pan-Turkic policy of the Ottoman Empire after the Young Turks' revolution of 1908, emerged as a more recognizably political movement in the mid-1930's mainly as a result of the Palestine Question. The basic components of Pan-Arabism had long been present: a common language and culture as well as a glorious past, the memory of which still produces a strong emotional response. In its early stages, however, Pan-Arabism remained little more than a vague attachment to a culture and language and lacked a concrete program. The first objective of Pan-Arabism was freedom from foreign control, and it was not until the Arabs had attained independence from Ottoman and European overlordship that there could be any real attempt to make Pan-Arabism a meaningful basis for unity within the Arab world.

FORMATION OF THE ARAB LEAGUE. The attempts to make Pan-Arabism a reality have taken several different forms. The earliest and most long-lived of these was the creation of the Arab League, 22 Mar., 1945. Composed originally of 7 states, it has grown to include 13 Arab countries of the Middle East and North Africa. It was envisaged as an organization through which the members could co-ordinate their political activities and make decisions on Arab affairs. The power of the League was

limited from the beginning, however, by the proviso that its decisions were only binding on those members who accepted them. The success of the Arab League as an instrument of Pan-Arabism has been confined largely to the nonpolitical sphere. During the Palestine war of 1948 there was dissension in its ranks because of the determination of Jordan to annex parts of what had been Palestine, and the Arab military effort against Israel met with defeat. The armies of the various Arab states participating in the war were unable to co-operate effectively.

ARAB LEAGUE POLICIES. On the positive side the Arab League adopted a cultural treaty, 27 Nov., 1945, providing for exchanges of professors and students and for translations of texts and co-operation between scientists and writers of member countries. In 1950 a joint defense and economic co-operation treaty was signed, and in 1954 an Arab postal union was set up. Jan. 1959 saw the creation of an Arab Development Bank and further economic ties were established, Jan. 1965, with the creation of an Arab common market. The Arab League has also held conferences on common problems such as the division of the Jordan waters. There have, however, been continuous quarrels among its members, leading in some cases to temporary withdrawals from the League, such as those of Iraq and Egypt.

LEADERSHIP OF NASSER. With the emergence of Gamal Abdel Nasser in Egypt after the revolution of 1952, Pan-Arabism found its most powerful exponent. As the spokesman of the Pan-Arab ideal, Nasser had no rival. His personal charisma, coupled with his notable success in dealing with the West, made him the natural leader of the Pan-Arab movement, but even he was unable to preserve for long the ephemeral unions created with Syria in 1958 and with Syria and Iraq in 1963. The United Arab Republic, created by the merger of Syria and Egypt, lasted only until 1961, when Syria withdrew, having disliked the imposition of Nasser's economic policies, which were ill-suited to the Syrian economy, and resenting the almost totally Egyptian personnel

and orientation of the regime. In the case of the UAR, practical considerations proved too powerful for Pan-Arab feeling to overcome. The union of the monarchies of Iraq and Jordan, which occurred almost immediately after the formation of the UAR in Feb. 1958, was also short-lived and vanished in the Iraqi revolution of July 1958.

INFLUENCE OF THE BA'ATH PARTY. The projected union of Egypt, Syria, and Iraq, 1963, brought into play the conflict between Nasser and the Ba'ath Party, a socialist organization founded in 1940 and having branches in several Arab countries. At the moment of union, Apr. 1963, the Ba'ath was in power in Syria and Iraq and on good terms with Nasser, and it seemed that the union might have some chance of success. This situation did not last, however, and the union was never implemented. In addition conflict within the Ba'ath organization itself, both in Syria and Iraq, weakened the party's position as a potential basis for Pan-Arab unity. Ba'ath theoreticians have attempted to formulate an ideology for the Pan-Arab movement, but the party has not been able to attain and hold onto political leadership.

PAN-AFRICANISM

1945-58

PAN-AFRICAN CONGRESSES BEFORE WORLD WAR II. The idea of pan-Africanism had its origins in the Western Hemisphere, among black men living in the United States and the West Indies. The 1st Pan-African Congress was convened in London, 1900, by H. Sylvester Williams, a lawyer from Trinidad. About 30 delegates from Britain, the West Indies, and North America met together to express their solidarity as black men in the face of white oppression in America and Africa. They addressed a protest to Queen Victoria about British expansion into African land in Central Africa. It was at this congress that the American intellectual, W. E. B. Du Bois, made his well-known prediction: "The

problem of the twentieth century is the problem of the color line."

The 2nd Pan-African Congress met in Paris, 1919, during the Peace Conference. Fifty-seven representatives from the U.S., the West Indies, and various African colonies came together under Du Bois' leadership. This congress adopted resolutions calling for laws to prevent exploitation of Africans and asserting the right of Africans to participate in the government of their own countries.

In 1921, Du Bois presided over the 3rd Pan-African Congress, which met in 3 sessions in London, Brussels, and Paris. The delegates now numbered 113, but the majority were still from America and Europe. The conference called for increased local self-government in colonies and recognition of the equality of all races. These demands were reiterated at the 4th Pan-African Congress in London and Lisbon, 1923. A 5th Congress met in 1927 in New York; it was the last meeting led directly by Du Bois.

PAN-AFRICAN FEDERATION. During World War II, Britain became the center of pan-Africanism. In 1944, several organizations joined to form the Pan-African Federation, whose leaders included the West Indians George Padmore and C. L. R. James and the African Jomo Kenyatta. In 1945, the Federation sponsored the 6th Pan African Congress in Manchester. Although influential Americans and West Indians were present, this congress was predominantly African. Among its members were such future leaders as Kwame Nkrumah, Chief S. L. Akintola, Jomo Kenyatta, and Wallace Johnson. The resolutions of the Manchester Congress reflected the change in the pan-African movement; the delegates demanded independence for Africa within the world community, and they pledged to use force, as a last resort if necessary, to achieve African freedom.

1958

1ST CONFERENCE OF INDEPENDENT AFRICAN STATES. The 1st pan-African meeting on African soil included

all 8 independent African states: Ghana, Liberia, Ethiopia, Sudan, Egypt, Tunisia, Libya, and Morocco. The delegates met at Accra, Ghana, 15-22 Apr., 1958, and declared their opposition to colonialism and their support for Algeria's fight for independence. They adopted a policy of nonalignment and loyalty to UN decisions in foreign affairs, and they agreed to recognize each other's sovereignty and settle differences among themselves by negotiation.

PAN-AFRICAN FREEDOM MOVEMENT FOR EAST AND CENTRAL AFRICA. Political parties in Tanganyika, Kenya, Uganda, Northern and Southern Rhodesia, Nyasaland, and Zanzibar met at Mwanza, Tanganyika, Sept. 1958, to form a loose grouping which aimed to promote continental unity by consolidating regional associations. In 1962, PAFMECA became PAFMECSA with the addition of countries of Southern Africa. The organization became increasingly concerned with assisting liberation movements.

1ST ALL-AFRICAN PEOPLES ORGANIZATION CONFERENCE. The AAPO was a group not of governments but of political parties. The first conference, held in Accra, Ghana, 5-13 Dec., 1958, declared its ultimate objective to be "the evolution of a Commonwealth of Free African States." This aim was strongly supported by Ghana's President Nkrumah, who called for the "total liberation of Africa."

1959-68

CONAKRY DECLARATION. On 1 May, 1959, at Conakry, Guinea, Ghana and Guinea declared the creation of the Ghana-Guinea Union, which was to be the beginning of a Union of Independent African States. In Dec. 1960, Mali joined to form the Ghana-Guinea-Mali Union.

SANNIQUELLIE DECLARATION. In reaction to the Conakry Declaration, Liberia's President Tubman called a meeting with Nkrumah and Touré at the Liberian village of Sanniquellie. On 19 July, 1959, they issued a statement setting

forth the principles which should underlie a Community of Independent African States. In such a community, each state would maintain its own national identity.

2ND CONFERENCE OF INDEPENDENT AFRICAN STATES. The conference met at Addis Ababa, Ethiopia, 15-24 June, 1960, with delegates from 13 countries: Algeria Provisional Government, Cameroon, Ethiopia, Ghana, Guinea, Libya, Liberia, Morocco, Nigeria, Somalia, Sudan, Tunisia, United Arab Republic. The discussion at this meeting revealed the continuing difference of opinion between those who would impose African unity immediately from above and those who would allow unity to evolve gradually out of federations of sovereign states.

BRAZZAVILLE DECLARATION. Brazzaville, Republic of Congo, was the site of a meeting of delegates from 12 former French territories: Cameroon, Central African Republic, Chad, Republic of Congo, Dahomey, Gabon, Ivory Coast, Malagasy Republic, Mauritania, Niger, Senegal, Upper Volta. In addition to discussing several current political questions, they declared, 19 Dec., 1960, their desire for progress in inter-African co-operation, but they opposed complete political integration.

CASABLANCA CONFERENCE. Algeria, Ghana, Guinea, Libya, Mali, Morocco, and the United Arab Republic met at Casablanca, Morocco, 3-7 Jan., 1961, to express their opposition to the Brazzaville group's position on the Congo and Mauritania. But on the question of African unity, although Nkrumah argued for political union, the majority of the Casablanca powers were willing to commit themselves only to efforts for "an effective form of co-operation."

MONROVIA CONFERENCE. This conference met at Monrovia, Liberia, 8-12 May, 1961, in an attempt to reconcile differences among the various groups. In addition to the 12 Brazzaville states, Liberia, Nigeria, Somalia, Sierra Leone, Togo, Ethiopia, and Libya sent representatives. But the absence of most of the Casablanca group weakened the force of

the Monrovia declaration on principles of unity.

LAGOS CONFERENCE. From 25-30 Jan., 1962, the Monrovia group met again in Lagos, Nigeria, with the addition of Congo (Léopoldville) and Tanganyika but without Libya, which stayed away along with the other Casablanca states. Although this conference also failed to bring together all African states, it ratified a charter for an Inter-African and Malagasy States Organization.

ADDIS ABABA CONFERENCE AND THE OAU. Thanks largely to the efforts of Ethiopia's Haile Selassie, Nigeria's Abubakar Tafawa Balewa, and Guinea's Sekou Touré, it finally came about that almost all the independent African states met together to form the Organization of African Unity. On 25 May, 1963, in Addis Ababa, Ethiopia, 30 states signed a charter which stated that the purpose of the OAU was "to promote the unity and solidarity of the African states" and which pledged members to co-ordinate various political, economic, and social activities. The Organization was to have an Assembly of Heads of State and Government meeting annually, and a Council of Ministers and various special commissions which were to meet more often to implement Assembly decisions.

During 1963, the Ghana-Guinea-Mali Union, PAFMECSA, the Casablanca, and the Monrovia groups all disbanded in order that their members could concentrate their unity efforts on the OAU. After some controversy, the Brazzaville group also agreed, 1964, to cease functioning as a political body but continued economic and social co-operation.

The OAU has remained a group of sovereign states rather than a political unit. As such it has sometimes suffered from disputes among its members over frontier quarrels and interference in one another's internal affairs. But the Organization has presented a united viewpoint on such issues as *apartheid*, neocolonialism, and liberation of the remaining colonies and has thus provided an African voice in international discussion.

Postwar International Co-operation

1945-49

FOUNDING OF THE UNITED NATIONS. During World War II, support for a new organization to prevent recurrence of war developed among the allies. In the Moscow Declaration of 30 Oct. 1943, the Soviet Union, the U.S., and Britain, joined by China, agreed to seek its establishment. A proposal on organizational structure was prepared after a series of conversations held at Dumbarton Oaks near Washington, 21 Aug.-9 Oct., 1944, and agreement on most basic points was secured at Yalta, Feb. 1945. With the approach of European victory, the United Nations Conference on International Organization, representing 50 allied or associated states, met in San Francisco, 25 Apr.-26 June, to draft a Charter. A Steering Committee, composed of all heads of delegations, decided major policy questions. A 14-member Executive Committee supervised routine matters; most drafting was done by 12 technical committees of 4 commissions. The Dumbarton Oaks proposal formed the basis of discussion; few changes were made in its general outlines, since approval by the great powers was vital. Primary political powers were accorded to a General Assembly and a Security Council. The former, representing all members, received extensive powers of discussion and recommendation on international issues. The Security Council was given the responsibility of preserving peace, with real enforcement powers. It was to be composed of 5 Permanent Members: Britain, China, France, Russia, and the U.S., and 6 (later increased to 10) members elected by the General Assembly. Action on substantive matters would require agreement of 7 (later 9) members, including all 5 major states. Other organs were to include the Secretariat, the Trusteeship Council, and the Economic and Social Council. The International Court of Justice was reconstituted by a

separate statute. The Conference adopted the Charter, 25 June, and the U.S. joined, 8 Aug. With Soviet accession, 24 Oct., the Charter went into effect.

INTERNATIONAL FINANCE. In 1945 the dollar and the pound were the basic international reserve currencies. On 27 Dec., 1945, the International Monetary Fund was created, a basis being thereby established for cooperation in international monetary matters. On 18 Sept., 1949, the British pound was devalued by 30.5% in relation to the U.S. dollar; within a few days 25 countries devalued their currencies: Australia, Burma, Ceylon, Denmark, India, Ireland, New Zealand, Norway, Sweden, Union of South Africa, 18 Sept.; Canada, Egypt, Finland, Israel, Portugal, 19 Sept.; France, Iceland, Iraq, Netherlands, 20 Sept.; Belgium, 21 Sept.; Greece, Jordan, 22 Sept.; Luxembourg, 23 Sept.; Thailand, 27 Sept.; and West Germany, 29 Sept.; the devaluations involved countries accounting for almost half the world's trade and about 60% of the exports of the industrial countries.

During the 1950's most currencies remained inconvertible. In 1958 convertibility at fixed rates of exchange in the sterling area for nonresidents was introduced, and thereafter convertibility spread and there was a general decline in the restrictions on payments.

On 18 Nov., 1967, the British pound was devalued from \$2.80 to \$2.40, a change of 14.3%; Iceland followed, devaluing immediately. Other countries devalued: Israel, 19 Nov.; Guyana, Spain, Cyprus, Malawi, and New Zealand, 20 Nov.; Denmark, Jamaica, and Ceylon, 21 Nov.; Sierra Leone and Trinidad and Tobago, 22 Nov.; Iceland, 27 Nov.; and Nepal, 11 Dec.; the devaluations affected countries accounting for only 12% of world trade and only 12% of the exports of the industrial countries.

After the Second World War the world's monetary reserves (dollars,

pounds, and gold) did not increase as fast as world trade; because an expansion of international liquidity was considered essential to the continued growth of commerce, world financial leaders gave thought to new means of supplementing existing reserve assets. On 26 Aug., 1967, the "Group of 10," made up of representatives of Belgium, Britain, Canada, France, West Germany, Italy, Japan, Sweden, the Netherlands, and the U.S., agreed to a plan to establish a new kind of international monetary reserve, known as "special drawing rights" (SDR's). At a meeting in Rio, the Board of Governors of the International Monetary Fund resolved that work proceed toward the introduction of SDR's. On 16-17 Mar., 1968, the governors of the central banks of Belgium, Britain, West Germany, Italy, the Netherlands, Switzerland, and the U.S. met in Washington, D.C., and agreed to a "Dual Gold Market"; officially held gold would be used only to effect transfers among monetary authorities, and the central banks were no longer to supply gold to the London gold market or any other gold market. On the free market the price of gold would fluctuate; officially, gold would remain at \$35 per ounce. The "Group of 10" met in Stockholm, 29-30 Mar.; with the exception of the French representatives the Ministers and central bank governors in Stockholm agreed to give the necessary authority to the Executive Directors of the IMF to take steps to introduce SDR's. Their hope was that the SDR system would "make a very substantial contribution to strengthening the [world] monetary system."

INTERNATIONAL BANK. On 27 Dec., 1945, the International Bank for Reconstruction and Development (World Bank) was founded. Unlike the IMF, which sought to stabilize currencies, the IBRD's functions were to provide financing for worldwide reconstruction and development. The International Finance Corporation, an affiliate of the World Bank, was established, July 1956. The IFC was especially designed to encourage the expansion of private enterprise in less developed countries. In Nov. 1960 another affiliate of the World Bank was set

up—the International Development Association, designed to spur development financing. In 1967 the disbursements of the World Bank group (including IBRD, IFC, and IDA) exceeded \$1 billion.

INTERNATIONAL TRADE. After World War II most states had high tariffs, quantitative restrictions, exchange controls, and other restraints on international commerce, and from 1945 onward member states of the UN discussed measures designed to lead to trade liberalization. In 1947 tariff bargaining sessions were held in Geneva. A UN-sponsored international conference on trade was held in Havana, Nov., with 57 countries participating; in Mar. 1948 the conference completed preparation of the so-called Havana Charter, which provided for the establishment of an International Trade Organization to seek reductions in world trade restrictions. The U.S. Congress, however, never accepted the charter and ITO never came into existence.

Meanwhile, Jan. 1948, a General Agreement on Tariffs and Trade (GATT) had been accepted as an interim measure designed to serve until ITO was established; the tariff schedules negotiated in Geneva in 1947 were annexed to the Agreement; since ITO was never created, GATT continued and became an important institution. The 1st round of tariff bargaining under GATT was held at Annecy, France, 1949; the 2nd round was at Torquay, England, 1950-51. Geneva was the site for the 3rd round, 1956, and also for the 4th and 5th rounds, 1960-62. The 4th round involved the application of GATT rules to the European Economic Community and the 5th, the "Dillon Round," involved an exchange of tariff concessions among GATT members and included the formulation of concessions as a result of the Common Market's external tariff. While the Dillon Round was still in progress, the U.S. Trade Expansion Act, 11 Oct., 1962, became law; it provided a basis for further negotiations for the liberalization of trade. After more than a year of preliminary talks, GATT formally launched its 6th round, the so-called Kennedy Round, Nov. 1964. On 30 June, 1967, 46 members of GATT

signed the "Kennedy Round Pact," a group of agreements which provided for the gradual cutting of tariffs by as much as 50% over the ensuing 5 years; the average cuts were estimated at 35%, affected almost 6,000 items, and involved \$40 billion of world trade in industrial products; the Kennedy Round had achieved the largest tariff reductions ever made among industrial nations. Tariff concessions on agricultural products were also agreed on, as was a world grains agreement which was to guarantee higher minimum trading prices and institute a program of food aid to less developed countries of 4.5 m. metric tons of grain annually.

INTERNATIONAL COMMODITY AGREEMENTS. Of international agreements designed to stabilize commodity prices, those for wheat, sugar, tin, and coffee were the most important.

In 1949 an International Wheat Agreement was signed; the agreement was revised in 1953, 1956, and 1962; and the 1962 agreement was extended, 1965 and 1966. By 1966, exporting countries involved in the agreement included the Big 4—U.S., Canada, Australia, and Argentina—plus France, Sweden, Spain, Italy, Mexico, and the USSR (which joined for the 1st time in 1962); importing countries participating numbered 39. The 1966 agreement expired on 31 July, 1967, and an International Wheat and Food Aid Agreement was drafted as part of the GATT Kennedy Round to replace it.

An International Sugar Agreement came into force, 1 Jan., 1954, and covered about 95% of the free world market's sugar supplies. In 1960, owing to events in Cuba, the sugar agreement ran into difficulties; the U.S. government put an end, 16 Dec., to all American purchases of Cuban sugar. In the fall of 1961 international discussions on sugar quotas were held, but no agreement was reached, and on 31 Dec. of that year all regulation of the free market in sugar ended.

On 30 June, 1954, the principal tin producing countries—Malaya, Bolivia, Indonesia, Congo, Thailand, and Nigeria—signed an International Tin Agreement; all the major consuming countries, except

the U.S., also signed; but ratification was delayed and the agreement did not become operative until 1 July, 1956. Its aim was to create adequate supplies of tin at reasonable, stable prices. In Feb. 1962 a 2nd International Tin Agreement came into effect with much the same participants.

An International Coffee Agreement was signed, Sept. 1962. At that point coffee prices had been declining for 8 consecutive years. The Coffee Agreement succeeded in stabilizing prices, and an International Coffee Organization was established which included 61 countries (exporters and importers) and represented 98% of the world trade in coffee.

NUREMBERG TRIALS. German atrocities before and during World War II led the U.S., USSR, Britain, and France to agree in London, 8 Aug., 1945, to try responsible military, political, and industrial leaders. The agreement included a statute establishing the jurisdiction and functions of an International Military Tribunal, whose members were to be named by the signatories. Twenty-four individuals and 8 organizations were indicted by the allies for conspiracy to wage war, crimes against peace, war crimes, and crimes against humanity. The Tribunal heard prosecution and defense evidence in Nuremberg, 20 Nov., 1945–31 Aug., 1946. Its judgment was delivered, 30 Sept.–1 Oct. Of the 22 who were tried, 19 were convicted. Sentences ranged from 10 years' imprisonment to death; 4 organizations were proscribed. The Nuremberg trials, one of the last joint actions of the allies before the outbreak of the Cold War, was also the precedent for trials held later in Germany and in Tokyo, 1946–48.

UNIVERSAL DECLARATION OF HUMAN RIGHTS. International interest in the preservation of human rights grew during World War II, and the San Francisco Conference incorporated their protection into the UN Charter as one of the organization's purposes. In 1946, the Economic and Social Council created the Commission on Human Rights with Mrs. Franklin D. Roosevelt as its 1st chairman. Eventually the Commission and Council

produced a Declaration of Human Rights which was adopted by the General Assembly, 10 Dec., 1948. The Declaration specified many political, social, and economic rights that were to be sought as goals by UN members. Efforts to draft a convention embodying these principles failed at first, partly because of growing tensions between the U.S. and the Soviet Union, partly because of opposition to UN action in domestic affairs. The deadlock continued throughout the Cold War, until 2 conventions were approved by the Assembly, 16 Dec., 1966. Other efforts had more immediate success. The Convention on the Prevention and Punishment of the Crime of Genocide received Assembly approval, 9 Dec., 1948, becoming effective in 1951. The Convention on the Political Rights of Women entered into force in 1954. Slavery and forced labor were also reviewed by the Economic and Social Council, as were the rights of national minorities. In a number of resolutions, the Assembly condemned racial discrimination in South Africa, and the Security Council eventually decreed sanctions against that country for its continued violations of human rights.

REFUGEES. The UN Relief and Rehabilitation Administration (UNRRA) was created, 9 Nov., 1943, to deal with the refugee problem after the Second World War. The war and the flight or expulsion of populations from Eastern Europe produced a vast care and resettlement problem which UNRRA proceeded to meet. Although the organization performed vital services for European and Far Eastern refugees in the postwar world, increasing Cold War tensions led to its dissolution. In its place, the General Assembly established the International Refugee Organization (IRO), 14 Dec., 1946. Lacking general international support, IRO did not complete accepting transferred functions from UNRRA until late in 1948. After substantially completing its work in Europe, IRO was succeeded by the Office of the UN High Commissioner for Refugees, created on 3 Dec., 1949. Becoming operational on 1 Jan., 1951, this Office experienced difficulties in its early years, but eventually

secured broad international backing, and continues the work of UNRRA and IRO throughout the world. In addition to these general organizations, the Assembly created the UN Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), 8 Dec., 1949, to aid those displaced by the Arab-Israeli hostilities of 1948.

1950-59

TRUST TERRITORIES. The UN Conference at San Francisco left disposition of former League mandates and Italian colonies to interstate negotiations, subject to approval by the General Assembly, or the Security Council in the case of "strategic" territories. The UN Trusteeship Council was to supervise administration. By 1 Nov., 1947, the General Assembly had approved agreements covering 9 former mandates; South Africa never accepted UN supervision of South-West Africa. On 2 Apr., 1947, the Security Council approved the "strategic" United States Trust Territory of the Pacific Islands. When negotiations over former Italian colonies failed, their disposition was submitted to the General Assembly for final determination. On 21 Nov., 1949, that body recommended independence for Libya on 2 Jan., 1952, and suggested that Italy should administer Somaliland as a trust territory for 10 years. The Trusteeship Council accepted the terms of the Somaliland agreement, requiring direct supervision by an Advisory Council, and on 2 Dec., 1950, the General Assembly gave final approval, establishing the last UN Trust Territory. Ethiopia received Eritrea on 11 Sept., 1952. In the next decade the Trusteeship Council exercised active supervisory powers, utilizing Visiting Missions, and by 1967 all but 3 Trust Territories were independent.

SPECIALIZED AGENCIES OF THE UN. With the outbreak of the Korean War in 1950, relations between the U.S. and the USSR, and their allies, reached their lowest point. It was in the UN and its specialized agencies that regular cooperative contacts between the eastern and western blocs were maintained.

These agencies were created by intergovernmental agreement and associated with the UN through the Economic and Social Council. Among those created soon after World War II were the Food and Agriculture Organization (FAO), the UN Educational, Scientific, and Cultural Organization (UNESCO), the World Health Organization (WHO), the International Bank for Reconstruction and Development (IBRD), and the International Civil Aviation Organization (ICAO). The World Meteorological Organization (WMO) was formed in 1951. Some of these provide services, like FAO, concerned with increasing food supplies and preventing famine; WHO, combating epidemic diseases and promoting public health; and WMO, providing worldwide weather observations. IBRD aids underdeveloped states financially, and UNESCO promotes literacy, research, and protection of cultural properties. Others are regulatory, like ICAO, which sets standards for international air navigation and transport. The older agencies include the International Labour Organization (ILO), the International Telecommunications Union (ITU), and the Universal Postal Union (UPU). These are primarily regulatory, with the ILO acting through the device of multilateral conventions. In recent years, all agencies have increased their interest in aiding underdeveloped nations through technical assistance.

UN SECRETARIAT. The Secretariat is the administrative arm of the United Nations. Headed by a secretary general chosen by the Security Council, the civil servants of the Secretariat are selected by, and responsible to, him. In carrying out decisions of the political organs, it is presumably impartial; members are expected to serve the organization, not national or ideological interests. The secretary general possesses wide powers of a political nature, including the right to bring issues before the Security Council. The Council and Assembly frequently grant him broad discretion in implementing their decisions, and he exercises independent investigative and diplomatic functions. Trygve Lie of Nor-

way was the 1st secretary general. Elected before the start of the Cold War, he was caught in the middle of the struggle between the U.S. and the Soviet Union. The latter boycotted him after 1951 because of the Korean War; in late 1952 suggestions of Communist infiltration of the Secretariat disturbed the U.S. Unable to ease international tensions, Lie announced his earlier decision to retire, 10 Nov. With the election of Dag Hammarskjöld of Sweden, Apr. 1953, an era of activism began, evidenced in the 1958 Lebanon crisis and the 1960 Congo crisis. After Hammarskjöld's death, U Thant of Burma was chosen, Nov. 1961, and continued the role of conciliator and mediator between East and West.

ATOMS FOR PEACE. With the end of the Korean War, the atmosphere for international negotiation improved, and the 1st detonation of a Russian hydrogen bomb, 12 Aug., 1953, turned thoughts in the U.S. toward promoting the peaceful applications of atomic energy. The concept of the internationalization of nuclear energy for nonmilitary purposes had first been advanced by the U.S. as part of a comprehensive arms control plan on 14 June, 1946. This Baruch Plan had been almost forgotten when, 8 Dec., 1953, President Dwight D. Eisenhower put forward his "Atoms-for-Peace" proposal in a speech before the General Assembly. International reaction was favorable, after initial Soviet hesitation. Following several years of negotiation, the International Atomic Energy Agency (IAEA) was established as a UN subsidiary, 23 Oct., 1956, with support from both East and West. This organization assists states in their development of nuclear power for peaceful purposes. It operates as a bank through which fissionable materials are provided to nonnuclear powers under adequate safeguards. In addition, it promotes research in the peaceful uses of atomic energy and provides technical assistance in this field to developing nations.

GENEVA CONFERENCE ON FAR EASTERN AFFAIRS. Since 1946, France had been faced with a growing independence movement in Indochina. Attempts

to create national regimes linked to the French Community in Cambodia, Laos, and Vietnam had failed. By 1954, the revolutionary forces, including Communists, were steadily gaining strength. On 18 Feb. the Berlin 4 Power Conference of Foreign Ministers agreed to convene a Conference on Far Eastern Affairs under British and Russian cochairmanship in Geneva on 26 Apr. Representatives of 19 countries, including the U.S., mainland China, and France, attended. After Dien Bien Phu fell to Communist-led forces on 8 May, 3 Accords were signed by all participants except the U.S. and the incumbent Vietnamese government on 21 July. They provided for suspension of hostilities, withdrawal of foreign forces, and complete independence for Cambodia, Laos, and Vietnam. Vietnam was partitioned between a Communist regime in the North and the incumbent regime in the South, pending 1956 elections. Simultaneously, the U.S. stated that it would respect the Accords and view their violation with concern. Although the system later broke down, these agreements represented an early effort at stabilization of conflict through direct East-West negotiations.

GENEVA "SUMMIT" CONFERENCE. In the decade following the 1945 Potsdam Conference, the hardened positions and mutual distrust engendered by the Cold War prevented additional direct contacts between the leaders of the U.S. and the Soviet Union. However, partial successes at the 1954 Berlin 4 Power Conference of Foreign Ministers led to increased support for similar meetings at a higher level. The Austrian State Treaty of 15 May, 1955, ending the postwar division and occupation of Austria after years of discussions, showed that agreement was possible. Encouraged by the progress of these negotiations, in early May the western states proposed a 4-nation "summit" conference of heads of government to convene in Geneva on 13 July. When the conference was held, its results were insubstantial; the division between East and West was still too great. Nevertheless, the participants did succeed in lessening tensions to some degree and

obtaining a better understanding of each other than would have been possible at the height of the 'Cold War. The Geneva Conference of Foreign Ministers, which followed on 27 Oct., was even less successful. German reunification was an obstacle, and renewed acrimony marked the meeting, although agreements on increased cultural exchanges were negotiated.

SUEZ CRISIS. On 29 Oct., 1956, Israel invaded Egypt in retaliation for Egyptian support of terrorist attacks upon Israeli territory. Israeli troops advanced rapidly toward the Suez Canal. By prearrangement with Israel, Britain and France demanded withdrawal of all belligerent forces from the Canal and permission to intervene to safeguard the waterway. When Egypt refused, Britain and France bombed Egyptian airfields, 31 Oct., and on 5 Nov. landed troops near the Canal. International reaction was swift. The Soviet Union, though engaged in crushing a rebellion in Hungary, condemned the invasion. The U.S. also denounced the intervention, and worked to secure withdrawal. More by accident than by design, the U.S. and the USSR voted together in the Security Council to demand withdrawal. When British and French vetoes prevented action, the U.S. supported a Yugoslav resolution transferring the issue to the Assembly. On 1 Nov. the Assembly demanded a cease-fire, and on 4 Nov. it requested the secretary general to establish a UN Emergency Force (UNEF) to police the cease-fire and supervise withdrawal. Faced with opposition by the major powers, on 7 Nov. Britain, France, and Israel agreed to end the fighting. On 14 Nov. units of UNEF, the 1st truly international UN police force, arrived in the Suez area; removal of troops began by 23 Nov. The Suez crisis marked a turning point in the Cold War; relations within and between blocs were never the same again.

INTERNATIONAL GEOPHYSICAL YEAR. Growing demands for planet-wide information by scientific communities of all nations, reinforced by the speed of scientific progress and improvements in information-gathering techniques, led to the institution of the International Geo-

physical Year (IGY) of 1 July, 1957–31 Dec., 1958. In the 18 months of the IGY, scientists of 66 countries co-operated in research and data-gathering projects on a nonpolitical basis. Studies of the earth, its atmosphere, and outer space were conducted by groups that made their discoveries available to all participants. Exploration of outer space was highlighted by the launching of the 1st artificial earth satellite by the USSR on 4 Oct., outside the framework of the IGY. This was followed by a similar U.S. launching on 31 Jan., 1958. Exploration in Antarctica by scientific teams of several nations laid the foundations for co-operation which later resulted in the 12-state Antarctic Treaty of 1 Dec., 1959, an agreement that demilitarized Antarctica and suspended territorial claims there. The synoptic and interdisciplinary information gathered and made available to the world's scientists in this period was vast; the process of sorting alone required several years.

1ST GENEVA CONFERENCE ON THE LAW OF THE SEA. Under the UN Charter, one of the duties of the General Assembly is that of promoting the development and progressive codification of international law. To accomplish this purpose, the Assembly created the International Law Commission, 21 Nov., 1947. Despite the pressures of the Cold War, the Commission carried out its mandate in many fields. Among its accomplishments, the development of the law of the sea is outstanding. In 1956 the group adopted a proposed convention codifying the law in this field. On 21 Feb., 1957, the Assembly called for an international conference to consider the suggestions, and the 1st Geneva Conference on the Law of the Sea convened, 24 Feb., 1958. Representatives of 86 states, including the Soviet Union and the U.S., attended. Despite the expected disagreement stemming from strongly conflicting national interests in the regime of the seas, the Conference produced 4 multi-lateral conventions covering the continental shelf, the high seas, fisheries, and territorial waters. The success of the 1st Conference led to the 2nd Conference, 1960, to consider questions that remained

unanswered. Although further agreement was not reached, the 2 Conferences were models of international co-operation in the resolution of conflicting nonpolitical claims.

INCREASING EAST-WEST CONTACTS. In the years after the 1955 Geneva "Summit" Conference, communication between East and West continued to increase. In 1959 this exchange of contacts multiplied. The 24 July–2 Aug. trip of the American vice-president to Moscow for the opening of a U.S. trade fair followed closely upon a visit by the British prime minister. Later, on 15–27 Sept., the chairman of the Council of Ministers of the USSR, Nikita S. Khrushchev, toured the U.S. In this 1st visit by a Soviet Russian head of government to the Western Hemisphere, talks held with President Dwight D. Eisenhower helped reduce some tensions of the period. During these visits, arrangements were made for a 4-nation meeting, to be held in Paris in 1960. Although the Paris "Summit" Conference ended abruptly in failure, official high-level contacts continued. At the same time, the cultural and other exchange programs that had been instituted earlier continued to spread, and East-West trade in nonstrategic goods began to grow. The period also saw increasing numbers of western tourists in Russia, contributing to a decline in the strong popular distrust that had developed in both blocs after World War II.

1960–68

CONGO CRISIS. Belgium granted the Congo independence on 30 June, 1960. During the colonial period, little had been done to prepare the Congolese for self-government, and disintegration soon began. Army mutinies spread, endangering European lives and property, and impelling Belgium to intervene militarily. On 11 July the major province of Katanga seceded. In response to these events, the Security Council, with East-West support, created a UN Force under the direction of Secretary General Dag Hammarskjöld, 14 July, to end both intervention and violence. The Congolese central

government collapsed into 2 competing factions, 5 Sept., and the neutrality of the secretary general in refusing to recognize the group supported by the USSR led to Soviet demands for a 3-man Secretariat leadership, or "troika." The operation continued, however, and on 21 Feb., 1961, the Council authorized the use of force to prevent civil war. After the central government crisis was resolved on 2 Aug., 1961, in favor of the pro-western faction, Soviet disinterest grew, prompting refusals to pay assessments for the operation. When the secretary general died in a plane accident, 18 Sept., 1961, while in the Congo, "troika" demands were again raised, but the appointment of Secretary General U Thant on 3 Nov., 1961, ended the controversy. Eventually the action was successful in removing a source of tension and preserving Congolese unity; after several minor clashes, Katangese secession ended, 21 Jan., 1963, and troops were withdrawn on 30 June, 1964.

THE DEVELOPMENT DECADE. As old colonial empires dissolved, the number of independent nations increased rapidly. In 1960, a total of 16 states from Africa alone were admitted to UN membership, and in the following years still more were added. Since most of these countries were underdeveloped and in need of assistance to achieve economic viability, demands increased. Early multilateral aid programs had been carried on under the UN through the Expanded Program of Technical Assistance (EPTA), established in 1949, and the Special UN Fund for Economic Development (SUNFED), created in 1956. Additionally, specialized agencies, particularly the International Bank for Reconstruction and Development, had also been established to provide assistance. These international efforts, even when added to the vast American and Soviet bilateral programs, were unable to meet rising demands. These difficulties caused the underdeveloped states to try to use their increased UN voting strength to mandate increasing aid programs. Although this occasionally led to a common U.S.-Soviet front to defeat excessive demands, both supported the General Assembly resolution, 19 Dec.,

1961, declaring the 1960's a "Development Decade." A goal of increasing annual growth rates in underdeveloped nations to 5% was adopted, and developed countries were urged to participate more fully in multilateral efforts. Although the first half of the decade was unsuccessful, the institution of the UN Conference on Trade and Development, 1964, an increasing emphasis on multilateral aid, and the merger of EPTA and SUNFED into the UN Development Program, 1966, gave hope for later success.

NEUTRALIZATION OF LAOS. Although the 1954 Geneva Accords on Indochina resulted in peace in Laos for several years, Communist-led outbreaks against the national government began in 1959. A neutralist government was created in 1960, but pro-western military forces took control later that year. The neutralists allied with the Communist Pathet Lao, and hostilities continued with both sides receiving outside support. On 24 Apr., 1961, Britain and the Soviet Union called for a new Conference on Laos; it opened in Geneva, 16 May, 1961. Representatives of East and West encouraged the leaders of the Laotian factions to agree on a common program, and on 22 June, 1961, they did so. A national government was established under neutralist leadership, June 1962, and a Declaration of Neutrality was made on 9 July. This was incorporated into the Final Declaration of the Conference, 23 July. The attending states, including the U.S. and mainland China, agreed to recognize the independence and neutrality of Laos and to refrain from further intervention. Although unrest continued, it was primarily of local origin, and the Geneva Conference did succeed, at least for a time, in eliminating another point of contention between East and West.

NUCLEAR TEST BAN TREATY. Early disarmament proposals, such as the 1946 Baruch Plan and the 1955 "Open Skies" proposal made at the Geneva "Summit" Conference, were unsuccessful in the years following World War II. Although both the U.S. and the Soviet Union continued to advance suggestions for general and complete disarmament, it

became clear that the continuing Cold War made agreement on such proposals unlikely. Instead, the interest of the major powers turned to control of atomic weapons, as a step toward eventual total disarmament. In 1959 and 1960 the USSR and the U.S. suspended nuclear testing temporarily, but the moratorium ended in 1961. Negotiations continued, and agreement on a partial nuclear test ban was reached in Moscow, 5 Aug., 1963. The resultant treaty, effective on 10 Oct., prohibited atomic testing in the atmosphere, under water, and in outer space. Of the nations possessing nuclear capabilities, the U.S., USSR, and Britain acceded to the treaty. France and mainland China, allied respectively with the U.S. and Soviet Union, did not adhere, thus pointing up the growing disunity within the formerly monolithic opposing blocs. Efforts in disarmament continued, directed largely at the problem of nuclear proliferation and the question of eventual total disarmament.

CYPRUS. Strong hostility between the Greek Cypriots, who desired union with Greece, and the island's Turkish minority delayed independence for Cyprus until constitutionally guaranteed privileges for the protection of the Turks were accepted. When Britain granted independence, 16 Aug., 1960, Greece, Turkey, and Britain signed a Treaty of Guaranty with Cyprus to assure its continued existence. Attempted constitutional changes disadvantageous to the minority triggered violence, 21 Dec., 1963, and fear of Turkish intervention led Cyprus to appeal to the Security Council. After an observation mission appointed by the secretary general had reported, the Council acted, 4 Mar., 1964. The vote underlined how greatly the rigidity of the eastern and western blocs had continued to alter over the years. France decided to abstain together with the USSR and Czechoslovakia, while the Soviet Union's allies joined the majority in recommending that the secretary general establish a UN Force to be supported by voluntary contributions. Although the Force formed rapidly and contributed to the maintenance of order, the truce that was estab-

lished remained uneasy. The secretary general was compelled to request repeated extensions of the life of the Force. Nevertheless, it did constitute an example of a multilateral peacekeeping operation undertaken and continued with Soviet acquiescence.

UNITED NATIONS FINANCES. In the Suez and Congo crises, UN action was based partly upon resolutions of the General Assembly instead of the Security Council. Several states, including the Soviet Union and France, challenged the legality of assessments levied for expenses incurred under these resolutions, and refused payment. By 1964, 16 countries were sufficiently in arrears to fall within the Charter provision requiring that they be deprived of their General Assembly votes. At the 1964 Assembly session, a constitutional crisis was avoided by acting only with unanimous consent, thus making votes unnecessary. A Special Committee on Peacekeeping Operations was established, 18 Feb., 1965, to review the financial problems of the organization and recommend solutions. The committee met during 1965, and on 31 Aug. approved a proposal designed to solve existing difficulties. This compromise provided that the Assembly would proceed normally, and that the question of voting would not be raised. The budget deficit would be met by voluntary contributions, primarily from the developed nations, including the U.S. and the Soviet Union. The compromise was accepted before the 1965 session opened on 21 Sept., and the UN was able to function normally, saved from a constitutional crisis by international cooperation and compromise.

INTERNATIONAL COURT OF JUSTICE. An organ of the UN, the International Court of Justice (ICJ) is composed of 15 judges elected to 9-year terms by the General Assembly and Security Council. Advisory opinions may be requested by other UN units, but only states may refer actual controversies to it. The Court's jurisdiction over such disputes arises from either specific agreements to refer questions or prior acceptance of its compulsory jurisdiction by

unilateral declaration. Since its creation as the successor to the Permanent Court of International Justice, the ICJ has acquired compulsory jurisdiction over more than 40 states, some with reservations. When a dispute is brought before the Court, an *ad hoc* judge is named by each party to the controversy. Among the disputes settled by the ICJ were the *Corfu Channel* case of 1949, and the *Asylum and Norwegian Fisheries* cases of 1951. In the 1962 opinion on *Certain Expenses of the United Nations*, the Court upheld certain UN peacekeeping operations and assessments to support them as valid, resulting in the 1965 negotiations on UN finances. The 18 July, 1966, decision to reject, on procedural grounds, complaints against South Africa in the *South-West Africa* case illustrated the Court's reluctance to deal with political questions, and its ability to function independently.

PEACEFUL USES OF OUTER SPACE. The international community took an early interest in the exploration and exploitation of outer space. On 12 Dec., 1959, a permanent UN Committee on the Peaceful Uses of Outer Space was created to report on international aspects of space exploration. ITU, WMO, and UNESCO soon became involved with programs in space communications, weather observation, and scientific research; on 20 Dec., 1961, a UN Registry of Space Vehicles was established. The UN played a major role in the development of rules for space exploration. On 17 Oct., 1963, the Assembly urged that states refrain from orbiting weapons of mass destruction, and on 13 Dec., 1963, adopted a declaration of principles governing the exploration and use of outer space. These resolutions were later embodied in a treaty which received

Assembly approval on 19 Dec., 1966, and which was signed by over 60 nations, including the U.S. and the USSR, 27 Jan., 1967. Its major provisions restrict military uses of space and call for free access to space installations. Additionally, it provides for peaceful co-operation by setting standards and promoting dissemination of information. Approval of the Outer Space Treaty by the U.S. Senate, 25 Apr., was a landmark of the developing international consensus of the 1960's.

U.S. MOON LANDING. Preparatory to the 1st successful moon landing, the U.S. launched, 11 Oct., 1968, the 1st manned flight of an Apollo spacecraft (Walter M. Schirra, Jr., Donn F. Eisele, R. Walter Cunningham), and the 1st manned voyage around the moon (launched 21 Dec.) was made in Apollo 8 by Frank Borman, James A. Lovell, Jr., and William A. Anders. The U.S.S.R. Soyuz 5 (launched 15 Jan., 1969) rendezvoused with Soyuz 4 (Yeliseyev and Khrunov). U.S. astronauts James A. McDivitt, David R. Scott, and Russell L. Schweikart, in an Apollo 9 space flight, docked with a lunar model (launched 3 Mar., 1969). On 18 May astronauts Thomas R. Stafford, Eugene A. Cernan, and John W. Young descended in Apollo 10 to within 9 mi. of the moon. Climaxing 8 yrs. of manned space flight competition between the U.S. and the Soviet Union, U.S. astronauts Neil A. Armstrong and Col. Edwin E. Aldrin, Jr., taking off 16 July in Apollo 11, touched down on the moon with their lunar module. Armstrong's 1st step on the moon was taken 20 July at 10:56:20 EDT. After taking rock and soil specimens, the pair successfully rendezvoused with Lieut. Col. Michael Collins, navigator of the Apollo craft, and splashed down 950 mi. S.W. of Hawaii, 24 July.

II

TOPICAL
CHRONOLOGY

ECONOMIC DEVELOPMENT AND TECHNOLOGY IN AN AGE OF REVOLUTION

Introductory. The period 1760–1968 witnessed a rapid and unprecedented rise in per capita income in Europe, North America, Australia, and New Zealand. The “West” came to regard economic growth as a normal condition. In the 19th and early 20th cents. relative economic stagnation was replaced by economic

growth in many nations—from Argentina to Japan. Changes in the economic structure of nations took place. After World War II, governments throughout the world—in Latin America, Africa, the Middle East, Asia, and also in Europe and the United States—turned their attention to economic development.

1760–1830

The First Industrial Revolution—Great Britain

SCIENTIFIC AGRICULTURE AND ANIMAL HUSBANDRY. The British Industrial Revolution was characterized initially by an agricultural revolution. Jethro Tull (1674–1740) had demonstrated the need for selectivity in the choice of seed, sowing in rows, deep hoeing, and plowing, and had invented the seed drill; his innovations provided new techniques in constant tillage. Charles Townshend (1671–1738) promoted scientific crop rotations and advocated use of the turnip in crop rotation. Robert Bakewell (1725–95) taught improved stock breeding. Arthur Young (1741–1820) popularized new farming techniques and large-scale farming. 1771: John Brand of Lawford (Essex) manufactured the 1st all-iron plow, although by 1830 most English farmers still used wooden plows. 1772: Thomas Coke (1752–1842) in Norfolk started reforms in animal husbandry; later Coke was successful with 4-crop rotation (the “Norfolk System”). C. 1784: Scotsman Andrew Meikle made 1st threshing ma-

chine. 1798: John Wilkinson, British iron-maker, installed a steam-powered threshing machine; he also innovated in land reclamation and reforestation schemes. Before the end of the 18th cent. Irishmen, Scots, Frenchmen, Americans, Germans, and Flemings considered England their agricultural mentor.

New crops: Novel fodder crops—clover and rye grass, alfalfa, roots, swedes, cabbages, carrots as well as turnips tried in crop rotation. 1795–1814: Potato acreage in England increased an est. 60%.

Land reform: The enclosure movement of the 18th cent. involved the fencing and consolidation of medieval open fields, which had formerly been farmed in small, discontinuous strips by peasants who had shared the right of pasture, fuel, and game on common land. It also involved the enclosure of waste lands. Enclosure replaced small holdings with large-scale farming, using advanced methods. 1710–60: Est. 300,000 acres were enclosed; 1760–1843: est. 7 million acres enclosed.

1801: Parliament passed the 1st General Enclosure Act.

Agricultural productivity: Because of new agricultural techniques and because enclosures increased the productive land in England, agricultural productivity (output per man) rose sharply. There were food surpluses to meet demands from growing urban centers. Because of enclosures, peasants were turned off the land and became wage laborers and purchasers of food. Increasingly, agriculture became concerned with producing for national markets rather than for local consumption. Rising prices of corn in the 2nd half of the 18th cent. encouraged greater production.

Price rise: 1793-1815: Due to war demands agricultural prices soared, which stimulated the growing of additional crops for sale. Rising prices meant profits for reinvestment in agriculture and industry. The changes in English agriculture caused a breakup of village life and an end to traditional patterns. Estimates indicate that in 1811 and all years prior to that agriculture, forestry, and fishing provided the greatest percentage of British national income. In 1821 and all years thereafter the manufacturing, mining, and building sector exceeded the agricultural sector.

INDUSTRIAL RAW MATERIALS. Britain was well-endowed with raw materials needed for industrialization, namely, coal and iron. Cotton for the textile industry could be imported; the use in the American South of the cotton gin, invented, 1793, by Eli Whitney (1765-1825), sharply reduced the cost of raw cotton.

LABOR. A demographic revolution took place in England and Wales, with population expanding rapidly. Estimates: 1760, 6.6 million; 1830, 16.4 million. The

population of England and Wales increased 7% in the decade 1760-70, 11% in the decade 1780-90, and 16% in the years 1810-20. Rising population meant a demand for goods—a market for food and industrial products. Men moved from rural areas to urban centers because of changes in agriculture and because of the pull of industry. 1800: Greater London had a population of 959,000 and was the largest city in the world, but population estimates indicate that the number of inhabitants in rural areas grew almost as rapidly as in the cities. The growth of population was the main reason for labor surpluses from which the industrial labor force could be drawn. Labor became wage labor. Slavery never existed on a large scale in England; in 1772 Lord Chief Justice Mansfield ruled it illegal. Henceforth, all labor was free labor. Education was at a high level in England (compared with the rest of the world); literacy was important for the success of the Industrial Revolution.

STEAM POWER. Industry was revolutionized by steam power. 1698: Devonshire inventor Thomas Savery (1650?-1715) patented a steam engine for use in pumping mines; it was not successful for this purpose, but was utilized in water-supply systems. 1712: Blacksmith and ironmonger from Devonshire Thomas Newcomen (1662-1719) built the 1st successful steam engine to be employed in pumping water from copper, tin, and coal mines. 1765: Scotsman James Watt (1736-1819) devised a separate condensing chamber, making the steam engine suitable for more extensive application. 1769, 5 Jan.: Watt patented his 1st engine with the separate condenser. 1774: Hardware manufacturer Matthew Boulton (1728-1809) agreed to finance Watt and to allow

STRUCTURE OF THE BRITISH NATIONAL PRODUCT
(% of national income)

	<i>Agriculture, Forestry, Fishing</i>	<i>Manufac- tures, Mining, Building</i>	<i>Trade, Trans- port, and In- come from Abroad</i>	<i>Government, Domestic, and Other Services</i>	<i>Housing</i>
1811	35.7	20.8	16.6	21.7	5.7
1821	26.1	31.9	16.3	19.3	6.2
1831	23.4	34.4	18.4	18.1	6.5

the latter to use his employees to perfect the machine. 1776: Watt completed his 1st successful engine at Boulton's Birmingham works. The Boulton-Watt steam engine was the 1st practical steam unit for industrial purposes. Watt adapted the engine to rotary motion, 1781; invented the reciprocating expansion engine, 1782; applied the steam engine to tilt hammers in iron and steel forges, 1784. 1785. Cotton mill at Papplewick was 1st textile plant to use a steam engine. 1775-1800: Boulton and Watt built 289 steam engines (84 for cotton mills, 9 for wool and worsted mills, 30 for coal mines, 28 for foundries and forges, 22 for copper mines, 18 for canals, and 17 for breweries). Steam power made possible urban factories, created innovations in transportation, and had linkage effects in the iron and steel industry. Steam engines required precise working parts, which encouraged the use of new machine-tools to make the parts and encouraged new developments in the metallurgical industries.

INDUSTRIES AND TECHNOLOGICAL ADVANCE. The cotton textile industry: Expansion was stimulated by the demand for cotton textiles whetted initially by imports brought in by the East India Company. 1733: John Kay (1704-64) invented the flying shuttle. 1769: Richard Arkwright (1732-92) patented the water frame, introducing the possibility of power spinning; 1770: James Hargreaves (d. 1778) patented the spinning jenny. 1779: Samuel Crompton (1753-1827) combined the water frame and the jenny in the "mule." 1785: Edmund Cartwright (1743-1823) invented the 1st power loom; 1813: 2,400 power looms in England; 1829: roughly 50,000 power looms in England. After 1785, with the application of steam power to this industry and with the new technology, the mill could be moved from the stream to urban centers, where labor was available. By 1830, cotton textile production was a factory industry; hand spinning had ceased and all processes prior to weaving were done in the factory; weaving took place partly in the factory on power looms and partly still in homes on hand looms. From a relatively insignificant in-

dustry in 1760, by 1831 cotton textile production employed over 800,000; cotton textiles had become the major British export. Improvements in this industry were followed (at varying speeds) by producers of wool and other textile fibers. Most important, textiles were a primary manufacturing sector: by 1830, expansion was generating employment in the making of power equipment, machinery, and, in turn, in the basic iron and steel industry.

The revolution in iron: 1589: 1st patent for use of coal in ironmaking. 1709: Abraham Darby (1676-1717) used coal as a substitute for charcoal in smelting iron in blast furnaces 1776: John Wilkinson (1728-1808) introduced steam blast for smelting iron with coke. 1783-81: Henry Cort (1740-1800) took out 2 patents for "puddling" and "rolling." 1784: The Boulton-Watt steam engine applied to iron production—for the bellows, the hammers, rolling, and slitting. 1786: John Smeaton used blowing cylinders of cast iron at the Carron ironworks. 1827: J. B. Neilson invented the hot blast (patented 1828), which more than cut in half the coal or coke required to smelt iron. The use of coal (instead of charcoal) and steam as a source of power opened the possibility of large, integrated iron works, a single concern could do smelting and refining. 1788: Britain's 59 coke furnaces produced 53,800 tons of pig iron, while 26 furnaces produced 14,500 tons of charcoal iron; 1806: Britain's output of 250,400 tons of pig iron practically all came from coke furnaces. 1830: Production rose to 677,000 tons, due to demands for iron in making steam engines, machinery, apparatus of various sorts, and water pipes. 1805: Because of its use of coal, England became the world's greatest iron producer (surpassing the earlier leaders of 1740, Russia and France).

Steel: Pig iron could be transformed into cast iron in the foundry, into wrought iron by the puddling process, or into steel. Most pig iron was converted into cast or wrought iron and only a small quantity into steel. Blistered steel and sheet steel were made in cement furnaces and used for swords, knives, and razor blades. 1740: Benjamin Huntsman (1704-

76) developed a process for making "crucible" or cast steel. 1787: Some 20 Sheffield steel refiners used this method. 1800: David Mushet (1772-1847) patented a process to make steel directly from bar iron. Innovations made poor-grade iron usable in steel.

The machine-tool industry: 1777: Jesse Ramsden (1730-1800) described a screw-cutting lathe. 1797: Henry Maudslay (1771-1831) invented the carriage lathe; Maudslay was the key maker of industrial lathes in England; his shop was the training ground for English machine-tool builders, among them Joseph Clement (1779-1844), Richard Roberts (1789-1864), Joseph Whitworth (1803-87), and James Nasmyth (1808-90).

The chemical industry: Innovations related mainly to developments in textiles. 1797, 1799: Charles B. Tennant (1768-1838) took out patents for bleaching powder, made by absorbing chlorine in slaked lime.

Gas lighting: 1792: William Murdock (1754-1839) used coal gas to light a room in a home in Redruth, Cornwall (gas lighting had been used earlier in Germany). 1805: Coal gas used in lighting a factory in Great Britain; 1806: in London, German-born Frederick Albert Winsor formed the world's 1st gas co., the National Light and Heat Co. (later the Gas Light and Coke Co.); 1807: gas lighting installed on Pall Mall in London.

Other technological innovations: 1809: The arc lamp invented by Sir Humphry Davy (1778-1829); 1821-31: Michael Faraday (1791-1867) developed the electric motor and generator. 1822: Charles Babbage (1792-1871) developed the principles of a calculating machine. 1760-1830: Rapid rise in number of English patents sealed in each decade: 1760-69, 205 patents; 1780-89, 477 patents; 1800-9, 924 patents; 1820-29, 1,453 patents.

TRANSPORTATION REVOLUTION. **Roads:** In mid-18th cent., roads in England were inadequate and in poor repair. 1767: A road went down the Taff Valley; earlier coal had been shipped from the Merthyr and Dowlas district along a path on the backs of ponies and donkeys. Three great road engineers, J. Metcalf

(1717-1810), Thomas Telford (1757-1834), and John Loudon McAdam (1756-1836), made major improvements. McAdam replaced unbroken flints with a packing of angular granite fragments, which consolidated into a natural concrete (macadam); c. 1815: 1st macadam road completed; the new highways were smooth and well drained. Turnpike companies were formed for road repair and construction. 1784: The 1st mail coach left London for Bristol; the Post Office began to promote road construction. The stagecoach provided regular service and horse-drawn wagons moved goods along the new roads. 1784: James Watt patented a steam-driven carriage; 1800: English engineer Richard Trevithick (1771-1833) invented a steam engine which he used to propel carriages, but steam-propelled road vehicles were not produced commercially.

Inland waterways: In the mid-18th cent. rivers near Wigan and St. Helens were improved to handle the increased coal trade. 1759-61: James Brindley (1716-72) built a canal from Worsley to Manchester for shipments of coal for the coal owner, the Duke of Bridgewater, this "Bridgewater Canal" was the 1st great accomplishment of the "canal age"; the canal "mania" began. 1830: There were 3,639 miles of canals and canalized rivers in England.

Steamships: 1801: First practical British steamboat—the *Charlotte Dundas*—was built by William Symington (1763-1831); 1812: Henry Bell's steamer, the *Comet*, with side paddle wheels appeared on the Clyde. 1814: England had 2 steamers; 1830, 315 steamers. 1826: The British steamer *Enterprise*, en route to India, used steam power on 63 days of 103-day trip. (The rest of the voyage was under sail.)

Railroads: Before 1820, the Newcastle area had some 360 miles of railroad; traction was by cable attached to a fixed engine or to a horse. 1802: Trevithick was the 1st in the world to use a steam-propelled carriage on a railroad. 1814: George Stephenson (1781-1848) built his 1st locomotive. 1825: Stockton and Darlington Railway opened, with Stephenson driving a steam-powered train; this was the

world's 1st public passenger-carrying railway, but passenger traffic was by horse-drawn coach until 1833.⁶ 1829: Stephenson's *Rocket* demonstrated the superiority of steam locomotion over the horse. 1830, 15 Sept.: Manchester & Liverpool Railway opened; it used locomotive power for traction, it was built to carry passengers as well as freight; it marked the start of the "railway age." The Industrial Revolution was for all practical purposes completed before the introduction of railways using steam power.

FINANCE. 1760: England had the world's highest per capita income. In general capital was invested in government securities and land. Capital had been accumulated by British merchants who accrued large fortunes through foreign trade. Financial intermediaries had developed. Britain had an established system of money and banking. The Bank of England (formed in 1694) was a semipublic, semiofficial institution to lend money to the government, receive deposits, and make commercial loans. The 18th-century pound was theoretically based on silver (the pound *sterling*). By the 1760's, there was little silver coin in circulation; actually, but not legally, Britain was on the gold standard. 1816: Gold was made the sole standard and full legal tender; 1821: this took effect, and Britain formally and legally went onto the gold standard. At this time, British banking consisted of the Bank of England, 60 London private banks (without note issue), and roughly 800 private small note-issuing country

banks. Among the most prominent of the London private banks were Baring Brothers, founded in 1770 by Francis Baring (1740-1810), and N. M. Rothschild & Son, founded in 1798, a branch establishment of the House of Rothschild, Frankfurt. 1825-26: Financial crisis resulted in the failure of some 60 country banks. 1826: Parliament passed an act which allowed the Bank of England to establish branches throughout the United Kingdom and which permitted the establishment of joint-stock banks outside of a radius of 65 miles of London. (1833 Act permitted joint-stock banks to be established in London area.) Banking for merchants, manufacturers, and farmers, which had been done mainly by private banks before 1826, came increasingly to be done by joint-stock banks owned by security holders. 1810: Formation of the Ruthwell savings bank in Scotland; the savings-bank concept spread from Scotland to England and Wales. Insurance companies in England provided sources of savings. The last decade of the 17th cent. had seen a money market develop in England and a stock exchange. 1773: London stock-brokers, who had met at Jonathan's Coffee House, in Change Alley, moved to Sweeting Alley, this building became known as "The Stock Exchange Coffee House"—the first use of the phrase "stock exchange." 1802: New stock exchange building opened on Bartholomew Lane; members of the exchange totaled 500.

FOREIGN TRADE. 1760-1830 British foreign trade soared.

BRITISH TRADE EXPANSION
(in millions £ and U.S. \$ equivs.)

Year	Imports		Domestic Exports		Re-exports	
	(£)	(\$)	(£)	(\$)	(£)	(\$)
1760	9.8	49.0	11.0	55.0	3.7	18.5
1800	17.8	173.0	12.0	60.0	4.8	24.0
1830	55.9	279.5	38.3	191.5	5.6	28.0

By 1815 British foreign trade was the largest in the world. Tea, sugar, rice, and tobacco were key imports and were not only for the rich but also for the lower classes. 1760: 2.5 million pounds of cotton imported; 1800: 56 million pounds; 1830: 264 million pounds. Cotton became

the largest single import. Imports were mainly raw materials. Manufactured goods were the main export; of these, cotton yarn and cotton manufactures by 1830 comprised more than 50%. The slave trade was lucrative; 1783-93: Liverpool-registered ships carried more than 300,000

slaves—valued at £15,186,850—from the West Coast of Africa to the Western Hemisphere. 1807: Britain abolished the slave trade; smuggling, however, remained a source of revenue. The Napoleonic Wars curtailed certain trade. 1807: Jefferson's Embargo cut commerce with the U.S. In the face of these impediments the British resorted to smuggling, changed markets rapidly, and, when the Napoleonic Wars ended, Britain's trading connections and volume of trade were broader and larger than before. The growth of the cotton textile industry contributed importantly to trade expansion; likewise, freer commerce encouraged more commerce. The age of the great trading companies—with monopoly privileges—was closing. 1793: under its renewed charter, the English East India Co. was required to let certain private merchants trade in India. 1813: Act, renewing East India Co.'s charter, opened Indian trade completely. 1821: End of Co. of Merchants Trading with Africa. 1825: Dissolution of the Levant Co., which had had trading privileges with Mediterranean countries. 1835: Act terminated East India Co.'s monopoly in China and provided that after 22 Apr., 1834, the company should close its commercial business in India. By the early 1830's, with few exceptions, exclusive privileges were annulled. 1824 ff.: William Huskisson (1770–1830), president of the Board of Trade, sponsored measures rationalizing the customs legislation, reducing import duties on manufactured goods, eliminating or lowering import tariffs on raw materials, removing prohibitions on imports, and cutting out bounties and most restrictions on exports. Parliament liberalized the Navigation Acts (which had given preferential treatment to British shipping). 1824 ff.: Britain made a series of treaties, putting foreign ships on an equal basis with British ships in British ports. The expansion in international trade was essential to British economic growth, providing accumulated capital for industrial growth, encouraging the modernization of transportation, aiding the emergence of financial intermediaries, giving access to raw materials, and, most

vital, offering a market for what new industries—especially the textile industry—produced. Foreign trade stimulated the development of the port cities of London, Hull, Newcastle, Bristol, and Liverpool. Foreign trade assisted in the creation of a business environment with values conducive to profit making. It widened the vision of participants.

FOREIGN INVESTMENT. British foreign investments were made by large trading cos.; there were British investments in sugar plantations in the West Indies. Foreign governments floated loans in London; Britishers bought U.S. federal and state securities after the American Revolution. During the wars of 1793–1815 British capital went to Europe as loans or subsidies to allies. British capital financed American trade. From 1806 British moneys went into South American investments. 1815 ff.: Operating through the Barings, Rothschilds, and others, British investors were active in French *rentes*. After the Napoleonic Wars, London replaced Amsterdam as the dominant city in international capital markets. Britain became a creditor nation.

BUSINESS ORGANIZATION. 1720: As a result of the South Sea Bubble, British law passed, requiring all joint-stock cos. to be incorporated by Act of Parliament or chartered by the crown. Cumbersome procedure retarded the use of the joint-stock co. form. The industrialist in Britain was usually an entrepreneur, who employed his own money and skills; he might get others to lend him funds or go into association with friends. He used personal contacts to raise funds. He reinvested profits earned for purposes of expansion. While he devised new forms of business organization, integrating processes of production and marketing, he did not act through the media of the corporate form. Even after 1825, when the 1720 Act was repealed, the corporate form was not associated with industrial investments. Since it was possible to establish joint-stock enterprises by private act before 1825 and without one after 1825, canal, dock, bridge, road, insurance, and banking cos. (which needed to mobilize large

amounts of money) did take this form; they had continuity of life, transferable shares, and by the end of the 18th cent. some had even arranged limited liability for their members.

GOVERNMENT POLICY. The role of government in the British Industrial Revolution was one of providing a favorable environment. A series of strong kings had unified the English state; there was a stable political structure, a common law, internal free trade, and patent protection for inventors. 1800: Parliament made it generally illegal for workers to combine to increase wages or reduce hours of work. 1811-12: The Luddite riots (workmen breaking machines) were countered by Parliament in 1812, legislating that machine destruction was a capital felony. Government action in eliminating monopolies cleared the path for the expansion of manufacturing and trade. The government's role was to avoid entanglement in the economic system.

OTHER FACTORS CONDUCTIVE TO INDUSTRIALIZATION. 1776: Publication of Adam Smith, *The Wealth of Nations*: expression of sentiment that a nation's resources should be developed without government direction; monopo-

lies at home and abroad should be abolished; trade should be free. Nonconformity in religion in England aided the industrialization process; hard work was not discouraged; thrift was a virtue. The general interest in the nation in science and engineering—whether applied to agriculture or industry—provided a favorable environment for change. England was the leader in scientific inquiry. Innovation was not rejected; innovation was based on new products, new markets, new forms of organization, new sources of raw materials, as well as new production methods. There was the opportunity for an entrepreneur to rise on the basis of his own merits.

THE BUSINESS CYCLE. The first Industrial Revolution took its course through war and sharp oscillations in the business cycle. The American Revolution did not sever America's economic ties with Britain, or retard the change. The Napoleonic Wars aided British prosperity, but with the temporary cessation of hostilities in 1801 there was a depression and in 1811 a deep depression. 1815 witnessed another downturn and not until 1821 was there a slow revival; 1831: recession.

The Beginnings of Sustained Industrialization—U.S. and Western Europe

During 1760-1830 the beginnings of sustained industrialization were evident in the U.S. and in parts of Western Europe. The lead was taken by the U.S., France, and Belgium, while Italy, the German states, Switzerland, Austria, and the Netherlands also showed some signs of change. In the U.S. and in these parts of Europe—as everywhere around the world except in England—agriculture employed the most men and contributed more than any other sector to national income.

AGRICULTURE AND ANIMAL HUSBANDRY. Agricultural improvements: In the U.S. and Europe, British agricultural improvements combined with

indigenous innovation. In the U.S., agriculture ranged from small farms in New England to larger farms in the Midwest to plantations in the South. The most dramatic change in American agriculture was due to Eli Whitney's cotton gin, 1793, which provided a basis for the southern 1-crop economy. The U.S. was in the forefront in the invention and application of new farm machinery. 1797: Charles Newbold patented America's 1st cast-iron plow; it did not win popular acceptance. 1819: Jethro Wood (1774-1834) perfected a 3-piece cast-iron plow with standardized interchangeable parts, which became the most widely used plow in northern farm-

ing. With labor shortages and with the high cost of labor, northern farmers were receptive to improvements in agriculture that economized on men. In the South, owing to the cotton economy, slave labor increasingly replaced free labor; mechanization was not widely used. Because there was an abundance of land, Americans paid little attention to conservation, use of fertilizers, or methods involving better utilization of existing lands. The open frontier meant that new land could come under cultivation and the old could be abandoned. On the European Continent progress in agricultural innovation took place more slowly. There was in Western Europe much more interest in British agricultural methods than in the U.S. Crop rotation was adopted by forward-looking landowners on the Continent at the end of the 18th and beginning of the 19th cent.; but side by side, old systems of agriculture prevailed. Flanders and Brabant led in intensive scientific farming. In Germany, in the Palatinate, Rhineland, Baden, Nassau, and in the area near Erfurt, Wurzburg, and Augsburg, farming was well advanced. This was also true in Alsace. In Holland, France, Germany, and Sweden marsh- and grassland were reclaimed and put under the plow. In Western Europe more land was put under cultivation. Mechanization of agriculture, occurring in England and the U.S., was slow to take place in Western Europe because of the presence of small landholdings and tenant farming. In some areas in France, grain was still trodden out by oxen as it had been for centuries. Many French landlords, unlike their British counterparts, found attention to the details of scientific agriculture beneath their dignity; French peasants because of their poverty could not afford scientific agriculture.

New crops: Cotton output, after the cotton gin, expanded rapidly in the U.S.

U.S. COTTON OUTPUT
(000 bales)

1790-91	9
1800-01	211
1810-11	269
1820-21	647
1830-31	987

The potato became an important food crop in much of Western and Central Europe. New fodder crops were cultivated. At the turn of the century the sugar beet was introduced in France.

Land reform: America had no peasant economy and no "traditional" medieval landownership structure. Vestiges of the feudal forms that did exist were eliminated: 1779, Virginia and Pennsylvania; 1786, New York abolished quitrents (payments of rents by settlers). 1776: Virginia ended entail, which had made land inalienable; other states followed. 1777: Georgia eliminated primogeniture, which passed land to the eldest son; other states followed. 1777: Confiscation of Loyalist estates broke up large landholdings. Land Acts of 1785, 1796, 1800, 1804, and 1820 set the terms of sale of western land and opened the way to new settlement and cultivation. In the American South, the size of landholdings grew, as plantations became the means of growing cotton. Land reform in Western Europe involved a sharp change in the traditional pattern. In the 18th cent. French peasants had been tenants under the feudal system 1789-93: French Revolution freed peasant from his dues and services. Unlike in England, where land reform transformed the peasant into a wage laborer, in France the peasant became a landowner. The French armies during the Revolutionary and Napoleonic period brought French ideas of land reform to Belgium, the Netherlands, Germany, Italy, and Austria-Hungary. 1795-1814: Seigneurial dues were terminated in Belgium and the Netherlands; many peasants became landowners. 1798: French abolished feudalism on the left bank of the Rhine and from 1804 sold property of the church and the emigrés to the peasants. In French-dominated Westphalia and the Grand Duchy of Berg, certain obligations of the peasants to the lord were abolished. In western Germany, as the feudal system was eliminated, peasants became landowners; but in many parts of Germany west of the Elbe, the traditional structure prevailed; 1783: emancipation of serfs in Baden; 1807-9: Baron von Stein (1757-1831) of Prussia freed the serfs; 1808: his edict per-

mitted trade in land and consolidation of holdings; 1811: Karl August von Hardenberg (1750-1822) of Prussia gave peasants the right to become full proprietors, but this edict and a subsequent one, 1816, made it virtually impossible for a peasant to obtain full title without selling some of his land to the lord. Thus there occurred the formation of large landholdings by the Junkers in Prussian territory east of the Elbe. 1808: Serfs emancipated in Bavaria, in Hesse, 1811; in Wurttemberg, 1819. 1808-9: The French extended land reforms to Italy; peasants got clear title to land, estates of religious orders were seized and sold, and seigneurial obligations were abolished. 1815 ff.: After the overthrow of Napoleon, the manorial system in Italy ended. In northern Italy peasant farming and large farm units remained, whereas in the south large landholdings (*latifundia*) prevailed, worked largely by hired hands and sharecroppers. 1760's and 1770's: Under Maria Theresa, queen of Bohemia and Hungary, archduchess of Austria, etc., new codes fixed the dues and services of the peasant and number of days of labor service (*robot*) required of him, the peasant was given greater freedom. 1781: Joseph II ended serfdom in Austria, 1782: law extended to Galicia; 1783, Transylvania, and 1785, similar decree issued for Hungary. Reforms by Joseph II, which aimed to replace large landed estates with small peasants' farms, were not successful; the reform movement collapsed because of landlord opposition. 1789, 10 Feb.: Joseph II issued a famous agrarian reform decree which was later withdrawn because of landlord opposition; the peasant remained subject to the lord of the manor. In Denmark enclosure of common lands took place. 1682, 1725, 1769, 1791: Royal government ordinances protected the peasant and secured for the cottager, who lost his rights to common land, sufficient land to keep a cow and pigs. Agrarian reform in Denmark created a nation of peasant owners. In southern Sweden peasants obtained titles to their land.

Productivity: In the U.S. agricultural productivity rose, as agriculture became increasingly efficient. 1789-1830: In France

there was little improvement in agricultural productivity. Small peasant ownership did not serve to raise output per man. Elsewhere in Europe, there is little evidence of significant increases in productivity.

Commercialization: American agriculture became commercial agriculture. Stimulated by rising American population as well as by the growth of urban areas in the East and export opportunities, most agricultural output went to market. In Western Europe the trend was to greater commercialization of agriculture. Commercialization was stimulated by rising population, growth of urban areas, ascending agricultural prices (c. 1755 to c. 1817), and improved transportation. Between 1817 and 1850 there was a decline in price levels, but changes that took place in earlier years were not reversed.

Effects of the changes: In the U.S. cotton became a major export crop, capable of aiding American economic development. In Western Europe, the changes in agriculture, which disrupted the old seigneurial land-tenure system, to some extent introduced labor mobility, thus creating preconditions for subsequent economic development. In the U.S. and in Western Europe, the level of agricultural activity was high enough that these countries could feed themselves; none depended on food imports for existence. Judged as a whole, the period 1760-1830 could be considered as a time of agricultural boom in both the U.S. and Western Europe.

RAW MATERIALS. The U.S. had vast areas of timber resources. 1776: roughly $\frac{1}{2}$ of the world's iron supply was produced in the U.S. Coal existed, but the coal industry did not. Total consumption of anthracite coal in the U.S. in 1828 was less than 100,000 tons. (Charcoal rather than coal served as the basic fuel.) The resources of the U.S. were vast, but were unknown and undeveloped. France had large timber resources, which were dwindling as charcoal consumption rose. In Western Europe, the coal and iron region stretched from the British Isles across the English Channel to Scandinavia and Up-

per Silesia. Sweden had important iron-ore resources, as did Germany and France. France, while it held Belgium (1797–1815), had access to its coal resources. 1800: Belgian coal mining was the most important on the Continent, located at Mons, Charleroi, and Liège. 1800–1830: Belgian coal-mining industry expanded rapidly. 1815 ff.: France's own supplies of coal were inadequate. 1815 ff.: The coal mines of the Ruhr in Germany began to be worked effectively.

LABOR. In the U.S. labor was scarce. Population rose from 1.6 million in 1760 to 12.9 million in 1830, but this still was inadequate. There was a high land-man ratio. Compared with Europe, labor in the U.S. was expensive; this encouraged mechanization and technological advance. In Western Europe, population was also rising, but not as dramatically. France's population rose from 26.9 million in 1801 to 31.8 million in 1831. At the end of the 18th cent., there was abundant cheap labor on the Continent, which may have slowed technological advance. The population of the U.S. was basically rural; in 1800 only 6 cities had populations over 8,000 (Philadelphia, New York, Baltimore, Boston, Charleston, and Salem); France's population was also rural, but in 1801 there were 90 cities with populations over 10,000; in Europe, Paris was 2nd only to London as the largest city. Increasing urbanization occurred in both the U.S. and France; this was less true elsewhere in Europe. In the U.S., compared with Europe, labor was mobile. The freeing of the serf in Prussia, other German states, and Austria increased mobility, but when in the elimination of feudal levies the peasant became an owner of land (as in France), this often reduced the mobility. As the guild system was eliminated in Western Europe, this encouraged labor mobility. In the U.S., Americans were tinkers out of need; slowly they developed industrial skills; American education, especially in New England, was good; literacy was high. France took the leadership in civil engineering and mining schools (1747: *École des Ponts et Chaussées* and 1794: *École Polytechnique* were founded); but sec-

ondary education and beyond were available only to an elite; elementary education was poor; there was no compulsory system of schooling. 1821: 25,000 communes had no schools of any sort; the majority of the French population was illiterate. The rest of Europe was also lacking in mass education and industrial skills.

ENERGY. Water, wind, and domestic animals were the main sources of power in the U.S. and on the European Continent. The small mill and factory on the small stream were typical in the 13 American colonies and then in the U.S. As late as 1815, horse- or ox-pulled winches were typically used in powering cotton mills in France. 1820–1830: Water power was the usual source of energy for cotton mills in France; industry on the Continent mainly used water power. Steam-power developments in England had impact in the U.S. and on the Continent. 1801: Oliver Evans (1755–1819) built a small, stationary high-pressure steam engine; 1803: he established a shop to manufacture that engine, Mars Iron Works, which marked the beginnings of commercial production in the U.S.; Evans' high-pressure engine was simple, powerful, and cheap; it quickly replaced the imported Boulton-Watt engine for use in American industry. In the U.S. steam came to be employed where water power was not readily obtainable and also in such industries as glass manufacture, bleacheries, and print works, where heat was needed; by 1830, industries in the Middle States were adopting steam power (57 out of the 161 plants in Pennsylvania used steam), while New England still depended on water power. (Only 4 out of 132 Rhode Island textile mills used steam.) On the European Continent, Belgium was most receptive to the adoption of steam power; it was tied in with the mining industry, cotton textiles, and the engineering industry. 1784: Le Creusot iron works in France used a steam engine as motive power for hammers of the forge, for pumping in the mines, and blowing the furnace. 1812: Steam introduced into cotton mills in Alsace, by 1817 in Lille, and in a woolen mill at Louviers; 1817–20: steam em-

ployed in cotton-spinning mills of Rouen; 1818: between 150 and 200 steam engines in operation in France, half imported from England. 1819 ff.: Most steam engines were made in France, because of high tariffs. 1830: 625 French establishments possessed steam engines. The German states did not adopt steam power readily; by 1800 only a few Newcomen machines and a few Watt engines were in use, mainly for mining operations. 1812: Freund was 1st Berliner to make a steam engine; 1832: only 30 steam engines in Berlin.

INDUSTRIES AND TECHNOLOGICAL ADVANCE. 1760's: In the American colonies, there was a thriving shipbuilding industry (1760: $\frac{1}{3}$ of total British tonnage was colonial-built). Other manufacturing included household products, leather goods, and hats; weaving and shoe-making were done in the home. Mills and factories included lumber, flour, paper mills, and glass manufactories; there were breweries (in New York and Pennsylvania) and sugar refineries (in Pennsylvania); local furnaces and forges produced iron. On the European Continent as in America there existed artisan industries; in Europe, textiles were made everywhere—in France, Switzerland, Italy, Germany, the Low Countries, and in the Hapsburg Empire; local furnaces and forges produced iron. By the end of the 18th cent. France and Italy had glass, paper, metal-working, and sugar-refining industries. 1780–1830: Spread of British technology, despite British legislation prohibiting emigration of mechanics (until 1825) and prohibiting export of drawings, models, or specifications of textile machinery, or the machinery itself (until 1842); Americans, Germans, French, and Belgians learned from the British. In the U.S. and on the Continent, British machinery and workmen aided the diffusion of British methods; British technology meshed with indigenous innovations.

Textiles: 1789: Samuel Slater (1768–1835) came to America; he transferred by memory designs of the spinning frame in Richard Arkwright's and Jedediah Strutt's works in England; he began to build spinning machinery in Pawtucket, R.I.; 1790,

5 Apr.: Slater became partner in firm of Almy & Brown; 20 Dec: spinning began, the 1st spun cotton by power in the U.S. 1793: John and Arthur Scholfield arrived from England; they introduced British methods of wool carding and reduced from hours to minutes the time required to prepare wool fibers before spinning. 1813: Boston Manufacturing Co. was established at Waltham, Mass.—the 1st textile factory to conduct all operations under a single roof, converting with power-driven machinery cotton into cloth (the 'Waltham System'); its technology was American rather than British. 1816: American William Gilmour introduced a successful crank-type loom in Rhode Island; Ira Draper, in Massachusetts, patented self-acting loom temples for holding and guiding cloth during weaving. 1823: 1823: Asa Arnold's compound gear for changing velocity for winding cotton filaments; 1828: Charles Danforth invented cap spinner for improving weft; John Thorp invented ring spinning process. By 1830, in the wool industry, America was using power looms (Here the U.S. was in advance of Great Britain.) On the Continent, Irish engineer John Holker settled in Normandy, France, and introduced British techniques. 1798: Lancashire mechanic William Cockerill made textiles machines at Verviers and later at Liège. C. 1800: The flying shuttle was widely adopted in the French cotton industry; a Scotsman, Norman Douglas, who understood wool carding and spinning machinery, founded a workshop on an island in the Seine (financed by French capital); Hargreaves' spinning jenny was accepted in France; jennies were being used in Alsace. 1803. 1801: Frenchman Joseph Marie Jacquard (1752–1834) exhibited at a Paris industrial exhibition a loom he had invented for weaving figured fabrics. Earlier, Frenchman Jacques de Vaucanson (1709–82) invented a loom; Jacquard saw it in 1803, and incorporated Vaucanson's methods to improve the Jacquard loom. 1823: In the vicinity of Mulhouse, France, experiments began with power looms; by 1830, 2,000 in use. 1830: France was 2nd only to England in world cotton spindleage, but produced only about $\frac{1}{4}$

as much cotton as Great Britain. (U.S. was in 3rd place in world spindleage.) 1794: 1st German cotton-spinning mill using Arkwright water frame established; progress in German cotton textiles was slow; what cotton textile activity did develop was in the Rhenish provinces at Krefeld and Elberfeld and in Saxony. 1801: In Belgium, a modern cotton textile industry began to develop at Ghent.

Iron industry: By the time of the American Revolution, 1776, there were ironworks in every colony except Georgia and more forges and blast furnaces in the colonies than in England and Wales combined; their output was smaller than that of British industry. 1816: Welsh ironworker Thomas C. Lewis introduced Cort's puddling and rolling processes to American industry. Technical innovation in the U.S. took a different pattern from Britain; in the U.S. the pattern was puddling, rolling, and then utilization of coal. The European Continent followed the British order: coal, puddling, rolling. 1782: At Le Creusot in France 1st blast furnace on the Continent to use coke. Because France lacked good coking coal, progress using coke was slow. 1791-92: 1st coke blast iron was produced from charcoal furnace in royal manufactory at Malapan, Prussia; 1796: coke blast fur-

nace built in Upper Silesia, Germany; the Germans experimented with puddling in 1825; c. 1810: Friedrich Krupp (1787-1826) purchased a small forge in Essen, Germany, and tried to manufacture cast steel; 1815: he put his product on the market without success. 1821: John Cockerill built the 1st coke blast furnace in Belgium.

Factory production: American innovations were in labor-saving devices. 1782 ff.: Oliver Evans created an automated flour mill. (1780's: LeBlanc in France used interchangeable parts in production of firearms, but the system was not developed in France); 1798-1800: Eli Whitney developed a system of interchangeable parts in the manufacture of arms; 1799: Simeon North (1765-1852) of Connecticut also used interchangeable parts in manufacture of pistols. C. 1800: Manufacturing of nails standardized; cut rather than hand-wrought nails were an American innovation. 1807-12: Americans Eli Terry (1772-1852) and Seth Thomas (1785-1859) began to make clocks on the basis of machine-made interchangeable parts; 1825: Henry Burden (1791-1871) of Troy, N.Y., made railroad spikes by machine; 1826: Collins Co. was formed in Connecticut to mass produce axes.

IRON PRODUCTION
(000 tons)

Year	United Kingdom (long)	France (metric)	Germany (metric)	U.S. (long)	World Total (long)
1740	20	26	18	1	160
1790	68	40	30	30	280
1800	190	60	39	40	460
1810	250	85	45	55	620
1820	368	140	89	110	1,010
1830	677	220	118	180	1,590

Gas lighting: 1786: German Johann Georg Pickel, a pharmacologist, lit his laboratory with coal gas—the 1st known application of coal gas to lighting; 1799: German Wilhelm Lampadius did experimental gas lighting of the palace of the Elector of Saxony in Dresden; 1816: Baltimore was 1st American city to have gas lighting.

Other technological innovations: 1785: French chemist Berthollet invented method of bleaching cloth with chlorine. 1791-94: Frenchman Nicolas LeBlanc is credited with being the 1st to succeed in making artificial soda. 1794: Frenchman Claude Chappe (1763-1805) developed semaphore telegraph; the 1st line ran from Lille to Paris and the system spread

to other countries. 1799: Frenchman Louis Robert invented a machine to make a continuous web of paper. 1800: Italian Alessandro Volta (1745-1827) made 1st electric battery. 1803: Fourdrinier brothers in France invented papermaking machine. 1809: German Samuel Thomas Sommering invented 1st electric telegraph. 1819: Dane Hans Christian Orsted (1777-1851) discovered electromagnetism. 1820: Frenchman André Marie F. Ampère (1775-1836) applied the discovery of electromagnetism to the telegraph.

TRANSPORTATION. Roads: Often following Indian trails, roads had been built in the American colonial period, local roads were linked for long-distance travel; by 1776 an unpaved road extended from Boston, Mass., to Savannah, Ga. After the Revolution, U.S. turnpike companies were formed to build toll roads, by 1810, thousands of such turnpike companies existed. 1820: all major cities in the eastern and northern states were connected by surfaced roads; after 1825, highway development by private cos. slackened; the roads reverted to state and local governments 1811-18: Construction of the Cumberland Road, a paved highway, linking Cumberland, Md., on the Potomac River, with Wheeling, W. Va., on the Ohio River, was financed by federal government funds. Horse-drawn wagons and carriages provided the traffic, 1800: American Oliver Evans ran a "steamer on wheels" through Philadelphia, but this did not inaugurate a new age. 1760: France and Italy had a network of Roman roads, some of which had been cared for, many of which were neglected. 1760-89: Road building accelerated in France based on administrative and strategic needs; great highways were constructed between important cities. During the Revolution, French roads were not maintained. 1799 ff.: Napoleon made attempts to build and repair roads; government funds were spent on routes linking Paris with Antwerp, Amsterdam, and Hamburg; with Metz and Mainz; and with Italy via Marseilles and Corniche, via Mont Cenis, and via the Simplon Pass; 1814: there were 16,300 miles of imperial roads; much of Napoleon's expenditures for roads lay outside what became

the permanent frontiers of France. 1815-30: roads in France fell into disrepair; only a few were improved. In Belgium and the Netherlands, main roads, paved with stone blocks, were reasonably good. German roads were poor, compared with those in France and the Low Countries. 1815: Prussia benefited by obtaining French-built roads in the Rhenish and Westphalian provinces. Transport was by horse-drawn carriages and wagons. 1769: Frenchman Nicolas Joseph Cugnot (1725-1804) built the world's 1st steam-propelled wagon; it was not developed commercially.

Inland waterways: In America, rivers often provided the best commercial routes. Sailing vessels went up the Mississippi, James, Potomac, Delaware, Hudson, and Connecticut rivers; rafts and flatboats were used to transport produce; where these were not suitable there was an early incentive to apply steam transport 1787: John Fitch (1743-98) ran 1st U.S. steamboat up the Delaware River; James Rumsey (1743-92) ran his steamboat on the Potomac River. 1807: Robert Fulton's (1765-1815) *Clermont* was 1st successful U.S.-built steamboat; it was demonstrated on the Hudson River. 1813: John Stevens (1749-1838) built 1st ironclad steamboat; 1815-60: the "golden age" of river steamboats. 1816: Steam navigation began on Lake Ontario—and later spread to other lakes. 1819. The American steamship, *Savannah*, crossed the Atlantic. France had many rivers, but some (Loire and Garonne) were irregular in flow; others (the Rhone, for instance) flowed too swiftly; many were too shallow; navigation was not easy. Elsewhere in Western Europe, rivers provided an important form of transportation. 1783: Marquis Jouffroy d'Abbans (1751-1832) operated the 1st paddle-wheel steamboat on the Saône River. 1821: Steam used on the Calais packets. 1820's: France was slow in adopting river steamers. Before 1825, steam services existed in Danish waters, from Stockholm to St. Petersburg, on the Rhine, and on Swiss lakes.

Canals: 1792-96: 1st canal in U.S. was built at South Hadley, Mass.; by 1800 in the U.S. a handful of successful canals had

been built; 1816: about 100 miles of canals existed; 1817: New York state legislature authorized the Erie Canal, a 364-mile canal from Albany to Buffalo, through unsettled country; 1825: canal was completed. Its success triggered a canal-building effort in the U.S., similar to that which had occurred in England after the completion of the Bridgewater Canal. By 1830 total canal mileage in U.S. reached 1,277 miles. Canal construction in Europe had a far longer history. In the Netherlands and Belgium canals had existed for centuries; they were kept in repair; France had started its modern canal system in the early 17th cent.; by 1830 total canal mileage in France was 1,260 miles. Germany was slower in building canals; 1772-75: Bromberg Canal linked the Oder and Vistula rivers.

Tramways and railroads: 1795: Boston Brick Works built 1st U.S. tramway; others carrying freight followed, powered by gravity, horses, mules, or cable attached to fixed engines. 1829: Delaware and Hudson Canal Co. imported 2 English steam locomotives for its new railroad; they proved too heavy and were abandoned. 1830: The Baltimore & Ohio Railroad, the 1st common carrier (carrying both passengers and freight) in the U.S., began operations; it used steam locomotion; the engines were made in New York. The American "railroad age" had begun. 1830: 23 miles of railroads operated in the U.S. There was not a single railroad in operation on the European Continent using steam locomotion.

FINANCE. Sources of capital: In colonial America and in the early history of the American Republic, capital was accumulated mainly through trade and through investments in land. British capital financed trade and to a small extent invested in America. In Europe mercantile capital provided the largest basis for surpluses. 1801: France was the wealthiest nation in the world (in terms of total—not per capita—national income); its net national product in 1801 was £288 million compared with Great Britain's gross national income of £232 million. Yet much of France's resources were devoted to

unproductive use: loans to the state, upkeep of the court and government bureaucracy, and war expenditures.

Financial intermediaries: These developed in the U.S. only after independence. 1781: Bank of North America was founded. 1784: Bank of New York and Massachusetts' Bank of Boston were established. 1791: Bank of the United States was organized as a central bank (not rechartered in 1811). 1816: 2nd National Bank of the United States was chartered (1832: recharter vetoed by President Andrew Jackson; 1836: expiration of charter of 2nd Bank). 1817: 1st savings bank in the U.S. was founded in New York. On the European Continent, banking institutions had a long history. 1609: Bank of Amsterdam was founded (collapsed 1791). Amsterdam was Europe's financial center until it lost its position to England during the Napoleonic Wars; 1814: Netherlands Bank formed; it could control issue of paper currency as well as perform other banking activities. 1619: Hamburg Bank founded (survived until 1875). 1656: Bank of Stockholm established (closed in 1664; refounded 1668 as Bank of Sweden and still exists). 1716: French bank established by John Law (failed in 1720); 1776: Caisse d'Escompte formed (modeled on Bank of England); it had unfortunate history; 1800, 13 Feb.: establishment of Bank of France; 1817 ff.: France set up a number of independent note-issuing banks; 1818: 1st savings bank in France. 1736-1816: Banks to finance the Danish, Prussian, and Austrian governments came into existence. 1736: Courant Bank of Denmark; 1765: Royal Exchange and Loan Bank of Berlin (became the Prussian Bank in 1846); 1816: the Austrian National Bank. 1760's: Meyer Amschel Rothschild (1743-1812) founded the House of Rothschild in Frankfurt. The Hopes, Parish, Bleichröder, and Mallet Frères in Amsterdam, Hamburg, Berlin, and Paris respectively were important private bankers. 1822: Société Générale pour Favoriser l'Industrie Nationale was founded in Brussels; a milestone in continental banking, it combined commercial and investment bank-

ing operations, granted loans on current account, discounted commercial paper, accepted drafts, and entered into long-term industrial financing. Despite these many banking activities, banking on the European Continent lagged behind that in Great Britain. While most of Europe was part of a monetary society (some peasants were not), banking facilities did not yet reflect this.

Stock exchanges: 1791: A group of Philadelphia traders organized the 1st stock exchange in the U.S. 1792: A group of 24 curb brokers in New York signed an agreement on methods to be followed in trading stock on Wall Street; 1817: these stockbrokers drafted the constitution and rules of the New York Stock Exchange. In Europe the Amsterdam stock exchange was founded in the early 17th cent.; it held the dominant position in Europe; 1795: it almost completely collapsed when the French conquered Holland. 1724: Stock exchange founded in Paris; it stopped operations during the French Revolution, reopened under the Directory, and was reorganized by Napoleon; 1815: stock exchange listed only government securities. France was far behind England in developing a capital market. Berlin and Frankfurt also had stock exchanges.

FOREIGN TRADE. American trade expanded, despite setbacks immediately after the Revolution and after Jefferson's 1807 Embargo. Imports were mainly manufactured goods; exports were mainly raw materials. After 1793 raw cotton became an important U.S. export, after 1803 the most important single export. The slave trade had been profitable for New England merchants; after it became illegal considerable illicit trade continued. In the colonial period, American trade had been mainly with England and the West Indies ("triangular trade"); 1776 ff.: trade became more diversified; 1784: U.S. entered profitable Canton trade with voyage of the *Empress of China*. By 1830, U.S. imports were \$71 million; exports, \$74 million; U.S. was in 3rd place after Britain and France in foreign trade. 1787: French foreign trade totaled livres 1,153.5 m., or \$230 m.; it was greater than British foreign

trade. During the Napoleonic Wars, Napoleon hoped for commercial strangulation of Britain by excluding her goods from Europe—the "Continental System." By 1809 he had closed all European ports except those in Turkey, Sicily, and Portugal to British commerce. The Continental System failed; British goods reached Continental Europe through the Greek islands, Malta, the Channel Islands, and Helgoland. Napoleon himself violated the System, clothing his army in Lancashire cloth, selling licenses which exempted traders from the decrees, and attempting to attract profits away from the smugglers. France did not develop her trade and dropped to a position below Britain. 1830: French foreign trade totalled \$181 million. The Netherlands, which had a flourishing international trade in the 17th cent., was by the end of the 18th cent. in a poor position. 1782: Dutch East India Co. (founded in 1602) paid its last dividend; 1798: Co. was dissolved; 1792–1820: European nations outlawed the African slave trade, though slaving continued illegally until after the U.S. Civil War, when it dropped sharply.

BUSINESS ORGANIZATION. Structure: In colonial America business organization consisted of family industries (within the household), domestic or "putting-out" systems in textiles and shoemaking (a merchant brought raw materials to the producer; the producer made the product in his home; the merchant marketed it), and mills and factories (usually owned by individual entrepreneurs or their families or partnerships). Trading firms were usually family enterprises. 1776 ff.: manufacturing increasingly went out of the home into the factory.

Guilds: No guilds barred development of business activity in the U.S. 1760: On the Continent, guilds still impeded business enterprise; with the abolition of guilds in France, 1791, ideas on freer enterprise spread with French military might to the Low Countries, western Germany, and Italy. Tuscany, 1770, Sicily, 1786, Lombardy, 1787, and Naples, 1821, abolished guilds. This gave entrepreneurs the possibility of entering into key trades. Private business enterprises in

France, the Low Countries, Germany, and Italy tended to be family units; they sought high profits at the expense of low volume, quality rather than quantity, traditional patterns rather than innovation, security rather than risk-taking.

Adoption of corporate form: In the U.S. manufacturing enterprises were in general unincorporated. Corporations did spread rapidly for use in internal improvements (turnpikes, bridges, canals, etc.), insurance, and banking; in the U.S. the use of the corporate form was more important than in Britain or on the Continent. The French, suspicious of the joint-stock co. form, avoided it, and permission to incorporate was difficult to obtain; up to 1830 there were fewer than 150 *sociétés anonymes* created in France. In Belgium industrial enterprise tended to be unincorporated. 1819: The insurance company *Securitas* was Belgium's 1st 19th-cent. *société anonyme*. 1822: The *société générale* took this form. In Germany, joint-stock cos., if formed at all, were by special charter; it was not a form much used. This was also true in Italy.

Entrepreneurs: Important early American entrepreneurs included Henry William Stiegel (1729–85), ironmaster (after 1760) and glassware maker (after 1764); ironmakers Peter Hasenclever (1716–93), John Jacob Faesch (1729–99), and William Alexander ("Lord Stirling," 1726–83); merchants John Hancock (1737–93), Stephen Girard (1750–1831), John Jacob Astor (1763–1848), and John P. Cushing (1787–1862). 1801, 21 Apr.: founding papers and articles of incorporation executed in Paris for E. I. Du Pont de Nemours & Co. of Delaware, a company to manufacture military and sporting powder in the U.S. 1806: William Colgate founded a small business in New York to manufacture soap and candles. Among the key European entrepreneurs were the ironmakers: Krupp in Prussia, the Boignes brothers and François de Wendels and his brother in France, and John Cockerill in Belgium.

GOVERNMENT POLICIES. British government policies may have aided economic development in the American colonies; British mercantilism—furnish-

ing preferential markets and protection for shipping—assisted American foreign traders, although British restraints angered the merchants. The British saw the colonies as providers of raw materials and markets for the mother country; British policy was to discourage manufacturing in the colonies; manufacturing developed despite British attitudes rather than because of them. 1789: The U.S. Constitution gave Congress rights to pass laws in the fields of interstate commerce and foreign trade, coinage, weights and measures, contract and property, taxation, disposition of unsettled lands, transportation, and banking. The Constitution stipulated that states could not erect tariff barriers against one another, an essential prerequisite for the creation of a national market. In the early years of the republic, with tariff, patent, and banking legislation, laws for funding the national and states' debts (which established public credit) as well as aid to internal improvements, the U.S. federal government provided foundations for economic development. 1792: U.S. Congress authorized the creation of 2 national armories; subsidies were given to private business to make muskets, pistols, and rifles; these subsidies for national defense purposes were exceptional aids to industrial activity. State governments provided corporate charters to business enterprise; state and local governments in the U.S. promoted internal improvements and education. 1819, 2 Feb.: the *Dartmouth College Case* gave new security to corporate charters, and later aided business enterprise. 1760–1830: The governments in France, Prussia, and Austria were more involved in industrial activity than the U.S. government, they became direct investors in certain industries and also encouraged industrialization through patent legislation, financial aids to research, tax concessions, tariffs, monopoly rights, assurance of supplies and labor, technological aid (which the governments obtained for businesses from abroad), loans at low or no interest, and often outright subsidies. In Western Europe restraints on free enterprise came to be removed; there was clarification and codification of legislation. 1760 ff.: Re-

forms of Maria Theresa and Joseph II in the Austrian Empire were in the direction of cutting internal tariffs,⁶ 1789 ff.: France reduced barriers to trade; weights and measures were standardized, 1791: Loi le Chapelier abolished guilds in France with influence throughout Europe. 1807: Clauses in French Commercial Code set basis for co. laws of Belgium, Holland, Switzerland, Italy, and Spain; under the Code there was the joint-stock co., *société anonyme*, which might or might not have limited liability (according to its charter) and which was subject to government regulation, and the *sociétés en commandite*, which had sleeping partners (with limited liability) and active partners (with no limited liability) and which were not subjected to government supervision since they were not considered legally to be corporations. 1810-11: Prussia abolished guilds. 1819: Maassen tariff in Prussia removed internal barriers.

OTHER FACTORS. The "Protestant Ethic," endorsing thrift, hard work, and personal achievement played a role in American economic development. Americans had some interest in science, but their inventive spirit was more important. America was an "open" society; there

were few traditions, tremendous optimism, and new land for settlement. There was the opportunity for individual accomplishment. Success in the American Revolution and the War of 1812 gave the country a sense of optimism. France had many advantages helping her toward industrialization. The French had a tradition of interest in science; there was no absence of invention; what was lacking was the translation of science and invention into profitable opportunities. The French were still fettered by traditional attitudes and values. The Napoleonic Wars also impeded French economic development, depriving the nation of men, capital, and raw materials. 1815: Loss of the French conquests under Napoleon cut off Piedmont, Lombardy, Rhenish Prussia, and Belgium from France, all of which had contributed to French industry; the settlement left an aura of defeat. Lack of political independence may have slowed Belgian development. 1815 ff.: Germany consisted of 38 sovereign states; the political divisions hindered the development of a common market; traditional political and economic patterns continued, despite the changes caused by the French impact, 1790-1815.

The Nonindustrial World

During the period 1760-1830 most of the world's economy was nonindustrial. Nonindustrial societies were heterogeneous. There were areas of western tradition (Eastern Europe, parts of Russia, Spain, and Portugal), of western impact (from Canada, Australia, and New Zealand to Latin America, the West Coast of Africa, and South Africa to the Ottoman Empire, India, Malaya, Java), of eastern tradition (China and Japan), and societies of technologically primitive nonliterate (e.g., North American Indians, Australian aborigines, nomads of the Middle East, Central Asia, Southeast Asia, etc.).

Securing food took priority over other forms of economic activity. Wants were related to survival. In practically all the nonindustrial world, agriculture was the

primary mode of existence, employing and supporting most of the population. Exceptions lay in primitive communities: certain North American Indian tribes, the Eskimos, the Bushmen of the Kalahari Desert in Southern Africa, the aborigines of the southeastern coastal lands of Australia, the Negritos, Semang, and Sakai of the Malay Peninsula, plus jungle tribes in Assam, Burma, and Siam; these peoples lived by hunting, plus in some instances fishing, and in all cases collecting wild roots and plants. Other exceptions were the "pastoral nomads"; they domesticated animals—camels, sheep, goats, cattle, or horses, they were present in North Africa, Arabia, Afghanistan, and southern Russia. In most of the world, however, agriculture was practiced.

AGRICULTURE AND ANIMAL HUSBANDRY. **Eastern and most of Southern Europe, Ireland:** There was little improvement in agricultural methods; innovations taking place in England were known but not applied; in Eastern Europe, the feudal manorial system persisted as did serfdom or the near equivalent, despite the reforms of Joseph II. In Russia the manorial system with serfdom remained unaltered. In Spain, large entailed landed estates prevailed, using low-paid wage labor or, more typically, sharecroppers. In Ireland tenant farming on a subsistence level was the main mode of cultivation.

Canada, Australia, and New Zealand: Two societies coexisted—that of the original peoples and of the immigrants. In Canada settlers rapidly outnumbered the Indian population. Cultivation of the land occurred and a timber industry developed. Lumbering proved a key by-product of general farming. 1788: 1st British settlement in Australia. 1796: 1st plow introduced in Australia by John McArthur of the New South Wales Corps; McArthur became an advocate of sheep breeding, and in 1813 sheep breeding in Australia began to be actively pursued. 1769–70: Capt. James Cook, visiting the islands of New Zealand, found cultivated land “laid out in square plantations.” 1826: New Zealand Co., founded in England, dispatched colonists to New Zealand, but these, unimpressed, migrated to Australia. The Maoris (natives of New Zealand) still outnumbered the immigrants; agriculture was primarily native cultivation. None of these “new” countries had the manorial system, serfdom, or the use of slave labor. White settlers had no “traditional agricultural society.” There was, moreover, land suitable for cultivation once exploration and transportation opened these regions. In Canada and Australia, changes in agriculture and animal husbandry involved innovations introduced by immigrants. In New Zealand, since Europeans were mainly traders, whalers, and missionaries, most of whom imported food, the effects on agriculture were as yet minimal.

Latin America and the West Indies: Native agriculture coexisted with 2 types of western agriculture. There were the “plantation colonies” in the tropics, where sugar, cotton, and indigo were raised for export; these were characterized by large landholdings and absentee proprietors; most used slave labor. The sugar plantations of the West Indies and of Brazil stand out in this category. Second, there were the “farm colonies” in the temperate zones, established by the Spaniards in Chile and Argentina and by the Portuguese in southern Brazil, and characterized by settlement and freehold land systems. In Jamaica, Barbados, and other British-controlled islands in the 18th cent., British owners had small farms for grazing and breeding animals. The sugar plantations of the West Indies were owned by Britons, Frenchmen, Danes, Dutchmen, and Spaniards and organized to supply the European Continent. In much of Spanish America, the land tenure pattern existing in Spain in the 16th cent. had been introduced—large manorial estates, cultivated by “peons”; entail prevented the dissolution of the estates, which passed generation by generation to eldest sons. Although the church favored the retention by Indians of their land held before the conquest, the church likewise became a large owner of property in Spanish America. By the time of independence, 1810 ff., giant estates in the “plantation colonies” and in the “farm colonies” on the mainland were owned by white or mestizo Latin Americans or ecclesiastical corporations. Landholdings by native villages still existed, but became increasingly less important. Concentration of land ownership, labor by slaves or poorly paid peons, inefficient use of the land (tillage of only part of the land area and primitive agriculture methods), retarded economic progress in Latin America. The political revolutions did not alter the structure of land tenure or the development of agriculture. 1824: Bernardino Rivadavia land law in province of Buenos Aires; 1826: extended to rest of Argentina. Contrary to its intentions, the land law fixed on Argentina the pattern of the

latifundia. In subsequent years, large tracts of public land passed into the hands of a few families.

Tropical Africa: Most European settlement in tropical Africa by 1830 was along the coast by merchants. 1817: French officials in Senegal attempted to develop agriculture; they attracted a small group of settlers, who started plantations, tried to grow indigo, sugar, coffee, and cotton, but found the crops not competitive with varieties grown in the West Indies. 1835: The colony of Senegal abandoned its plantations. Outside Senegal, almost all agriculture in tropical Africa was native agriculture; in most of Africa, where the soil permitted, cultivation was practiced. Often there was shifting cultivation: a rotation of farming sites in contrast to a rotation of crops; a group would burn to clear the land, cultivate for several years, and then move on to new land when the soil was exhausted. From the 16th cent., the Portuguese had introduced to West Africa from Latin America such food plants as maize, manioc, sweet potatoes, groundnuts (peanuts), papayas, cayenne pepper, tomatoes, and tobacco. These spread throughout tropical Africa. 1822: The Portuguese introduced cacao from South America to São Tomé; cultivation spread. 1820-30: Cloves were introduced from the Moluccas to the islands of Zanzibar and Pemba. Generally African crops were raised intermingled with one another. Agricultural organization revolved around the village. In some instances, the village "owned land" and in other cases the equivalent of private property existed. In parts of West Africa (for instance in Dahomey, in Hausaland, among the Ibos, etc.), cultivation was done in part by Africans using slave labor. Most agriculture in tropical Africa was on a subsistence basis, but in Hausaland and elsewhere some cash crops were produced. Palm oil became a cash crop in West Africa, but nowhere were specialized, commercial crops the norm. Because of the tsetse fly in much of the African tropics there were no animals for transport, manure, meat supplies, or milk. On the other hand, in parts of East Africa, cattle, sheep, and goats were of primary importance.

Southern Africa: Native agriculture co-existed with the farm communities of the Dutch and British colonists. The latter practiced European methods, while the former farmed in traditional fashion. 1810-11: Travelers to Cape Colony found the Hottentots cultivating vegetables, tobacco, and pumpkins; the Klaatwater Hottentots grew tobacco and used wild leaves for tea; in the early 19th cent. Europeans introduced the plow to the African tribes in the eastern district of the Cape.

Ottoman Empire: In Anatolia farm techniques remained what they had been for almost 1,000 years; village agriculture was on a subsistence basis. Cultivated areas in Iraq, Syria, and Arabia were fewer than in Roman or early Arab times. By the 18th cent. tobacco was being raised for export from Salonica, Syria, and Trebizond, but tobacco exports were still not substantial. Egyptian agricultural developments represented an exception. 1806-1811: Mohammed Ali (Muhammad 'Ali) (1769-1849), founder of modern Egypt, introduced land reforms: peasants were required to pay taxes to the government directly instead of to a landlord; he ordered a resurvey of cultivated land; the state acquired large landholdings on which taxes had not been paid or where title deeds were irregular; his followers or relatives were granted large estates; as a substitute for communal ownership, peasants were given *de facto*—not yet legal—ownership of land. New crops were introduced, including cotton, rice, and maize. 1821: Planting of long-staple cotton began in Egypt on a commercial scale. 1820's: Cotton replaced grain as Egypt's chief export. Agriculture in Egypt became more efficient.

India: Agriculture was inefficient and precarious. The soil suffered from exhaustion after centuries of cultivation. Famines followed droughts 1769 and 1790-92: Widespread famines swept through India, made worse through soil deterioration and overpopulation. Indians cultivated small plots, barely adequate for subsistence. 1793: Lord Charles Cornwallis as gov. gen. of India made landlords of the zamindari (individuals recognized by the Moguls [Mughals] as responsible tax

collectors in the villages). The zamindari were to pay the same amount to the government each year (and not have periodic reassessments). Cornwallis hoped the zamindari, with an eye to raising their own incomes, would encourage agricultural improvements (like contemporary English landlords). The system, mainly in operation in Bengal, was not effective. 1812: In southern Madras, the tax payments were fixed for each individual cultivator (ryot) and were to be paid by the occupier of the land to the government (the ryotwari settlement); these arrangements, unlike the permanent settlements with the zamindari, were temporary and subject to reassessments. C. 1818: In Bombay Presidency the peasant was not made an owner (as in Madras) but was given "rights" to his estate; assessments were temporary. The British created a revolution in land tenure in India; throughout the area they ruled, they demanded payment in money and payment in full each year; they established a system of private property in land.

Ceylon: 1824: The 1st British plantation in the East was begun at Peradeniya; coffee was the product.

China: South Chinese farmers had constructed and maintained for centuries elaborate terracing and irrigation systems for wet-rice cultivation. Tea cultivation was widespread in south China. In northern China wheat was the major crop. Throughout China subsistence agriculture predominated; peasants were using iron plows, however crude the wrought iron, while in Europe many peasants still used wooden plows; there were thousands of small isolated villages; Chinese agriculture was commercialized to a certain extent; urban areas requiring foodstuffs meant the presence of a domestic market; tea was the key export crop, and it met with increasing demand in England. In China rising population meant peasants' farms were subdivided into small plots, often insufficient to keep a family alive in the poor seasons. Peasants had to borrow, which in turn led to dispossession from their land. C. 1775: Serious peasant rebellions began, becoming widespread in the following decades.

Japan: Technological (not mechanical) changes took place in Japanese agriculture, based not on western practice but on Japanese and Chinese experience. Miyazaki Ante's *Nogyo zensho*, 1698, was the 1st Japanese treatise on scientific agriculture and had influence throughout the Tokugawa period (to 1868). Other works followed, such as Okura Eijo's *Nogu Benron* (*On the Efficacy of Farm Implements*, c. 1768). Commercial fertilizers (dried fish, oil cakes) were widely used, supplementing the natural fertilizers. These raised crop yields and permitted more intensive use of land. There was improved use of seed varieties. In response to increasing urbanization in Japan in the 18th cent., quantities of grain, rice, fish, timber, and fibers were required to fill basic needs. Prior to urbanization, each region, village, and holding had produced for subsistence. Rice and lesser grains were staples. Each family grew a little fruit and some vegetables, and perhaps tobacco. By the beginning of the 19th cent. Conditions had changed. Except in especially remote, backward locales, peasants specialized according to the soil, climate, and price. Local markets supplied other needs. Cultivation of mulberries and raising of silkworms took place in the valleys of central Honshu, cotton in the same area, sugar cane in southern Kyushu and the islands in the south. Not all crops had become commercial; self-sufficient plots intermingled with cash crops. Much of the agricultural activity had come to involve wage labor. Owing to infanticide, the Japanese population seems to have remained approximately constant, which curbed the excessive subdivision of peasant farms typical of India and China.

Southeast Asia: Commercial agriculture commingled with village subsistence agriculture, with the latter predominant. Rice was the basic crop. In Burma, Siam, and Malaya European trading cos. (by their purchases) encouraged the commercialization of agriculture. The Philippine Islands, Java, and Sumatra also developed commercial agriculture. 1798: The Dutch East India Co. dissolved into bankruptcy and the Dutch government took control over the East Indies; the policy of the

Co. was continued: demands for pepper, coffee, indigo, cotton, and sugar, which were sold in Europe (the "forced delivery system"). Through controls over local rulers, the Dutch fixed prices and restricted trade but did not act directly. In the vicinity of Batavia, Co. employees had started hundreds of private sugar estates, the proprietors of which were Chinese. 1811: Thomas Stamford Raffles (British administrator) took over from the Dutch in Java. Raffles abolished the forced delivery system, hoping farmers would produce for a free market; he collected land taxes in money to encourage more commercialization. 1816: Java returned to the Dutch; they kept Raffles' method in part, but it did not work. Peasants preferred to grow the traditional crop, rice, and to borrow money for land tax payments rather than switch to the more profitable commercial crops. 1830. Raffles' system abandoned in favor of the "culture system."

RAW MATERIALS. Basic raw-material resources in the nonindustrial world were largely unknown and inaccessible. Russia's vast raw material supplies were in the main unconnected by transportation and undeveloped; there was, however, substantial iron-ore mining in Russia. Spain had iron resources and copper. By contrast the indigenes of New Zealand and Australia did not know how to make bronze or forge iron. The settlers in Australia had not yet uncovered that land's mineral resources, nor had the Canadian settlers in their land. Spain and Portugal in colonizing Latin America invested in mines to obtain precious metals. The colonizers extracted huge quantities of gold and silver from the mines of the New World. 1759-88: During the reign of Carlos II, nearly 500 million pesos in coin and bullion were imported from the American colonies into Spain. 1783: Carlos III promulgated a new mining code for New Spain, which in the next years extended to Venezuela, Guatemala, New Granada, Peru, and Chile. It served as the basic mining law for most of Spanish America until the late 19th cent.; it covered operations of mines, fiscal organization of the industry, regulation of

labor, trade in precious metals, banking and credits, technical training for mining engineers, etc. 1800: Spanish and Portuguese American mines were producing 90% of the world's precious metals. It was precious metals rather than industrial raw materials that were developed in Latin America. In most of Africa iron was known and used. Africans had worked the copper deposits in Central Africa and had smelted low-grade copper oxide ores. Gold had long been mined by Africans.

Ottoman Empire: Minerals were undeveloped. The Arab Middle East seemed to lack mineral resources.

Asia: The mining industry, although it had a long history, was still in its infancy; in India, gold, copper, and iron were mined but the volume was negligible. Chinese coal, iron, copper, tin, and silver resources had begun to be developed, but silver in circulation as currency came from the New World via Europe and the Philippines, in Japan, mining enterprises existed in gold, silver, and copper, operated by the shogun or by daimyo, coal was produced as was iron from iron sands, but on a small scale; in Southeast Asia, tin was mined on a small scale in the Red River Valley, the Malay Peninsula, and the islands to the south; iron and gold were mined in the Malay Peninsula; tin was mined on the island of Banka off eastern Sumatra. More important, industrial raw materials other than minerals that were developed in the nonindustrial world included cotton (in India, China, Japan, Egypt, etc.), hemp and jute (in Russia, India, Southeast Asia, and the Philippines), silk (in East Asia), and timber (in Eastern Europe, Russia, Canada, Manchuria, Japan, Korea, southern China, etc.). Massive development of mineral resources of underdeveloped countries awaited exploration, transportation, and capital-intensive investment. None was yet available.

LABOR. Much of Asia was heavily populated, with the population rising in China and India, and fairly stable in Japan. Elsewhere in the nonindustrial world the population was sparse. Australia was being newly settled by convicts transported from England plus some free

immigrants; Canada had a slow stream of immigration. In Latin America and Africa, there was no overpopulation, nor was this the case in the Dutch East Indies. Population in the nonindustrial countries was mainly in rural areas. Many Asian cities were large, but only 1% of the entire Asian population (excluding Russia) lived in urban areas. The cities, with their commercialized economies and their accumulations of wealth and also poverty, were in sharp contrast to the prevailing massive poverty of the vast rural areas. Large income differentiations existed throughout the nonindustrial world. With the partial exception of the new white settlers in Australia and Canada, for the most part the nonindustrial world was characterized by a highly structured traditional society; the structure of such societies varied dramatically, but status rather than contract everywhere prevailed; there was, with the exception of Japan, little labor mobility. In Eastern Europe and Russia, the presence of serfdom retarded economic progress. The caste system in India provided a strong bar to change. Slavery in much of the underdeveloped world also provided a block to progress. Abolition of slavery spread slowly: 1826: Chile abolished slavery; 1829: Mexico. Yet slavery remained in much of Latin America, Africa, the Arab world, the British Empire, and Southeast Asia, though its harshness and rigor varied very greatly. Throughout the underdeveloped world, with the exception of Japan, industrial skills and education were lacking; in Japan, industrial skills emerged in rural industries. In India, the British introduced a European educational system: 1813: the East India Co. was ordered to spend £10,000 per year to instruct Indians.

ENERGY. The basic energy resources throughout the nonindustrial world were human power and domestic animals. Wind and water power were used to a small extent.

MANUFACTURING. Manufacturing ranged from the whittled stick for digging to tools of stone, bone, or shell to decorations (necklaces, earrings) to clothing to household goods (pottery, matting, bags, and baskets, etc.) to weapons (clubs, bows

and arrows, etc.). Boats were manufactured. In most societies, metals were worked. Wood carvings and leather goods were typical manufactures. No matter how primitive a society, it had some sort of manufacturing. Even economies that were nonexchange societies had manufacturing. There were no known societies that did not have the use of fire, the use of a cutting instrument, or the use of string. Most manufacturing was within the household. In some few underdeveloped countries, factories, forges, and foundries were introduced (they were exceptional). In Russia, Eastern and most of Southern Europe, artisan manufacturing prevailed 1760: Russia was the world's largest producer of iron; in 1805, Russia's output fell below England's, after 1828, its production was lower than that of France or the U.S. Settlers in Australia and Canada manufactured basic household items; Canadian settlement was of longer duration, and there were an ironworks (at St. Maurice, Que.), shipbuilding, potash works, and a number of sawmills and gristmills; nevertheless, most of the colonists' requirements for manufactured goods were imported from England. New Spain and Peru, under Spanish rule, had cotton and woolen cloth industries; silver, leather goods, hardware, furniture, shoes, and handicrafts were manufactured; food-processing industries had developed; shipbuilding became important in Havana, Guayaquil, and Buenos Aires. Spain discouraged manufacturing in the New World colonies, but by 1800 the Spanish colonies had more extensive industry than their mother country, although the manufacturing was insignificant compared with Northern Europe or the U.S. 1811 ff.: In Argentina, under Rivadavia the state built a foundry for cannon, a powder factory, and a gun works. African manufactures consisted of bags, baskets, hats, nets, cloths, etc.; there were smiths, weavers, potters, woodworkers, ropemakers, and boatbuilders; simple utensils were produced, as were ornaments and weapons. In the Middle East handicraft industries had retrogressed from their level in earlier eras and were still retrogressing; artisan industry

in the Moslem (Muslim) world had a higher level of activity in 1760-1830 than after 1830, when European machine-made goods increasingly replaced the handmade products; within the Ottoman Empire cotton, silk, embroidery, Moroccan leather, and cutlery industries existed. In Egypt Mohammed Ali made attempts to start modern industry; 1818 ff.: machinery and technicians were imported into Egypt from Europe; the Egyptian government made direct investments in the factories, trained workers, and sought out raw materials and fuel; by 1830 modern cotton, woolen, silk, and linen textile mills, sugar refineries, glass and paper factories, as well as tanneries existed in Egypt plus a government armament plant complete with a foundry. Egyptian progress was exceptional for the less developed world. India, once a net exporter of manufactured cotton goods, was becoming, 1800-1830, a net importer of cotton goods; India's own handmade product could not compete with British machine-made goods. In China spinning, weaving, and printing cotton was a well-developed art since the 17th cent., an industry of craftsmen; a Chinese silk industry had also emerged. Chinese porcelain was world-renowned. Japan had well-developed rural industries, in cotton and silk and in crafts. In Java Chinese inhabitants made embroidery, dyed cotton, and were tailors, carpenters, joiners, and smiths. In New Zealand the Maoris made clothing from animal skins. In the South Pacific, clothing was manufactured from tree bark. The less developed world—with its range of manufactures and manufacturing methods—was characterized by a low level of technology by comparison with the West. In these years, not a technological innovation of worldwide consequence came from anywhere in the nonindustrial world.

TRANSPORTATION. In the non-industrial world, transportation facilities were poor.

Roads: In Eastern and Southern Europe roads were in disrepair. Road building in Canada and Australia was in its infancy. Rough trails were in evidence in much of Latin America, while footpaths characterized much of Africa and

Southeast Asia. In Egypt, under Mohammed Ali attempts were made to build modern roads. Japan had a road system.

• **Overland transport:** Human beings, using their hands, heads, backs, and shoulders (worldwide); mules, donkeys, and llamas (in Latin America); and camels, mules, donkeys, and less often horses (in the Middle East), were beasts of burden. Rough carts drawn by oxen were present in much of the nonindustrial world. Dogs pulled sleds in the Arctic. Caravan travel was typical of arid regions in Asia and Africa.

Water transportation: Use was made, when possible, of navigable rivers. 1812 ff.: British government began to build canals in Canada to avoid the rapids on the St. Lawrence; this was done partly as a measure of defense against the U.S. 1829: Welland Canal completed in Canada, which improved the St. Lawrence Seaway. 1819: Digging of the Mahmudia Canal, connecting the Nile with Alexandria. The Grand Canal in China (on which construction started in the 5th cent. B.C.), covering some 1,200 miles from Peking to Ningpo, was a major transit route. These canals for internal communication were exceptional in the less developed world. For shipping, the non-industrial world had a wide range of vessels: bark canoes, dugouts, rafts, catamarans, sampans, and a variety of small sailing ships. 1816: 1st steamship launched by Canadians in Lake Ontario. Water transport was developed, often primarily for the purpose of fishing; when used for transport, travel by water was usually superior to and cheaper than overland transit. In short, in the nonindustrial world, transportation facilities were limited, as were the needs for such facilities.

FINANCE. All underdeveloped countries were short of capital.

Financial intermediaries: 1750's: Russia had begun modern banking institutions; 1769: the Russian Note Bank founded; 1817: in Russia, formation of government-owned State Commercial Bank, with specific purpose of granting commercial credits; it was not very active. Spain and Portugal had commercial banking facilities, developed as a result of their long-

time trading connections. Initially, Canadians and Australians depended on Great Britain for banking facilities. By the early 1800's, banks were started in Canada; 1817: 1st bank established in Australia. 1808: The Bank of Brazil was founded (failed in 1829). 1825: Argentina organized a national bank (which survived until 1836). These banks were exceptional in Latin America. Before 1810 a bank at the Cape of Good Hope was established. Japan was exceptional in its range of financial institutions, by the end of the 17th cent. a credit system had developed from money changers, merchant bankers, and financiers of the daimyo which was similar to that existing in Europe in that period; by 1760-1830 Japan had substantial urban banking activity. China too had private banking facilities: some were pawnshops, some "cash shops," which changed one kind of money to another; others received deposits, made loans, bought and sold drafts, and issued bills, which served as money in the locale. In India, indigenous banking consisted of native bankers or "schroffs" who dealt in the large commercial centers and in the courts of native rulers; they aided payments by means of their hundis, or bills of exchange. With the exception of Japan, in no case in the underdeveloped world were financial intermediaries well developed. In fact, in the less developed world large segments of the economy were self-sufficient and not part of a monetized economy, or only peripherally part of one. In Australia in the 1790's rum was the medium of exchange for the white settlers. 1810-21: Under Gov. Lachlan Macquarie, Australia developed a more effective monetary system. In primitive societies there would often be a highly developed system of trade and exchange using shell currencies (the Tolai of New Guinea, for instance) or cattle (in East Africa) or brass rods (in much of Africa); barter was common in many transactions.

FOREIGN TRADE. With the exception of Japan, most nonindustrialized countries felt the impact of foreign trade (some to a greater, some to a smaller extent). Foreign trade served (1) to mone-

tize the economy (barter went only so far; traders usually dealt in money); (2) to jar existing traditional systems (even when European, Arab, and Indian traders recruited native intermediaries to act on their behalf, thus detached men from their villages), (3) to create urban centers (which were often enclaves isolated from the traditional rural activity of the country); (4) to introduce new machine-made products; (5) to create new wants, and (6) in some countries to retard or wipe out existing handicraft activities. World trade was liberalized. Monopolies held by English companies were abandoned. 1765: Spain opened the Caribbean islands to almost unlimited trade with 9 key Spanish ports. 1770: concession extended to Campeche and Yucatán; 1776-77: New Granada. 1778: extended to all Spanish America with the exception of New Spain and Venezuela; by 1790 traders from any port in Spain could buy and sell anywhere in Spanish America. 1769: Monopoly of French East India Co. abolished. 1798: The Dutch East India Co. dissolved. The result of these measures was a great increase in trade. Liberalization of trade did not mean an end to privilege; instead it meant the assertion of new rights by the leading trading nations. Britain, for example, by Anglo-Portuguese treaties of 1642, 1654, and 1661 had obtained special privileges for her merchants in trading in Portugal. 1810: Britain transferred her old privileges and pre-eminent position in Portugal to the Portuguese colony, Brazil. 1827: After independence, Brazil and Britain concluded a commercial treaty, the new empire accepting Britain as having special privileges (including extraterritoriality, consular concessions, guaranteed low import tariff); Brazil lost its right to set its own tariffs; this treaty expired in 1844 and so did the privileges. In general, nonindustrial nations were exporters of primary commodities, usually agricultural products; the imports of non-industrial countries were in the main manufactured goods. Russia exported, with rare exceptions, only raw materials (hemp, flax, wood, grain, tallow, hides, and furs); from China it imported tea, silk, jewels, etc., much of which it re-

exported. Russia depended on Western European nations for most of its colonial products (sugar, coffee, spices, and drugs) and for most manufactures (textiles, metals, pottery, paper, etc.). Spain imported raw materials and precious metals from Latin America, and re-exported much of what it imported in exchange for manufactured goods. Canada exported mainly furs, fish, and timber. Wheat also became an export (but not yet an important one because of the English corn laws). 1821: New South Wales and Van Diemen's Land (Tasmania) exported 175,433 pounds of fine wool; 1831: the total exports were 2,493,339 pounds, and a major export industry had been launched. Both Canadians and Australians were importers of manufactured goods. Latin America by the close of the 18th cent. exported a greater agricultural output per annum than it did precious metals, imports were mainly manufactured goods. With the official end of the slave trade, trade in palm oil and to a lesser extent groundnuts (peanuts) became a staple of West African commerce. With the Industrial Revolution in England, there was more interest in cleanliness, and the soap industry that developed in Great Britain depended on imports of palm oil. About 1825: Liverpool merchants turned their attention to palm oil, and major exports from West Africa began. Interest also arose in palm kernels; 1822: 1st export of palm kernels from West Africa. The demand for groundnuts was stimulated by the soapmakers. 1830: Groundnuts 1st appeared in the trade returns of Gambia. India, 1760: Chief exports were indigo, saltpeter, and manufactured cotton and silk textiles, imports were specie, woollens, and miscellaneous manufactured goods. 1830: India exported very few manufactured textiles; instead, exports were raw materials; imports were manufactured goods. China exported fine textiles, porcelain, and tea, and imported bullion, some manufactured products, raw cotton, and opium. Southeast Asian commerce and the trade of the East Indies involved the export of tropical crops. From the Spice Islands the main exports had changed to coffee and sugar,

since fresh meat was available in Europe (owing to agricultural improvements), and Europeans no longer needed spices to disguise the flavor of spoiled meat. Foreign trade of Africa and Asia was usually conducted by European traders, although Arab and Indian traders were active in Africa. For the most part, European trading companies were content to remain traders rather than colonizers.

FOREIGN INVESTMENTS. Investing by European countries in less developed regions had begun—in foreign loans, trade, plantations, etc.—but the era of giant foreign investments was still ahead.

BUSINESS ORGANIZATION. Foreign trade was dominated by Europeans. Production was developed, resting on ties of kinship, religion, and social status. Guilds were significant in Latin America and in India, China, and Japan. Practically everywhere business was small business, family enterprise; exceptions were isolated state-owned units (in Egypt and Argentina, for example).

GOVERNMENT POLICY. The policy of the state toward economic growth in nonindustrial countries varied, generally governments did little to aid economic change, except for colonial governments seeking trade expansion, but at the same time discouraged manufacturing. In Australia the early British governors granted land and stock—the initial capital for development—to members of the New South Wales Corps, to freed convicts, and to other settlers; the governors tried to make Australia self-sufficient in agricultural products. In Argentina in the 1820's there were abortive attempts to use the government as an agency for economic growth. In Egypt there was a definite governmental effort to industrialize the nation. But such concerted state measures toward economic development were isolated. Whether tribal authority, government by village elders, or other kinds of local government, order and the *status quo* rather than economic progress and growth were basic.

OTHER FACTORS. Throughout the underdeveloped world, ignorance and poverty created their own vicious circle. In general, the desire for industrialization

or for achievement was absent. With the exception of the new settlers in sparsely populated Canada and Australia, traditional patterns (although what was "traditional" varied) were carried on without change or desire for change. Generally, religious and ritualistic customs retarded progress. Practically everywhere in the less developed world, kinship and the extended family took priority over the nu-

clear family and the individual. Climate played a key role in retarding development in much of the nonindustrial world. Much of the tropics were infested with malaria. Filariasis, hookworm, schistosomiasis, and yaws were dangerous diseases. Exposure to high temperatures sapped energy. The impact of the West through trade provided a basis for change, but change was slow.

1830-1870

The Workshop of the World—Great Britain

AGRICULTURE. British agriculture was the most efficient in the world. 1846: repeal of the corn laws; farmers feared the effects on British agriculture; imports did rise, but there was no fall in wheat prices. Demand for agricultural output grew. 1846-73: "Golden age" of British agriculture. Productivity rose. 1840's: Iron and steel plows substituted for heavy wooden plows; iron tooth and disk implements replaced brush and wooden rollers for harrowing. 1850's: Widespread adoption of planting in drills by machine; the cultivator came into use. 1850's ff.: American innovations of Cyrus McCormick and Obed Hussey in reapers and mowers were employed. Fertilizers were well used. 1839: Imports of Peruvian guano on a commercial scale began; the U.K. became a key importer of Chilean nitrates; c. 1840: John B. Lawes (1814-1900) began to produce phosphate from bones to be used as fertilizer; the employment of chemical fertilizers spread. British agriculture became capital-intensive; there was an increase in the proportion of capital to other inputs. Real wages in agriculture rose. Yet, at the same time, British agriculture came to make an ever-lower percentage contribution to national income; agriculture, forestry, and fishing, which comprised 23.4% of national income in 1831, represented only 14.2% in 1871.

RAW MATERIALS. 1830's: New coal

and iron-ore fields were opened in Scotland; 1850's: Cleveland ore field opened; 1860's: Cumberland-Lancashire field developed. 1830-70: Coal output in U.K. rose from 22.4 m. tons to 110.4 m. tons; iron-ore output in 1870 totaled 14.6 m. tons. 1858: Mining and quarrying accounted for about 3.5% of British national income; of this coal mining was 60%, iron ore 9-10%, tin, copper, and lead about 12.5%, and other minerals (including stone, clay, etc.) about 18.5%. The development of mining in Britain was caused by the demands of the iron and steel industry, manufacturing in general, and the growth of railroads. Britain continued to be a large importer of raw cotton, and also of wool, for the textile industry.

ENERGY. The use of the steam engine spread rapidly; steam was the basis for factory industry; it was essential for the "railway age" and significant in ocean travel. 1831: Michael Faraday discovered that electricity could be generated by revolving a copper coil in a magnetic field. 1867: Charles Wheatstone (1802-75) and S. A. Varley invented a dynamo-electric machine, practically simultaneously with Siemens' invention in Germany. These innovations notwithstanding, the age of electricity had not yet arrived.

INDUSTRY. For the 1st time in history a nation was obtaining its major income from manufacturing, machine production.

STRUCTURE OF BRITISH NATIONAL PRODUCT
(as % of national income)

<i>Year</i>	<i>Agriculture, Forestry, Fisheries</i>	<i>Manufac- tures, Mining, Building</i>	<i>Trade, Transport, and Income from Abroad</i>	<i>Government, Domestic, and Other Services</i>	<i>Housing</i>
1831	23.4	34.4	18.4	18.1	6.5
1851	20.3	34.3	20.7	18.4	8.1
1871	14.2	38.1	26.3	19.9	7.6

Productivity in manufacturing rose, and real wages also rose. British manufactures dominated world markets.

Textiles: The cotton textile industry became increasingly capital-intensive as the use of power machinery spread; by the 1850's handloom weavers contributed little to the output of the industry. By mid-cent., England produced half the world's cotton cloth. 1850's and 1860's: Power looms were widely adopted in the woolen industry.

Iron: The British made heavy investments in the iron industry. 1870: Britain produced 6 m. tons of pig iron (almost half the world's total). Iron was used to make boilers, bridges, rails, buildings, ships, and agricultural implements.

**SHARE OF IRON INDUSTRY IN
BRITISH NATIONAL PRODUCT**
(as % of GNP)

<i>App. Date</i>	<i>Gross Output (Less Coal and Imported Ore)</i>
1831	3.6
1851	6.2
1871	11.6

Steel: 1839: J. M. Heath added manganese to crucible steel while it was smelting and made it easier to weld; this lowered by 50% the cost of the best steels. 1856: Henry Bessemer (1813-98) demonstrated the "Bessemer process" of blowing air through molten cast iron and at the same time removing the silicon and carbon by oxidation; the process required the use of pig iron low in sulphur and phosphorus. 1856: Robert Mushet recognized the need to add manganese after the blowing for deoxidation and recarbonation; 1862: the 1st Bessemer steel rails were laid; 1863: Bessemer steel 1st used in ship construc-

tion. 1856: William Siemens (1823-83), German-born British subject, conceived the idea of a gas regenerative furnace, and by 1861 had built one. 1863: The Siemens regenerative furnace was used at the Martin works in France in connection with an open-hearth bath of molten pig iron and scrap to make steel, thus, the Siemens-Martin process. 1867: Siemens started to make steel at Birmingham. 1870: Britain, as the world's largest steel producer, made only 287,000 metric tons.

Chemical industry: In most branches of the chemical industry, Great Britain led. The chemical industry was not a big industry (only 9,172 workers employed in 1851), but it did stimulate scientific inquiry. Britain led in soda manufacture. 1849: Thomas Graham (1805-69) was responsible for the birth of colloidal chemistry. 1856: Mauve, the 1st coal-tar dye, was made in England by William Henry Perkin (1838-1907).

Other technological innovations: 1840: Sir William R. Grove (1811-96) invented the 1st incandescent electric light. 1845: R. W. Thompson invented the pneumatic tire. 1845: I. C. Johnson, manager of Messrs. White & Sons' works at Swanscombe, Kent, produced modern Portland cement.

TRANSPORTATION. Road transport: British roads continued to be improved; early in the 1830's, the steam carriage was heavily taxed. 1835: A Red Flag Law was passed by Parliament, fixing a speed limit of 4 mph on all free-moving self-propelled vehicles and requiring a flagman on foot to walk ahead of the moving vehicle. Thus the steam (and later motor) vehicle industry was retarded and the horse-drawn carriage and wagon prevailed. 1839: Kirkpatrick MacMillan of Dumfries invented the 1st real bicycle.

Railways: From 1830 on canal building declined and railroad building soared.

BRITISH RAILROADS

Date	Miles
1825	26
1844	2,236
1850	6,635
1860	10,410
1870	15,310

1847: Peak of building boom; railway construction equaled c. 12% of national income. 1850: Railways were carrying more goods and passengers than roads and canals.

Transoceanic travel: In international commerce, ocean transit by steamer increasingly replaced the sailing ship. 1834: The East India Co. started to use steamships between Bombay and Suez. 1836: The Oriental Steamship Co. (British) started service to Egypt and Syria; 1838: the British steamer, *Great Western*, was the 1st regular steamship to cross the Atlantic without recoaling. 1839: The Peninsular & Oriental line (P. & O.) established regular steamship service from England to Alexandria to meet ships of the East India Co. which came up the Red Sea. 1840: Samuel Cunard (1787-1865) founded the 1st significant transatlantic steamship line (Cunard Line). 1842: Royal Mail Steam Packet Co. (British) started service to the Caribbean and South America. 1842: P. & O. began to run steamers between Suez and Calcutta; 1845: that co. added a line to Hong Kong. 1845: The *Great Britain* made her 1st voyage; she was the 1st large steamer (over 3,000 tons) to be built of iron and the 1st to introduce the screw propeller in ocean

navigation. 1846: Britain introduced steamer service to West Africa. But of all the transportation innovations, one was outstanding; 1869, Nov. 16: the Suez Canal opened. The canal, built by a Frenchman, Ferdinand de Lesseps (1805-91), and financed by an international company, had a dramatic impact on the organization of British transport. The British Empire became more accessible for trade.

COMMUNICATIONS. 1837: A 5-needle telegraph system was tried on the London & Birmingham Railway, devised by William Fothergill Cooke (1806-79) and Charles Wheatstone (1802-75). 1837: Railways in England were 1st to adopt the telegraph. 1846 ff.: Independent telegraph companies were formed. 1851: The 1st successful submarine telegraph cable was laid across the English Channel, from Dover to Calais. 1866: Transatlantic cable connected America and Europe. 1869: British Post Office bought all existing telegraph lines in Britain.

FINANCE. England was the financial capital of the world. Capital for expansion of industry was practically all internally generated, although industry did resort to some short-term bank financing. Industrial capital was reinvested in more industry; mercantile capital went into industry and transport; funds once invested in land were applied to industry and railroad investments. The government was not an important source of capital. Banking facilities developed rapidly, with joint-stock banks and branches replacing country banks. 1844: Under the Bank Act the Bank of England was divided into 2 separate departments for issue and for banking; no new banks of issue were to be created; the amount of issue of existing

EFFECTS OF THE SUEZ CANAL

	By Cape	By Canal	Nautical Miles Saved (%)
<i>London to:</i>			
Bombay	10,667	6,274	41.2
Madras	11,280	7,313	35.2
Calcutta	11,900	8,083	32.1
Singapore	11,740	8,326	28.8
Hong Kong	13,180	9,799	25.8

banks was not to be increased; country-bank issues were not to be legal tender. The act was designed to eliminate gradually all notes except those of the Bank of England.

FOREIGN TRADE. 1842: Sir Robert Peel secured the reduction of duties on 750 British imports; he reinstated the income tax to make up for loss of revenue. 1845: Peel abolished 430 out of the 813 remaining import duties and eliminated all export duties. 1846, 6 June: Repeal of the corn laws, leaving small duties on grain until 1849 and then only a nominal duty, which was later abolished. The opening of Britain to foreign grain marked her transition from an agricultural to a manufacturing and commercial nation. Foodstuffs would have to be imported from abroad.

BRITISH 10-YEAR IMPORT AVERAGES
(\$ million at fixed prices)

Year	Grain	Animal Foodstuffs
1830's	10.5	8.5
1840's	31.0	17.0
1850's	55.5	18.0
1860's	100.5	66.5

1849, 1854: Britain finally repealed the Navigation Acts, which had restricted commerce. 1853, 1860: British legislation swept away hundreds of remaining import duties and left Britain a "free-trade" nation. 1860, 23 Jan.: the Cobden Treaty with France was signed, heralding freer trade between Britain and France. 1860 ff.: Britain made treaties with Belgium, Italy, Prussia, the *Zollverein*, Austria, etc., obtaining tariff reductions. The free-trade measures had salutary results. The British government did not have to protect industry since there was no competition from abroad. British factories produced goods at lower costs than hand-made products the world over. British foreign trade expanded dramatically; Britain kept her leadership in international commerce. Her foreign trade (exports plus imports) in 1830 was \$564 million, in 1870 it was \$3,186 million. Foreign trade provided a market for

British manufactures; the demand aided in sustaining her industry.

FOREIGN INVESTMENT. 1830's: Some British speculated in American securities (with large losses); 1840's: the British made investments in railroad building in France and Belgium, until crises and revolutions, 1848, slowed this outflow; 1850's: the British made foreign investments in railroads, government securities, and businesses worldwide: in U.S., Canada, Brazil, France, Belgium, Denmark, Sweden, Portugal, Italy, Russia, Turkey, Algeria, British India, and Australia.

BOOK VALUE OF BRITISH FOREIGN INVESTMENT,
1854
(\$ million)

U.S.	250-350
French, Belgian, Dutch, and Russian govt sec.	225-275
Spain and Portugal	175-225
Latin America	175-200
French railways	125-150
Belgian railways	25

BUSINESS ORGANIZATION. The predominant form of business organization in Britain remained the partnership or the unincorporated company. 1844: The Companies Act; 1856: the Joint Stock Company Act, establishing limited liability, and 1862: the Consolidated Statute. These acts made the incorporated co. a more feasible way of doing business and the form came more into use. 1830's: Charles Babbage did pioneer work on factory management—making cost studies of the process of production.

GOVERNMENT POLICY. Government policy in Britain was designed to remove barriers to commerce. Government aid to business was through providing political stability, law and order, charters and rights of ways for railroads, and subsidies to the steamer services. 1842: Peel's reintroduction of the personal income tax gave the government new means of meeting expenses (Britain had had general income taxes, 1798-1816, to cope with war needs); 1842 ff.: income tax remained in operation in Britain. Except in the case of the telegraph the British government

did not directly participate in domestic business. In the colonies, the British government played a more affirmative role, but there existed in England in these years an unfavorable attitude toward colonies. While Britain's imperial responsibilities increased in Australia, New Zealand, India, Ceylon, Malaya, South Africa, and Canada (until Canada was

given dominion status in 1867), the government accepted responsibility in economic matters with grave reservations. Yet improvements in transportation and communication and the 1869 opening of the Suez Canal were factors that forecast greater trade and greater imperial involvement by the British government.

The Spread of Industrialization—U.S. and Western Europe

During 1830–70 industrialization spread to the U.S., Belgium, France, Germany, etc. All (Belgium excepted) were still predominantly agricultural. Yet in these countries the relative importance of agriculture was declining. The gainfully occupied force in agriculture in the U.S. was 70%, 1830, and 53%, 1870; France, 52%, 1860–69; Germany, 47%, 1871.

AGRICULTURE. In the U.S. dramatic changes took place in agriculture. American agriculture moved westward. The fertile prairies of the Midwest came under the plow; large-scale farming operations developed there.

Agricultural innovations: 1830: Chilean nitrate 1st imported into U.S. as fertilizer. 1831: Obed Hussey (1792–1860) of Maryland patented 1st successful reaper. 1831: Cyrus H. McCormick (1809–84) of Virginia established McCormick Harvesting Machine Co., a predecessor co. of International Harvester Co.; 1834: McCormick patented his reaper. 1833: Chicago blacksmith John Lane made 1st steel plow. 1837: John Deere (1804–86) introduced his steel plow; 1847: Deere started a factory in Moline, Ill., to manufacture steel plows; by 1860, the steel plow was standard throughout the American West, but iron plows continued to be used because of the relatively high cost of the steel plow. 1837: Hiram and John Pitts of Maine introduced the 1st successful threshing machine. 1850: 1st chemical fertilizer plant established in Baltimore, Md. 1854: Ket-chum patented his mower. 1856: The Marsh brothers designed a harvester

(with hand binding). 1850's: Grain drills began to displace broadcast sowing of wheat in Pennsylvania and in other wheat-growing areas. Everywhere in the North the use of new farm equipment spread, increasing productivity. In the antebellum South the work was done by slave labor and there was no need for mechanization. 1862–63: End to slavery, but with the Civil War and Reconstruction mechanization proceeded slowly. Agricultural innovation also spread in Europe. 1840: German chemist Justus von Liebig (1803–73) published his *Organic Chemistry in Its Application to Agriculture and Physiology*, dealing with soil chemistry; he argued that by adding chemicals, land fertility would be greatly increased. 1840's: Chemical fertilizers began to be sold in France and Germany to a limited extent. French agriculture, on the whole, remained traditional; there was knowledge of British innovation, of foreign competition, and of prices, but still change was tardy. Plows and threshing machines powered by horses or mules were the only types of agricultural machinery commonly adopted, and the number of threshing machines was limited. Horse hoes, drilling machines, reapers, mowers, horse rakes, and haymaking machinery were used only to a modest extent in France. Retarding agricultural advance in France was the presence of small peasant holdings. By the middle of the 19th cent., French peasants still left some of their land fallow, ignoring information on crop rotation well known in England.

German agriculture, likewise, was slow to adopt agricultural implements, yet on the larger farms east of the Elbe better machinery was being adopted. Transportation aided the merchandising of machinery and fertilizer, and also the farms' produce. 1830-65: There seems to have been an increase in agricultural productivity in German states. In Austria the larger farms were the 1st to begin mechanization, but slowly.

New crops: In the U.S. there were no new crops. Cotton production in the South rose steadily before the Civil War, as the Midwest came to be settled grain moved westward, corn and wheat became far more important American crops. 1850's: 72% increase in wheat production, which took place in the Mississippi Valley, 50% increase in corn production. In Europe, sugar-beet production, which had begun in France, spread, 1830's: a boom in sugar-beet growing in Silesia and Saxony, c 1845: the sugar-beet industry became well established in Germany. Sugar-beet production decreased Europe's dependence on sugar imports from the West Indies and Brazil.

Land reform: In the U.S. the Pre-emption Act, 1841, gave settlers 1st rights to purchase land on which they squatted. 1854: Graduation Act declared lands not disposed of at the government-prescribed minimum could be sold at lower prices. 1862: Homestead Act gave title to 160 acres (at no charge) to a bona fide settler if he lived on the land and improved it. In Europe, land-reform legislation of earlier years took effect. In France the peasant remained the cultivator. In Germany in the west the peasant got title to his holdings by paying indemnities to the lord over a long period of time. East of the Elbe, peasants, who did not have enough land to support themselves, sold all and migrated to the New World or moved to western Germany to become a pool of labor for industry. Open fields became increasingly a thing of the past. By 1850, large landowners could carry out improvements, unhampered by traditional rights and customs. 1848-49. In Austria peasants secured clear title to their holdings after payment of indemni-

ties; the peasant was a free man. In Austria large estates coexisted side by side with peasant holdings.

Commercialization: In the U.S. and in Western Europe there was increasing commercialization of agriculture. In the U.S. the demand for more food production owing to the growing population, especially the urban population, put new incentives on the development of agriculture, the extension of American transportation facilities enabled specialization and meant American agricultural products could go into domestic commerce; the repeal of the corn laws in England, 1846, opened British markets to American grain. In Western Europe, new transportation connections also increased the specialization and commercialization of agriculture, but the process was slower because of the presence of peasant holdings. When in the late 1840's and early 1850's the British market was opened to Danish grain, butter, and livestock, Danish agriculture prospered.

RAW MATERIALS. 1818: Gold was discovered in California. In the U.S. there was an expansion of mining of basic minerals, coal, iron, and copper (1845: copper output 100 long tons; 1870: 12,600 long tons). 1859. Drilling of Drake's well at Titusville, Pa., this became the world's 1st commercial oil well. 1859: U.S. petroleum production 2,000 barrels; 1870: 5.3 million barrels; a new industry had been created. 1830's: The French undertook a search for additional coal resources; expansion of production in the Pas de Calais, France was short of coal and yet levied tariffs to protect high-cost domestic production; 1847: discovery of coal fields in the Nord; output expanded. German coal resources were superior. The 3 main coal fields (the great Ruhr field, the Roer field, and the Silesian field, on which mining began in the 1840's) provided a basis for the German iron and steel industry. 1830's. Large-scale mining began in the western fields; by 1846, German coal production was roughly 3.2 m. English tons a year, which was less than the U.S. total of 5.3 m. tons, or the French total of 4.5 m. tons, the Germans still thought their resource base was "limited."

By 1870 Germany's position had improved.

COAL PRODUCTION, 1870
(million metric tons)

Great Britain	112.2
Germany	34.9
U.S.	29.9
France	13.3
Belgium	13.6
Austria-Hungary	8.4

1840's: Belgium was producing more iron than the entire *Zollverein*; 1870: growth of German iron mining. By 1870 German iron-ore production was the greatest on the European Continent. Germany had excellent resources for a chemical industry

—not only coal but potash deposits. 1856: German potash deposits developed in Stassfurt. Sodium chloride, potassium salts, and sulphur could be extracted from German deposits of iron pyrites. The German resource base gave Germany a superior position in the chemical industries. With British free trade, there was a demand for Swedish iron and Sweden expanded its iron-ore production.

ENERGY. 1837: Frenchman Benoît Fourneyron (1802–67) developed the water turbine, with 60 hp. 1840's: Uriah A. Boyden (1814–79) introduced Fourneyron's water turbine to the New England textile industry, thus retarding introduction of steam power. Yet steam as an energy source spread most rapidly

CAPACITY OF ALL STEAM ENGINES
(million hp)

	U.S.	U.K.	France	Germany	Belgium	Austria	Russia	Italy
1840	.76	.62	.09	.04	.04	.02	.01	.01

1860	3.47	2.45	1.12	.85	.16	.33	.20	.05
1870	5.59	4.04	1.85	2.48	.35	.80	.92	.33

1837: Thomas Davenport of Rutland, Vt., was 1st to produce a successful electric motor. 1838: Charles Page of Boston drilled steel plates with a battery-driven motor. 1860–63: Antonio Pacinotti in Italy improved the design of generators. 1867: German Ernst Werner von Siemens (1816–92) announced invention of the electric dynamo. (His work came simultaneously with that of Wheatstone and Varley in England.) 1870: French engineer Z. T. Gramme (1826–1901) made a ring dynamo, the 1st commercially practical generator of direct current.

INDUSTRY. In the U.S. manufacturing in every industry from food processing to lumbering to iron (and steel) to metalworking spread. The U.S. became independent of imports of basic manufactured goods. On the Continent, Belgium became the great manufacturing country, consuming more coal and iron per capita than any country besides Great Britain. 1810's: Expansion of textiles in France; 1850's and 1860's: expansion of iron industry. 1835 ff.: German industrial development accelerated. 1830 ff.: Progress

in Austria in cotton textiles, woolens, silk goods, and paper; development was mainly in lower Austria and Bohemia.

Textiles: The important innovations in the U.S. textile industry had taken place before 1835, the industry (although the largest American industry in terms of assets) became conservative in nature. 1845: Frenchman Josué Heilmann (1796–1856) invented a machine comb for combing cotton and wool. While mechanization of the textile industry increased in France, Belgium, Switzerland, Germany, and Austria, their textile industries did not become a leading sector as had textiles in England. 1850: Raw-cotton consumption in France, Belgium, and the German *Zollverein* combined was far less than half that in Great Britain.

Iron and steel: 1839: 1st successful coke-smelting furnaces in U.S. built in Maryland; success with smelting anthracite on a commercial scale achieved at Pottsville, Pa., under the supervision of English ironworker Benjamin Perry; this marked a new era in American iron technology. 1840: American Henry Burden (1791–

1871) introduced rotary concentric squeezer for working puddled iron free of slag. 1845: Foundation of Trenton Iron Works; 1851: foundation of the Cambria Iron Works; 1853: foundation of Jones & Laughlin, pioneers in the modern American iron industry. 1847: Pittsburgh-born William Kelly (1811-88) refined molten pig iron with a blast of air in an acid-lined vessel. 1856: The 1st Bessemer patents were taken out in the U.S., but the Commissioner of Patents awarded Kelly priority. 1864, Sept.: The 1st production of steel in the U.S. under the Kelly process done at the Wyandotte Works, Mich. 1865: A. L. Holley (1832-82) built at Troy, N.Y., the 1st Bessemer steel works in the U.S.; 1866: Kelly and Bessemer interests merged in the U.S.; 1867: Abram S. Hewitt (1822-1903) acquired American rights to use and license the Siemens-Martin open-hearth process of making steel. 1869: F. J. Slade built the 1st open-hearth furnace for steelmaking in the U.S. for Cooper, Hewitt & Co. Belgium with its well-located coal resources took the lead in the European iron industry; its per capita production continued high, but it was quickly surpassed in total production. France's coal resources were poorer and not well located, and thus it lagged. 1850: France still smelted more than half its iron ore in charcoal furnaces. 1850's and 1860's: France completed the transformation to coke smelting. 1863-67: Bessemer steel converters were adopted in 6 great French ironworks. 1863: Émile and Pierre Martin (father and son) in Sireuil, France, 1st used successfully the open-hearth process; their use of pig iron and scrap steel to make steel became known as the Siemens-Martin process. Germany was slower than France to develop a modern iron industry. 1847: 1st coke blast furnace constructed in the Ruhr. 1867: August Thyssen (1842-1926) founded his works in Duisburg for the manufacture of hoop iron. 1868. For the 1st time German pig-iron production surpassed that of France. 1849. Lohage and Bremme started a company to make steel by puddling, a major advance in producing cheap steel. 1851: Alfred Krupp (1812-87) demonstrated at the Crystal

Palace exhibition in London a 2-ton flawless block of cast steel, his Essen steelworks achieved international fame. Germany took a clear lead in the European steel industry.

Metalworking industries: Americans took the initiative in the metalworking industries. Locomotives: 1832: Baldwin Locomotive Works established in Philadelphia. 1834: Norris Works built to make locomotives. Guns: 1836: Samuel Colt (1814-62) invented the revolver (1853: he built a new armory south of Hartford, Conn with 1,400 machine tools). 1847: Eliphalet Remington (1793-1861) put Remington pistol on the market (built at Remington's works at Ilion, N.Y., est. 1816). 1860: Oliver F. Winchester (1810-80) introduced repeating rifle; 1862: Richard J. Gatling (1818-1903) invented the revolving machine gun. Printing: 1846: Richard M. Hoe (1812-86) invented the rotary printing press. Sewing machines: 1846: Elias Howe (1819-67) patented the sewing machine; 1850: Isaac M. Singer (1811-75) invented the 1st practical sewing machine; 1858: Lyman R. Blake (1835-83) patented a machine for sewing the tops of shoes to the bottoms; 1862: Gordon McKay (1821-1903) improved Blake's machine. Washing machines: 1847: 228 U.S. patents issued for washing machines. Machine tools: 1848: Frederick H. Howe (1822-91) designed the 1st milling machine manufactured for sale; it was made by the arms maker Robbins & Lawrence Co., Windsor, Vt; the milling machine was used in production of small arms, clocks, sewing machines, and other light metal products made by mass production; by 1860 it was well established in American shops; 1830 ff.: Americans began to take

world leadership in the machine-tool industry. Grinding machines driven by power, lathes, shapers, planers, drill presses became common in American shops; the use of interchangeable parts (machine-made parts of uniform design) in mass production by mid-19th cent. was known as the "American System"; 1855 ff.: specialized tool builders came into being; 1860: Francis A. Pratt and Amos Whitney founded Pratt & Whitney of Hartford, Conn., to make machine tools for guns and sewing machines. Safety pins: 1849: Walter Hunt invented modern safety pin. Elevators: 1852: Elisha G. Otis (1811-61) invented 1st passenger elevator. Railroad cars: 1864: George M. Pullman (1831-97) made 1st railroad car for sleeping. Typewriters: 1867: Christopher Sholes (1819-90) invented 1st practical typewriter. Vacuum cleaners: 1869: I. W. McGaffey patented a suction-type vacuum cleaner. On the European Continent there was no similar large-scale proliferation of metalworking industries. John Cockerill's Belgian engineering works, est., 1817, stood out in the heavy industries; by 1839, it was making locomotives, engines, and machinery of all descriptions and employed 4,320 persons; Belgian machinery was exported to Holland, Russia, and Germany. In France, metallurgical industries consisted of skilled cutlers (who made fine handmade goods), small shops manufacturing specialized machinery and machine tools, manufacture of textile machinery (esp. in the 1860's; Schlumbergers of Mulhouse, Alsace, was the 1st in France and among the 1st in Europe), engineering firms, such as Schneiders of Le Creusot, would make a range of metallurgical products on order, including steam engines and other industrial machinery. 1830: German metalworking industries were mainly artisan industries; 1830-1870: there developed the engineering shops of Harkort, Borsig, Egells, which made locomotives, marine engines, and lathes; Alfred Krupp's Essen works made grinding machines and other machine tools.

Electrical industry: The electrical industry was in its infancy. The 1st applications were to the telegraph. 1847: The German firm of Siemens & Halske was

established, one of the world's earliest and most important electrical firms. 1869: In Chicago, Western Electric Co. formed, as a supplier to Western Union.

Chemical industry: 1837: Proctor & Gamble (soap and candles) was established in Cincinnati, Ohio. 1839: American Charles Goodyear (1800-1860) accidentally discovered the process of vulcanizing rubber. 1840: British traveler John Bowring reported of Germany, "Chemical knowledge in its various branches is further advanced than with us." 1840: 1st soda produced in Germany by the Leblanc method. 1840-70: German soda and sulphuric acid production was less than in France; the German chemical industry had diversity; it turned out the rarest pharmaceuticals, alkaloids, and organic acids. 1843 ff.: German A. W. Hofmann made major strides in industrial uses of coal tar; he stimulated the development of industrial chemistry in Germany and England. 1845: A. P. Sharp (later Merck, Sharp & Dohme) opened apothecary shop in Baltimore, Md., 1846: Swiss chemist C. F. Schonbein (1799-1868) discovered nitrocellulose or "explosive cotton wool"; Italian A. Sobrero (1811-70) discovered nitroglycerin 1849: Chas. Pfizer & Co., fine chemicals, established. 1855: 1st commercial production of aluminum started at Rouen, France (using process developed by Henri Sainte-Claire Deville); sulphuric acid was extracted from zinc ores in Germany; German F. Gaedcke obtained cocaine from coca leaves. 1863: Belgian Ernest Solvay (1838-1922) began to operate process for production of soda. 1865: French chemist Paul Schutzenberger (1829-97) invented "celanese," acetate rayon. 1866: the Swede Alfred Nobel (1833-96) invented dynamite; in U.S., Duffield, Parke & Co. (later Parke, Davis) established. 1869: Celluloid, the 1st successful pyroxylin plastic, manufactured in the U.S. by J. W. & I. S. Hyatt, Albany (patented 1868).

Other industries and innovations: 1851: American Gail Borden (1801-74) began commercial production of condensed milk. 1855: Bunsen burner invented in Germany. 1859 ff.: Kerosene began to be

used to light residences and offices in the U.S. and Europe.

% DISTRIBUTION OF WORLD'S
MANUFACTURING PRODUCTION, 1870

U.K.	31.8	Russia	3.7
U.S.	23.3	Belgium	2.9
Germany	13.2	Italy	2.4
France	10.3	Others	12.4

TRANSPORTATION. Roads: In the U.S. and Europe roads were improved. 1845-70: Great age of Prussian roadbuilding.

Canals: 1830: 1,277 miles of canals in the U.S.; 1840: 3,326 miles of canals; 1859: 3,698 miles of canals, the end of the "canal era"; by 1850 there was more abandoned canal mileage in the U.S. than there were new additions. 1830: 1,260 miles of canals in France. 1835-48: 1,200 miles of major canals newly cut in France, linking the Rhine to the Rhone, from the Marne to the Rhine, and from the Aisne (near Berry-au-Bac) to the Marne above Épernay. 1848: End of 1st canal era in France. 1860: Imperial Plan in France: canals and canalized rivers were improved and modernized. 1869: 2,736 miles of canals were open in France. By 1870 most of the German river basins were linked by canal. Other inland waterways were improved in the U.S. and Europe. Steamboat travel became the norm. American entrepreneur Cornelius Vanderbilt (1794-1877) made his fortune out of steamboats.

Railroads: In the U.S. railroads rapidly replaced canals as the typical means of travel. U.S. railroad mileage: 1830, 23; 1840, 2,818; 1850, 9,021; 1860, 30,636; 1870, 52,922. 1869: 1st transcontinental railroad completed in the U.S. America led the world in the construction of railroads. The railroad system in the U.S. was privately owned, but was aided by land grants and subsidies from the government. 1832: 1st steampowered railroad started operations on the European Continent: the French railway line, St.-Étienne to Lyons. 1835: 1st Belgian railway, Brussels to Malines, opened; 1st German railroad from Nuremberg to Furth covered 5 miles. 1839: 1st Dutch railway, Haarlem-Amsterdam. The 1st French railway was

built by private capital; the French state aided private cos.; 1842: the French national railroad program was drafted; 1857: French railroads for the 1st time carried more traffic than French waterways; by 1859, 6 great cos. controlled the French railroad system; the cos.' profits on part of the system were guaranteed by the state; 1860-70: decade of most intensive railroad building in France. 1870: The French railway system was basically complete. The 1st Belgian railroad was state-built, as was the basic system; private cos. were also allowed to construct railroads in Belgium. Railroad expansion in Germany accelerated; in Prussia, private cos., aided by the government, took the initiative (1844, 500 miles in operation; 1860, 3,500 miles in operation); in western and southern Germany, railroads were state-owned from the start. 1840, 92% of German railroads were owned by private cos.; by 1870, 57% were in private hands. 1850-70: The key railroad connections were completed in Western Europe. 1870: Railroad mileage (thousands of miles): U.S., 52.9; Germany, 12.2; France, 10.8; Belgium, 1.9. Railroads in the U.S., Belgium, France, and Germany provided a basis for other industries to develop. Railroads opened new mining regions. Railroads stimulated the iron and then the steel industries, and the metallurgical and timber industries. They encouraged construction. Because they were capital-intensive, they served to attract capital. Railroads, inasmuch as they required new products spurred innovation. In the U.S. railroads provided a means of extending settlement. Railroads in Germany connected navigable rivers, brought together the German states, linked Germany with Poland and Russia, and gave Germany the opportunity to develop its trade in Central Europe and the Balkans. In every nation, railroads created national unity and a national market, gave industries the possibilities of economies of scale, and provided opportunities for industries to obtain cheaper raw materials. Good transportation links opened the way for more specialization, better utilization of resources, and thus cost advantage; similarly, faster transportation lowered costs

and offered economies. 1869: 1st use of refrigeration in railway transit in the U.S., which would in time revolutionize railroad haulage.

Transoceanic travel: Despite the pioneering *Savannah*, Americans were slow to adopt the steamship for ocean transit, clinging to the sailing ship. 1840's: The fastest clipper ships crossed the Atlantic eastbound in about 14 days—as did contemporary steamships. 1844: The *Midas*, owned by Boston merchant R. B. Forbes, left Boston for Hong Kong, arriving 14 May, 1845, the *Midas* was the 1st American steamship in Chinese waters (though she traveled mainly under sail). 1844 ff.: use of the steamship spread; 1846: Ocean Steam Navigation Co. established in U.S. as a subsidized steamship line, N.Y.-Bremen. (It went out of business in 1857 when its mail contract ran out.) 1847: Collins Line established in U.S. with a mail contract to Liverpool (1858: suspended operations). Other U.S. government-subsidized steamship lines developed. European steamship lines also started. 1837: Messageries Maritimes, a French line, introduced a steamer service between Marseilles and Alexandria, 1838: an Austrian steamship line, Lloyd, began a Mediterranean service. 1840: The French government offered to subsidize the establishment of a steamship line between Le Havre and New York and to establish government-owned and operated lines to the Caribbean and South America. 1847: The Hamburg-Amerika Line founded (1856: adopted its 1st screw-propelled steamer). 1851: The French Messageries Impériales began operations in the Mediterranean and extended services into the Indian Ocean, to the Far East, and to the South Atlantic. 1861: The Compagnie Transatlantique, founded by the Péreire brothers, connected France and Mexico. 1867: North German Lloyd lines began a weekly service to New York.

COMMUNICATIONS. 1836: Samuel F. B. Morse (1791–1872) invented a practical electric telegraph. By 1846–47, New York was connected to Albany, Boston, Buffalo, Cleveland, Detroit, and Chicago by telegraph. 1861: Telegraph connections in the U.S. made with the

West Coast. 1840's: Telegraph lines spread throughout Europe. 1850's: Submarine cables introduced. 1866: Completion of the transatlantic cable.

FINANCE. Capital, although still scarce, became more plentiful in the U.S. as business growth occurred. Foreign capital (mainly British) was invested in the U.S. in the 1830's, and in the 1850's, the late 1860's, and the 1870's. On the European Continent, capital was locally generated and also came from Britain. Financial intermediaries developed. 1833: U.S. federal funds were deposited in state banks, "pet banks." 1834–37: Growth in number of state banks in the U.S. from 506 to 788; by 1860, 1,562 state banks. 1864, 3 June: National Banking Act passed in the U.S., designed to deal with both monetary chaos and fiscal needs, established a national banking system, national banks could issue a uniform paper currency and national bank notes. 1865: Congress placed a 10% per annum prohibitive tax on the notes of state banks, thus effectively giving sole privilege of bank note issue to the national banks; the number of national banks increased, while the number of state banks decreased. Investment banking by J. P. Morgan, A. Belmont (representing the Rothschilds), and S. G. Ward (representing Baring Brothers) began to make headway in the U.S. On the European Continent modern banking facilities developed. 1835: Banque de Belgique and Banque Liégeoise founded in Belgium; 1841: Bank of Flanders established. These banks along with the Société Générale provided Belgium with banking facilities to aid her industrialization. 1850: The Belgian Parliament reformed the banking system, establishing a central bank, the Banque Nationale, which received a monopoly of note issue. 1830's: The Bank of France, under sound and successful management, expanded steadily; 1818: Bank of France awarded a monopoly of note issue. 1848: Revolution in France destroyed existing credit institutions; the government helped found Comptoir National d'Escompte (collapsed 1889). 1852: The Crédit Foncier, the famous mortgage bank, founded. 1852: Émile

and Isaac Péreire established *Crédit Mobilier* in Paris for industrial finance (failed 1867), while it lasted, *Crédit Mobilier* financed railroad cos. as well as dock and gas cos. 1855 ff.: the Paris market played a key role in financing European railroads, of importance besides the Péreires, were the Paris Rothschilds. 1859: France's 1st real deposit and loan bank founded, the *Crédit Industriel et Commercial*. 1863: *Crédit Lyonnais* established; 1864: *Société Générale pour Favoriser de Développement du Commerce et d'Industrie* in France started operations. 1850's and 1860's: Foundation of new era in French banking; industrial banks were important in stimulating growth 1830 ff. Frankfurt played an important role in European finance because of the Rothschilds. 1846: Prussian Bank took the place of the previous State Bank, which marked the start of modern banking in Prussia. 1848-56: foundation of important joint-stock banks in Germany: *Bankverein* of A. Schaaffhausen in Cologne, 1848; the *Diskontogesellschaft*, 1851; the *Bank für Handel und Industrie* in Darmstadt, 1853; and the *Berliner Handelsgesellschaft*, 1856. 1870: *Deutsche Bank* founded 1855: The Austrian *Kreditanstalt für Handel und Gewerbe* was established, it became the largest commercial bank in Austria.

FOREIGN TRADE. After Great Britain, France and the U.S. followed in volume of foreign trade. 1870: French foreign trade (exports plus imports) totaled \$1,091 million, U.S. foreign trade, \$867.6 million. 1832-60: U.S. tariffs were scaled down or shifted from specific duties to ad valorem duties. 1861: High Morrill tariff passed 1861-69: U.S. duties increased to an average rate of 47%. 1870: Minor reduction in U.S. tariff. In France, high tariffs remained until c. 1860, when France began to lower tariffs. 1860: France signed commercial treaty with Britain; 1861: trade agreements were made between France and Belgium, Italy, and Switzerland; 1862: trade agreement between France and Prussia, and, 1866, by extension, France and the *Zollverein*. In Germany, 1 Jan., 1831, *Zollverein* tariff established, forming into a customs

union $\frac{2}{3}$ of the German states; other states subsequently joined 1834-48: The *Zollverein* tariffs on manufactured goods rose. 1841: Friedrich List's (1789-1846) doctrine of protecting infant industries appeared in Part I of his *National System of Political Economy*; the doctrine had a keen impact on German policy. 1860's: Temporarily, there was a liberalized trade policy. 1863 and 1865: Trade agreements were made between Prussia and Belgium. 1865: trade agreements were made between Prussia and Britain and Prussia and Italy. In short, in the 1860's, when the U.S. was moving toward a higher tariff, France and Germany were, temporarily, moving in the other direction.

FOREIGN INVESTMENT. The U.S. and France were net recipients of foreign investment, while the Dutch were important international investors.

BUSINESS ORGANIZATION. In the U.S. the corporate form came to be used more frequently (the U.S. led the world in the use of this form); it was still mainly used for banking, insurance, and public utilities. 1856: Western Union Telegraph Co. became America's 1st giant corporation. In the U.S. most corporations continued to be incorporated by special charter granted by the states, although increasingly states were adopting general incorporation laws. Belgium had taken the leadership on the European Continent in using the joint-stock co. form (*société anonyme*). 1830's and 1840's. In France the joint-stock co. form was rare and used mainly for banking, insurance, and public utilities. There was far wider use of the *société en commandite sur action* form. 1850's: The French put such forms under stricter government control. Although the form remained important, the *société anonyme* form began to be used more frequently. 1863: France created the *société à responsabilité limitée*, a true limited-liability company. 1867: The need to get individual authorization for every *société anonyme* was eliminated. 1838. Prussia adopted a railway co. law, based on the French Commercial Code. 1843: Prussia adopted a general law for joint-stock cos. Yet by the 1860's only in

Hamburg and Bremen could a co. come into existence without a special government authorization. The joint-stock co. form was still rare in Germany.

GOVERNMENT POLICY. In the U.S. under Andrew Jackson (President, 1829–1837), the federal government stayed out of business. The Maysville Road veto, the veto of the charter of the National Bank, and the lowering of the tariff were reflections of a laissez-faire philosophy. State and municipal governments, however, contributed to building transportation facilities. 1840's: The U.S. federal government began to subsidize steamship lines. 1850's: the U.S. government started aid for railroad construction. 1861 ff.: Steady rise in U.S. tariff. In France under the July Monarchy and 2nd Empire the government assisted transportation ventures. German industrialization was dependent on political considerations. The German state governments invested directly in railroads. The Prussian state government operated ironworks and leadworks and coal mines. German states brought in

technicians to aid development. 1834: The formation of the German *Zollverein*, 1834, and the North German Confederation, 1867, directly aided economic growth by creating a national market. 1834–67: Most customs duties on imports of machinery were used by the *Zollverein* to promote manufacturing—textile mills, paper mills, and sugar-beet plants. German polytechnic schools and universities were state-supported; they provided technical and scientific training which proved a special aid to the chemical and electrical industries.

OTHER FACTORS. From 1839 to 1879 the U.S. GNP is estimated to have grown at 4.3% per year. In France, the Industrial Revolution was gradually effected in an environment of political turmoil. Germany had to await complete unification before its Industrial Revolution could flower. Belgium, once it achieved political independence in 1830, led in the Industrial Revolution taking place on the European Continent.

Economic Change in the Less Developed World

AGRICULTURE AND ANIMAL HUSBANDRY. In most of the nonindustrial world agricultural conditions prevailing between 1760 and 1830 persisted without change. Yet some changes did occur.

Scientific agriculture: 1830's and 1840's: In Egypt land under cultivation increased, owing to large-scale irrigation works. 1830–70: There was increasing application of scientific techniques to Japanese agriculture. 1830: British engineers in India began to reconstruct the Indian canal system (the Western Jumna, Eastern, and Cauvery canals) to provide irrigation. 1836: Surveys were made for the great Ganges Canal (opened 1854); 1846: Godaveri Canal planned, for irrigation; 1850–70: canal making spread over India, penetrating deserts and wasteland to bring water to land to extend cultivation. Australian sheep raising expanded dramatically, using modern methods. When

plantation agriculture was introduced by Westerners into the tropics, the techniques were western in origin.

New crops and livestock: Tea: 1834: Lord William Bentinck sent a committee to China to obtain tea seeds and Chinese labor and to introduce the crop in northern India. 1835: Government tea plantations were started in Assam on these Chinese foundations; Assam, however, had a native tea plant; the British tried to market it and were successful. 1850's: cultivation of the native tea plant progressed rapidly in Assam, Bengal, southern India, and Ceylon; the capital promoting the expansion of tea was European. Jute: 1838: The regular export of raw jute from India to Dundee began. Coffee: 1830's: Systematic cultivation of coffee as a plantation industry began in India; it flourished up to 1862, when the deadly borer beetle and leaf blight ap-

peared; 1885: almost complete end to coffee cultivation. 1830's: Crown land sold to planters in Ceylon; 1869: 176,000 acres under coffee; fungus attacked the coffee plant in Ceylon and after 1876 the coffee plantings were ruined. In Java large-scale coffee cultivation developed, as also in Brazil and Colombia; in Brazil coffee was plantation agriculture; in Colombia it was peasant agriculture. In Brazil, as sugar, tobacco, and cotton became less profitable, coffee assumed key importance in the national economy. Sugar-cane cultivation continued in the West Indies and Brazil. In Hawaii, under the impact of Americans, sugar-cane cultivation spread. In Java sugar-cane cultivation, although not new to this period, was greatly enlarged; sugar was grown on the sawah land used for rice cultivation. 1830 ff.: in the Ukraine sugar-beet cultivation began. Quinine: 1865: cinchona (quinine) plantations started in Java. Palm oil and peanut production in West Africa greatly expanded, stimulated by the growth of the European soap industry. Sheep: 1844: 1st sheep station in New Zealand started in the Wairarapa, with sheep imported from Australia.

Landholding: In eastern Europe the feudal manorial system began to break down. By 1850 in Livonia, Hungary, and Rumania large estates were employing wage labor. 1861: End to serfdom in Russia; land reform established a landowning peasantry. In Japan land passed into the hands of the merchants, by 1853, Japanese merchants controlled more than 30% of the cultivated land in that country, acting as rent receivers; among the large landowners were the Konoike and Mitsui commercial houses; there emerged in Japan a wage labor force as a result of peasants losing their land; agriculture became more efficient; intensive cultivation by peasant families proved highly productive in Japan. In India the British land reforms had not made agriculture more productive, since they left virtually unchanged the basic process of production. In China, with no primogeniture, landholdings became more fragmented. There is no indication that agriculture became more efficient; in fact, the op-

posite seems possible. After acquiring Algeria (beginning 1830) the French decided to treat land in that country as private property. A land law, 1863, led to the breaking up of village holdings and the acquisition of about 20% of the best land by European settlers. New European settlement in Canada, Australia, New Zealand, and Latin America meant new landholdings. In Canada settlement extended into more of the country. Land laws in Australia tried to encourage cultivation, but despite the land laws wool remained the staple, farming did not take priority over grazing. 1829: Edward Gibbon Wakefield (1796-1862) in England advocated systematic immigration to Australia and favored land sales at a "sufficient price" within Australia; 1831: land grants were abolished in Australia; all land was sold; 1835: South Australian Co. formed for colonization; 1861: Crown Lands Alienation Act in New South Wales allowed anyone to select 10 to 320 acres of crown land (raised to 640 acres maximum in 1875) and pay £1 an acre (5s. down); similar land acts made available land to settlers in Victoria. 1837 ff.: Traders, speculators, and missionaries began to buy land in New Zealand; 1839: the New Zealand Co. started to sell land in that country at £1 per acre to colonists and investors. Latin America: 1840-60: New public lands were settled in Colombia, and the government distributed them to farmers in medium-sized plots, a policy in sharp contrast to that of the Mexican, Chilean, and Argentine governments, which made huge land grants, continuing the prerevolutionary practice of large landholdings.

Commercialization: Throughout the less developed world, agriculture became more commercial, as transportation facilities made it possible to market crops, as European traders and investors created new means of bringing produce to market, and as the volume of world trade increased. 1830: Johannes van den Bosch, gov. gen. of the Netherlands East Indies, introduced a forced-delivery plan, known as the "culture system"; each peasant, instead of paying a land tax, had to cultivate government-owned export crops on

$\frac{1}{2}$ of his fields or, alternatively, to work 66 days a year on government-owned estates or other projects; the system was most important in Java, but was also present elsewhere in the Dutch East Indies; the new system, with commercialization as its goal, tested out a wide variety of crops (indigo, sugar, coffee, tea, tobacco, pepper, cinchona, cinnamon, cotton, silk, cochineal); coffee and sugar were at first the most successful.

Increase in cultivated land area: With scientific agriculture in some countries, with new crops in others, with changes in the structure of landholdings, with new settlement, and with commercialization, cultivation of lands in the less developed areas was extended. Also encouraging the spread of cultivation was the extension of the railroads. Factors retarding the development of agriculture in the less developed world were (1) use of traditional methods; (2) general absence of mechanization; (3) lack of capital to be applied to agriculture; (4) absence of extensive transportation facilities; (5) absence of a developed marketing structure to encourage surpluses; (6) absence of information (as late as the 1850's and 1860's, there was a widespread belief that a large portion of what is now the Canadian Northwest was unfit for agriculture on account of the climate and the soil); (7) absence in some cases of agricultural labor (in Australia and in much of Africa); and (8) giant landholdings in much of Latin America (that were not efficiently farmed) and small landholdings in much of Asia (that were too small for efficient farming).

RAW MATERIALS. The economic development of 2 less developed nations was sharply spurred by the finding of precious minerals: 1851: gold was discovered in Australia (in New South Wales and Victoria); 1867: diamonds were discovered in South Africa. Both encouraged immigration to the countries and brought wealth in their train. So great a spur was the discovery of gold in Australia that by 1861 the estimated gross national income per capita was \$250; the average for Britain (excluding Ireland) in 1861 was

about \$150: Australia had become relatively rich. 1858: Discovery of gold in New Zealand caused a smaller "gold rush." 1830: An English co., the São João d'El Rei Mining Co., leased a mining property in Brazil; later it worked the Morro Velho mine; from 1837 to 1865 its production of gold alone was valued at \$18,180,133. The mining of industrial minerals in the less developed nations proved less dramatic. Coal production was concentrated in the important industrial and industrializing nations. Compared with them in 1870, Russia's output of .69 million metric tons, Spain's .66 million metric tons, and India's .61 million metric tons were humble. In Canada, in the 1850's, coal mines in Cape Breton, Maritime Provinces, opened, Cape Breton coal replaced coal imports from England. 1858: The coal fields at Arroio dos Ratos in Brazil began to be worked. Japan had coal adequate to its early needs, and by 1869 the Hizen domain had a modern coal mine in operation, started with British capital and technical assistance. Iron production was concentrated in the important industrial and industrializing countries, although Spain, Algeria, and Cuba had iron-ore resources and were exporters. Russia was known to have good iron resources, but these were not well situated; Russian iron-ore production rose slowly. The Brazilian iron mines of Ipanema were being worked on a small scale; the iron deposits in Minas Gerais were known. Iron mining was done in Canada in Ontario and in New Brunswick. The less developed countries excelled in other metals. Copper: 1850: Chile took the world's leadership in copper production. Tin: While in 1870 Great Britain was the world's largest tin producer, less developed countries followed. In the Malay Peninsula, British and Chinese capital and entrepreneurs developed the tin mines. In the Dutch East Indies the islands of Banka and Billiton were most important as sources of tin. On Banka the mines were controlled by the Dutch government, while on Billiton (where tin was found in 1851) the mines were privately owned. 1849: Tin was discovered in Australia.

TIN PRODUCTION, 1870

Australia	2
Bolivia	.1

In the new oil industry, where the U.S. took the leadership, by 1870 Russian production was .21 million barrels. Rumania, in 3rd place, had an output of .08 million barrels. 1859: Oil discovered in Canada, but production was negligible.

LABOR. In much of the less developed world slavery still remained, but was declining in importance. 1833, 23 Aug.: Britain abolished slavery in the British colonies. 1851: New Granada (later Colombia) abolished slavery. 1854: Ecuador and Venezuela ended slavery. 1861: End to serfdom in Russia. Education in the less developed world was generally on a low level, although Japan's urban population was literate; in Japan in the 1860's new schools, teaching western science, opened. China had a scholar aristocracy with the mass of the people uneducated. Missionaries from the western nations created schools and spread education. In the Gold Coast, for example, the Basel Mission trained craftsmen, carpenters, blacksmiths, and mechanics; the Gold Coast would become a recruiting ground for nearby African countries that wanted skilled labor. Missionaries transmitted western ideas and values. Likewise, in areas of new settlement educational standards of the West began to be communicated.

ENERGY. Human and animal power, wind, and water still provided the main sources of energy in the nonindustrial world. Steam had minor impact in some factories and in transportation.

INDUSTRIES. The conditions of 1760-1830 remained in most of the less developed countries. Modern machinery and methods spread slowly. Nowhere was the industrial sector substantial and yet it existed in embryo. In Russia a modern cotton textile industry slowly began to emerge after 1830, primarily in the prov-

inces of Moscow and Vladimir. In 1850 there were 1,300 power looms in the Russian cotton textile industry, and in 1860, 10,000 power looms, but in 1859 Russia had 86,000 handlooms, producing $\frac{1}{4}$ of Russian cotton cloth. The Russian wool industry also began to mechanize, but even more casually. 1840: Sugar-beet refineries in the Ukraine began to use steam power; 1861: 85% of Russian sugar production was from refineries using modern machinery. The Russian iron industry grew slowly. Pig-iron production: 1830, 182,953 metric tons; 1870, 359,531 metric tons. By 1857 locomotives were being made in St Petersburg. In Canada the lumber industry of earlier years expanded; shipbuilding existed based on the wood resources. 1830 The Canadian iron industry was inefficient and on a small scale: stoves, axes, agricultural implements were made in Canada. 1860: 1st Canadian rolling mill opened at Toronto. 1866: Iron and nail works were one of the key industries in Montreal. By 1870 iron products to supply the railroads were produced in Canada and other iron products were made in quantity, but many iron manufactures continued to be imported. Tanneries, whisky distilleries, and breweries sprang up in Canada, as did paper factories and glass manufactories. Woolen and cotton mills also made rough fabrics; their numbers grew. Latin America: 1830: Mexico's modern textile industry started using power-driven machinery. 1850's: Brazil started a modern textile industry; c. 1863 a beef-extract plant was built in Uruguay by the Liebig Meat Extract Co. of London—probably the 1st modern factory in that country; yet throughout Latin America there was little modern industry. 1835: Turkey set up a fez-cap factory (caps of red wool), founded by Sultan Mahmud; other government-sponsored manufacturing enterprises in Turkey included cloth, paper, and glass factories, a foundry and forge were established in Constantinople, which used English engineers, mechanics, materials, and machines. 1838: By an Anglo-Turkish Convention foreign traders were allowed to buy and sell anywhere within the Ottoman Empire, including Egypt;

competition from foreign goods was too much for Egypt's infant industry, which mostly collapsed. Throughout the Ottoman Empire, handicraft manufacturing slumped because of competition from cheap British-manufactured goods. The pressure of imports retarded industrialization in this case. India: 1830's: Rapid decline of native cotton textile industries and crafts with influx of British products. Imports stimulated industrialization. 1854: Parsi merchant Cowasjee Nanabhoy Davar (b. 1815) established the Bombay Spinning and Weaving Mill, marking the start of the modern steam-powered cotton textile industry in India; the capital was Indian and British; the machinery, technicians, and management were all British. 1855: Manufacture of jute on a large scale started at Rishra, near Serampore, India; the machinery, technicians, and management were British; here the stimulus was not imports but potential export demand. 1859: 1st power loom used in jute industry at Barnagore, near Calcutta. Japan: Rural industries manufacturing cotton and silk proliferated. 1854 ff.. After the opening of Japan to the West, the shogun started ironworks and other industrial plants along western lines; both the central government and the daimyo (provincial lords) established arms manufactories along western lines. Foreign advisers were brought in to offer their skills. 1859 ff.: Imports of cheap British machine-made cotton textiles began to disrupt the existing Japanese cotton textile industry. 1863: Prince H. Shimazu at Kagoshima, with the aid of an English engineer, started Japan's 1st cotton spinning by machinery. 1868: After the Meiji Restoration, Japan became fully committed to industrialization. 1870: The Japanese government established factories for silk reeling, following the French and Italian model. Early modern industry in China was in armaments; 1855: Tseng Kuo-fan (1811-72) established small arsenals in Kiangsi; others followed.

TRANSPORTATION. Everywhere in the less developed world transportation was inadequate. Yet it was primarily changes in transportation that created

basic conditions for economic growth in much of that world. Commercialization of agriculture depended on transportation; raw material utilization rested on transportation; urbanization and transportation went hand and hand. Innovations in transport, more than in industry, brought steam power to most of the less developed world. Industry would in some cases be stimulated later by the growth of transportation links (in Canada, for instance), but it was also hampered, for cheap machine-made British goods, carried by new means of transport, often put artisan industries out of business. The development of transportation facilities brought foreign capital to less developed nations. Transportation was the basis for the expansion of foreign trade. In these years, only preliminary steps were taken in the transportation revolution.

Roads: Within most less developed countries, roads were inadequate, yet some changes took place. 1834 ff.: Substantial improvements were made on the road from Cairo to Suez, which connected the Red Sea to the Nile. Under Lord Dalhousie, gov. gen. of India, 1848-54, trunk roads for wheeled traffic began to be built in India; it was found that 1st-class roads were almost as expensive to build as railroads, and while the latter brought returns to the builder, the former did not. 1830: There was only a single trunk road into the interior of Java; by 1847, owing to the labor due the Dutch under the "culture system," Java had fine roads and bridges. In Australia, under the influence of Thomas Mitchell and Britisher David Lennox, a student of Thomas Telford, road building made progress; travelers used vehicles that often managed in part without roads. One such was the "bush coach," made and driven by Cobb & Co.; by 1870 Cobb & Co. harnessed 6,000 horses per day and their coaches went 28,000 miles a week.

Inland waterways: Rivers continued to provide important transportation routes in less developed countries. 1852: The Yellow River (a main transportation route in China) broke loose with great damage. Rivers were more important

than canals in the less developed countries. "The Age of the Canal"—so significant in the history of transportation in Great Britain, the U.S., France, and on the Continent—was generally bypassed by less developed nations. Canada offered a major exception to this; 1830-40: canal building flourished in Canada. In India canals built for irrigation were used on occasion for navigation; the Godavari Canal was considered an excellent means of transport; but the irrigation canals, except in the deltas of the rivers, were in general not successful for commerce. The Grand Canal in China continued as an important transport route, but it was hardly a "modern" canal; moreover, the accumulation of silt in the canal made it less suitable for grain transport. Steam slowly made an impact. 1830's: Steamers in Canada regularly plied the rivers. 1839, 1842: 4 British steamers, belonging to the East India Co., sailed up and down the Tigris, the Euphrates, and the Karun, surveying the rivers and carrying passengers and mail; 1860: Britishers obtained rights of navigation and rights for a mail service between Baghdad and Basrah; 1861: the Euphrates and Tigris Steam Navigation Co., Ltd. (British-owned), was incorporated to start a steamship service on both rivers. 1830's, 1840's and 1850's: Latin American countries gave concessions for steam navigation of various rivers; 1837: Brazil introduced regular steamship services along the Atlantic coast and on the Amazon; navigation was restricted to Brazilian ships. 1849: Cornelius Vanderbilt (1794-1877), American steamboat tycoon, got a concession from the Nicaraguan government to provide transit across Nicaragua by canal or carriage road and steamboat; he chose the latter means. 1867: The Amazon was opened to navigation by steamers of all nations. 1841-42: Mohammed Ali authorized the Peninsular & Oriental Co. to run 2 steamships on the Nile as well as steam tugs on the Mahmudia Canal. 1853: Francis Cadell piloted a river steamer (built in Sydney, Australia) up the Murray River; travel by steamer became common in Australia. 1862:

Shanghai Steam Navigation Co. was founded in Shanghai by American trading firm, Russell & Co., a joint venture with Chinese and American capital; it plied the Yangtze River and was important on routes along the China coast. 1866: Steamer service started in Japan between Yokohama and Nagasaki. By the late 1860's, local steam navigation companies, mainly British, were operating water routes to and into every country and major island in East Asia from Burma to Japan. By 1868 the Japanese owned 138 western-type steamships, either imported or built in Japan. Slowly, the steamboat became more in evidence on rivers and lakes around the world, yet it was by no means the typical means of water transport in less developed nations.

Railways: 1830's: Canada and Russia started railroad construction. 1836: St. Johns, Quebec, had 1st Canadian railroad, with horse traction, replaced by steam locomotion in 1837. 1836: 1st railroad completed in Russia, St. Petersburg to Tsarkoe-Selo, but only after Russia's defeat in the Crimean War did railroad construction accelerate. 1837: 1st Cuban railroad built. 1840's: Railroad construction began in Asia. 1845: British cos were established in India to build railroad lines from Calcutta to Raniganj (coal fields) and from Bombay to the cotton-growing districts (1853: 1st 20 miles of the Great Peninsula Line opened, Bombay to Thana; 1854: 1st part of the East Indian Railroad, Calcutta to Raniganj, opened). 1848: 1st railroad in Spain. 1848-55: Construction of Panama Railroad, by U.S. capital, connecting the Atlantic and the Pacific (opened for passenger traffic, 1851); 1849-52: construction in Chile of 1st railroad from coal-mining town of Copiapo to coast (opened 1851; built by American William Wheelwright and financed by British capital). 1850's: 1st railroads in Africa and Oceania. 1853: 1st railroad in Egypt from Alexandria to Kafr al-Zayyat was completed (1856: extended to Cairo; 1858: Cairo linked by rail to Suez). 1854: 1st railroad in Australia opened, near Melbourne, and 1st railroad in Brazil started

operations (9 mi.) from Rio to Petropolis. 1856-66: European capital built 1st Turkish railroad, Smyrna to Aydin (opened 1860). 1857: 1st Argentine railroad opened (6 mi. of track from Buenos Aires to San José de Flores). 1860: 1st railroad opened in Cape Colony, South Africa. 1863. 1st railroad in New Zealand, Christchurch to Ferrymead, started operations. 1865: Railroad system started in Ceylon.

RAILROADS IN THE LESS DEVELOPED WORLD,
1870
(000 mi.)

Russia	7.0
India	5.0
Canada	2.5
Latin America	2.4
Africa	1.1
Oceania	1.1
Asia (excl. India and Russia)	0.1

In most of the less developed world (exceptions were Canada, and to a small extent Russia), all rails and locomotives for the railroads had to be imported. Railroad construction, which stimulated heavy industry in Great Britain, U.S., Belgium, France, and Germany, did not have that effect in most of the less developed world.

Transoceanic travel: Steamship connections between less developed countries and Europe meant greater foreign trade, more immigration to areas of new settlement, and the spread of technology, skills, know-how, and capital. 1833: Canadian-built steamship, the *Royal William*, steamed across the Atlantic; she, like other transoceanic steamers before her, used sail as well as steam.

FINANCE. Capital in less developed nations was scarce. Modern financial institutions were often absent. Yet they began to develop, some were indigenous, some were based on foreign investment. 1860: State Bank founded in Russia (it was not a bank of issue, paper currency was issued by the State Printing Office, on the basis of an 1843 law); 1864: 1st joint-stock commercial bank was founded in Russia—the St. Petersburg Private Com-

mercial Bank. 1841: Savings banks were legislated for in Russia, but by 1862 only 2 savings banks existed in that country. In Canada there was a broad development of banking facilities. This was the case also in Australia. In Latin America, 1851, the 2nd Bank of Brazil was founded with sole right of issue, 1864: financial panic in Brazil; while the Bank of Brazil survived, the right of issue was transferred to the Treasury. In Argentina, 1862-68, under Bartolomé Mitre's government, a national credit bank was founded and foreign banks were welcomed. Banking in Latin America was in its infancy. Middle East: 1846: English private banking firms had established themselves in every Mediterranean port (40 of them) between Gibraltar to Jerusalem, 1848: there were 7 British bankers in Alexandria. 1850's: Growth of foreign banking activities in Egypt. 1855: The Bank of Egypt was established in Alexandria with British capital. 1856: The Ottoman Bank was founded in Constantinople, with British capital. There were in India several kinds of "European" banks—the Presidency Banks of Bengal, Bombay, and Madras, which were to a limited extent government banks, 1862: the Presidency Banks were deprived of their privilege of note issue. In the mid-19th cent. joint-stock co. banks started under both European and Indian management, the rate of failure of both was high. 1850's: Growth of foreign branch banking activities in India. 1870: Post Office Savings Bank started. Banking by Indian bankers charging excessive rates of interest also continued, it was often difficult to distinguish between the banking, trading, and moneylending functions of the Indian banker. After the opening of 5 treaty ports in China in 1842, financial institutions were needed to handle expanding trade. Chinese banks had never financed foreign commerce, foreign banks filled the gap. 1845. The British-owned Oriental Banking Corporation started a branch in Hong Kong and in 1848 in Shanghai; this was the 1st foreign bank in China. 1848-72: A dozen foreign banks opened branches in Shanghai, among them 2 key British banks: the Chartered

Bank of India, Australia, and China (chartered in 1853) and the Hong Kong and Shanghai Banking Corporation (est. in Hong Kong in 1864 by British, German, American, Persian, and Chinese merchants; 1865: branch in Shanghai; in time this bank became all British-owned and the largest bank in China). Shanghai became the capital market of China. The foreign banking houses financed Chinese merchants and Chinese banks as well as foreign trade. Japan: While Japan had a history of considerable financial expertise, by the time of the Meiji Restoration the country as yet had no national banking institutions. Locally, however, Japanese merchants, serving as bankers, did channel funds into profitable ventures. Japan had an exceptionally high rate of savings and investment. Japan was by 1870 probably more accustomed to money than any other nation in the less developed world.

FOREIGN TRADE. Commodity exports from underdeveloped nations rose as railroads penetrated the interiors of less developed lands, as steam travel replaced sail, and as the demand for imports increased in the more developed nations, especially Britain. Industrializing nations sought out new markets the world over. World commerce, including the trade of industrializing and less developed nations, rose dramatically.

WORLD TRADE (EXPORTS PLUS IMPORTS)
(\$ billion)

1830	1.9
1840	2.7
1850	4.0
1860	7.2
1870	10.6

There are no available figures indicating what percentage of this trade involved less developed countries and what percentage was among more developed countries, from qualitative evidence, it seems likely that during 1830-70 a growing volume came to involve the less developed lands. New treaties aided the expansion of trade. Britain made treaties with less developed nations, obtaining trading privileges; other industrializing

nations followed Britain's lead, making their own treaties. Such agreements came to be known as the "unequal treaties" (pp. 68-72, 78-80 above). As new areas were opened to trade, commodities from new locales entered into trade and existing commerce expanded. 1830: Exports of nitrates from Chile began (but, 1830-70, copper was Chile's most important export in terms of value); 1830's ff.: wool had become the key item in Australian trade; coffee from Ceylon, Java, and also Brazil took on new significance; opium, carried on British ships from India to China, became important in trade; tea exports from China mounted (there existed a triangular trade involving Britain-India-China). 1838: the regular export of raw jute from India began. 1840 ff.: Egypt became an export oriented economy with raw cotton the major export; 1846 ff.: after the repeal of the British corn laws grain exports from Canada started to mount (Forest products were still the most important export from the Canadian colonies). 1850-60: The value of Australian wool exports doubled (1851: Australia became the world's largest exporter of wool); the export of palm oil from West Africa increased from 30,000 tons, 1851, to over 50,000 tons, 1860, palm oil had become West Africa's major export, the groundnut trade also became important in West Africa's export trade 1854-55: During the Crimean War Indian jute replaced Russian supplies of flax and hemp in the British market. 1856: Tea became for the 1st time an important item in Indian trade. (China was still the largest supplier of tea for Britain, the British plantations in India and Ceylon were just getting established.) 1857: New Zealand had become a major exporter of wool. 1858 ff.: Raw silk became an important export from Japan. 1860-65: Boom in raw cotton exports from Egypt, India, and Brazil, because of the curtailment of U.S. exports during the American Civil War. 1861: Agricultural exports from Canada for the 1st time exceeded forest exports. 1870: Sugar had become the most important item in the trade from the Dutch East Indies, representing 45% of all exports

(coffee represented 43%). For the most part the newer commodities from less developed countries engaged in foreign trade were agricultural. Precious metals in terms of their value were also important in commerce. Industrial minerals were not yet significant in international trade. The expansion of foreign commerce brought less developed nations into closer contact with the industrializing nations. Because in most cases the less developed countries did not provide the banking facilities, the insurance, the shipping, and the marketing of their exports, they did not reap the maximum benefits from this trade.

FOREIGN INVESTMENT. Investment by Europeans in less developed countries included stakes in (1) plantations, (2) railroads, (3) banking, (4) mining, (5) trade, as well as loans to the less developed nations. There were isolated investments in manufacturing.

BUSINESS ORGANIZATION. In most countries the conditions described as applicable during 1760–1830 were still in force. But there also began to develop “dual organizations” in many less developed nations. On the one hand, there was traditional, local handicraft industry, established on a family basis. On the other hand, foreign business organizations operated in these countries. Some of these latter were family firms (trading houses), but many were large-scale concerns creating efficient enclave enterprises. Local and foreign businesses meshed in different fashions. In many areas, foreign business provided capital, management, and machinery as well as marketing, while the local contribution was only labor. In India, the managing-agency system developed. At first managing agents were exclusively British. They promoted new industries, found financing for existing industries, and offered management for companies. In return, they were paid a commission based on production, sale, or profit of the business. Contracts with managing agents assured a commission, even if the firm suffered a loss. The managing agent provided a means of by-passing the traditional caste-structured society, which forbade many

castes in India to engage in industrial activity. In China, before the opening of the treaty ports, all foreign transactions went through the Chinese Hong merchants' monopoly; by 1836 their monopoly had fallen apart. Instead, the comprador system developed; foreign firms employed on contract a comprador to handle the Chinese side of the business (hiring of the Chinese staff and work force, dealing with Chinese merchants, buying and selling). 1831 and 1843: In Japan (before the opening of foreign trade), the shogun abolished by decree all forms of guilds; the effect was so disrupting that in 1851 the government attempted to recreate the guilds; this proved impossible and monopolistic privileges were to be swept away. After the opening of Japan, Japanese business enterprises developed rapidly. Although they used foreign technicians, methods, and machinery, there was no direct domination of Japanese business by foreign capital. In most of the less developed world, entrepreneurship was absent, though there were exceptions. In Canada and Australia, there is evidence of business entrepreneurship. There were some striking examples of entrepreneurship in Latin America. Irineu Evangelista de Souza, Baron of Mauá (1813–89) in Brazil, built roads, canals, railroads, and ports, he invested in shipping; laid telegraph lines; introduced gaslighting in Rio de Janeiro; built textile mills, and owned and operated huge acreages of farm land in Brazil, Uruguay, and Argentina; he organized joint-stock cos. for his ventures, and from 1850–75 (until the financial crash which ruined him) dominated the Brazilian money market. In India, Parsi and Bhatia merchants were key to developing the modern textile industry, because they were not restrained by caste restrictions and taboos. In China, entrepreneurship seemed stifled by governmental bureaucracy, yet the compradores came in time to be transformed into independent entrepreneurs. In Southeast Asia, Chinese immigrants were an important entrepreneurial group. More than anywhere in the East entrepreneurship began to flourish in Japan.

Minomura Rizaemon (1821-77) started as a poor orphan and rose to be general manager of Japan's leading commercial house, Mitsui (founded in the 17th cent. in sake brewing, Mitsui had branched into commerce and banking); Minomura handled Mitsui's relations with the shogunate, and then after the Meiji Restoration undertook banking for the new government. 1860's Iwasaki Yataro, founder of Mitsubishi, started his career as a leading business entrepreneur. Okura Kihachiro (1837-1928) traded rifles before the Restoration and later went to Tokyo, entering into foreign trade and then into industry. Sumitomo (tracing its origins to the 17th cent.) was another Japanese firm (in copper mining) that later became important.

GOVERNMENT POLICY. The role of government in economic development was still not an important factor in most of the less developed world. That the Ottoman Empire, China, Japan, Siam, and Burma had given up their rights to control their tariffs meant that they had lost a vital instrument for protecting industry and developing fiscal policy; this retarded industrialization. Japan found alternative methods of development and of gaining revenue, the Ottoman Empire, China, Siam, and Burma did not. Throughout the less developed world (with the exception of Japan), governments did not take leadership in industrialization. In Russia the government, frightened by defeat in the Crimean War, was desirous of strengthening the country. Basic reforms were made 1861: the manor was abolished by imperial decree; serfdom was ended. Yet in the 1860's the Russian government was not committed to industrialization. In Latin America political instability retarded economic growth. In the Ottoman Empire, and also in China, government bureaucracy, inefficiency, and corruption held back development. In India, Great Britain acted to develop the nation as a supplier of raw materials. The British government brought order to much of India, but 40% of the country was left to the personal rule of India's princes.

The British decided not to act in the sphere of religion; thus one of the factors that was retarding economic development in the country continued to operate. The British did bring public health measures and more education. They arranged for railroads built by private companies to be given land free, a guarantee of 5% interest on the capital, and they were to share with the government any profit over the 5%. The government kept close control over the railroads since it had provided the guarantees. Japan was the only less developed nation where the government took the leadership in industrialization. Even before the Meiji Restoration, 1868, the shogun and the damyo played an affirmative role, after it, the government acted in an even more positive fashion. The 1867 Confederation of Canada and the 1868 Restoration in Japan provided a base for national unity in each country, aiding economic development.

OTHER FACTORS. Throughout the less developed world inertia, tradition, custom, and existing institutions retarded growth. With the exception of the newly settled countries and of Japan, and with some other minor exceptions, change was regarded with suspicion and distrust. In Latin America, preoccupation with political problems left little time for economic planning or forethought. In Africa most of traditional society remained little altered. Wars, rebellions, and political instability throughout much of the less developed world held back development. 1848-65. The Taiping Rebellion in China impeded industrialization. Practically everywhere in the less developed world, the extended family played an important role in retarding change; for the successful, saving was often impossible because of the nature of the family commitment. Yet the diffusion of the technology, ideas, and institutions of the industrializing countries was taking place. In Australia and Canada all 3 took hold. Japan by the 1850's, if not earlier, showed a propensity to accept innovation. Where the social structure of countries tended to be rigid, the impact of industrializing nations was less. In Australia and

Canada, the newness of the nations made for receptivity. In Japan, while status depended on birth, there was an acceptance of a potential in individuals; personal achievement was recognized, the divisions between samurai and commoner were becoming less sharp as samurai became entrepreneurs or as they were linked by marriage to merchant families.

This flexibility in social structure made Japan more adaptable to ideas from the West. The size of nations affected the receptivity to change. Where nations were large, where there was no political unity or interdependence, where isolation prevailed, the degree of industrialization was slight.

1870-1919

The Drive Toward Maturity—U.S., Britain, and Western Europe

During the years from 1870 to the end of World War I, certain countries—the U.S., Britain, France, Germany, and some other parts of Western Europe achieved the status of "mature industrial societies."

AGRICULTURE. The percentage of gainfully occupied labor participating in agriculture, forestry, and fishing showed a marked decline in every industrial nation. In the U.S., although agriculture became relatively less important, there was significant expansion in agricultural output.

% GAINFULLY OCCUPIED LABOR FORCE IN AGRICULTURE

	U.K.	Germany	U.S.	Fran
1870-79	15	47	52	53
1880-89	12	42	50	48
1890-99	10	36	42	49
1900-09	9	34	37	42
1910-19	8	n.a.	31	n.a.

NOTE: Data represent a year or an average of the available years within the time period. N.a. = not available.

U.S. FARMING, 1870-1920

	Indexes of Output (1917-19 = 100)	Improved Land (000 acres)
1870	23	188,922
1880	37	284,771
1890	43	357,617
1900	56	414,451
1910	61	478,452
1920	70	505,023

1870-96. American agricultural expansion took place despite the drop in farm prices, 1896-1914. The price index moved upward, and then in 1914-20 prices soared. American agricultural output continued to grow.

FARM PRODUCTS, U.S. WHOLESALE PRICE INDEX 1910-11 = 100

1880	80
1890	71
1896	56
1910	100
1920	211

America was an exporter not an importer of food products. British agriculture followed a different course. As transportation facilities increased, cheap American and later Canadian, Argentine, Australian, Russian, and Rumanian grain began to enter Britain in quantity. No tariff barred the imports. 1876. British agriculture began to suffer, it was not competitive. 1879. A great depression began in British agriculture. 1875-1908. British wheat acreage fell by $1\frac{1}{2}$ as imports substituted for British wheat, imports of animal foodstuffs also rose; Denmark, the Netherlands, and New Zealand provided bacon, eggs, cheese, and ham for the British consumer. With the coming of refrigeration, beef from the U.S., and then Argentine beef and New Zealand lamb became competitive in Britain.

DECENNIAL IMPORT AVERAGES, GREAT BRITAIN
(\$ million at fixed prices)

	Grain	Animal Foodstuffs
1870's	170.5	123.0
1880's	210.5	185.5
1890's	290.0	316.5
1900's	310.0	464.0

By the last 2 decades of the 19th cent British agriculture had fallen to a relatively low level of significance, its decline continued. Britain imported more food than it raised, 1914. Great Britain produced only 20% of the wheat and cheese it consumed, 25% of the butter and oleomargarine, and 58% of the meat, 1914-18. The consequences of importing so much from abroad were serious during the war, and there arose widespread sentiment in England for the rehabilitation of agriculture—a policy not followed. A similar crisis threatened other countries in Western Europe. 1873-96 France was affected by the great agricultural depression; agricultural output (measured at constant prices) declined. 1881 France began to restrict the imports of foodstuffs. 1896 ff.: Agricultural expansion resumed with the recovery due partly to the upturn in prices but mainly to the impact of the

Meline protectionist tariff of 1892; thereafter, French tariffs were further raised. France, as a result, continued to be self-sufficient in bread.

GROSS FRENCH AGRICULTURAL PRODUCT
AT CONSTANT (1905-13) MARKET PRICES
(million 1905-13 francs)

	Gross Product	Geometrical Average of Annual Rate of Growth
1865-74	8,713	0.59
1875-84	8,356	-0.42
1885-94	8,326	-0.04
1895-1900	9,256	1.06
1905-14	10,265	1.04

1870-90. With improvement in sea transportation and railroad lines linking Germany with the Polish and Hungarian plains, the Russian agricultural areas, and the cornlands of Rumania, Germany began to import food. C. 1871-79 Germany shifted from a net exporter to a net importer of food. 1873-96. During the great agricultural depression, prices fell. 1879 Germany, like France, resorted to tariff protection of agriculture. German tariffs were lower than French and, unlike in France, did not result in self-sufficiency.

GERMAN AGRICULTURE
(million metric tons)

	Wheat		Rye		Barley		Oats	
	Crops	Imports	Crops	Imports	Crops	Imports	Crops	Imports
1900-04	3.90	2.03	9.66	.83	3.12	1.17	6.95	.51
1905-08	3.72	2.32	9.94	.55	3.15	1.96	7.95	.62
1911-12	4.21	2.08	11.23	.32	3.32	3.30	8.11	3.00

1861-65-90: German agricultural production (including the great agricultural depression) rose an average of 7% per year. 1880-1912: Over 4 m. acres were added to the area under main food crops in Germany, 1890-1913: German agricultural production expanded an average of 2% per annum.

Technical innovations: 1870's: In the U.S. and Europe use of wire fencing spread. 1880's: Introduction of barbed wire. American agriculture became mechanized with the introduction of the spring-

tooth harrow, after 1877, twine binder, 1878, gang plow, after 1880; giant combine harvester-thresher, 1880's; corn shucking and fodder shredding machine, 1890; corn binder, 1892, and disk harrow, after 1892. The results were large increases in yield per man. 1886: Invention of the steam tractor; 1892: 1st gasoline tractor developed. Tractors in the U.S.: 1910, 1,000, 1915, 25,000, 1920, 246,000. In the U.S. primary power on farms (other than man power) increased from estimated 1.6 hp per worker, 1870, to estimated 4.1 hp

per worker, 1920. In the U.S. the use of commercial fertilizer spread.

COMMERCIAL FERTILIZERS CONSUMED IN U.S.
(000 short tons)

1870	321
1880	753
1890	1,390
1900	2,730
1910	5,547
1920	7,176

1920: Mainly because of mechanization, agricultural productivity in the U.S. was from 2 to 6 times that of the main countries of Western Europe. 1870-1920: The more progressive of British farmers increasingly introduced agricultural machinery and commercial fertilizers. France and Germany, which had been much slower than Britain to mechanize, now did so.

AGRICULTURAL IMPLEMENTS
(000)

	<i>Threshers</i>		<i>Reapers</i>		<i>Sowing Machines</i>		<i>Steam Plows</i>
	<i>Germany</i>	<i>France</i>	<i>Germany</i>	<i>France</i>	<i>Germany</i>	<i>France</i>	<i>Germany</i>
1882	374	211	20	35	64	29	.8
1892		234		62		62	
1895	856		35		169		1.2
1907	1,436		301		290		3.0

NOTE: (Holdings using implements in Germany, number in use in France).

Unfortunately, statistics do not exist for France during 1892-1919, but after 1905 observers reported a great increase in mechanization in that country. 1911: Threshers were practically universal in France. The use of commercial fertilizers in both France and Germany spread, causing a rise in yield per acre.

Innovations in dairy industry: 1878: Introduction of centrifugal cream separator by the Swede, C. G. P. de Laval (1845-1913). 1890: Stephen Babcock in Wisconsin perfected a simple butterfat test.

New forms of agricultural enterprises: 1870's ff.: In the U.S., farmer co-operatives spread (1st co-operative was in cheesemaking in Wisconsin, 1841). In Germany (where the agricultural co-operative movement began in the 1860's), the number of agricultural societies rose rapidly. 1883: 1st agricultural co-operative founded in France; by 1914, 6,667 such societies existed with member-

ship of over 1 m. In Britain agricultural co-operatives were organized, but co-operation was slow in developing. Co-operative societies in every one of these countries got new impetus with the declining prices at the end of the 19th cent. Co-operatives offered facilities for credit, marketing, purchasing, and often joint processing.

RAW MATERIALS. Coal: Coal output of the major industrial nations expanded rapidly up to the time of World War I, and in some cases into the war. 1919. Fall of world coal production under 1913 level. The greatest percentage growth in coal production had been in the U.S., followed by Germany. The basic raw material for the early Industrial Revolution had been coal, which came from the industrializing nations. Though new sources of energy developed, coal remained essential. 1870-1919: Petroleum also became a vital industrial raw material. With the exception of the U.S.,

COAL PRODUCTION
(million metric tons)

	<i>U.K.</i>	<i>Germany</i>	<i>U.S.</i>	<i>Belgium</i>	<i>France</i>	<i>World Total</i>
1870	112.2	34.2	29.9	13.7	13.3	218
1900	228.8	149.6	244.7	23.5	33.4	767
1913	292.0	277.3	517.1	22.9	40.8	1,341
1919	233.4	210.3	505.5	18.5	22.5	1,173

petroleum was not found in quantity in the leading industrial nations. It was imported, the revolution in transportation making this possible. The U.S. was in 1st place in world petroleum production.

CRUDE-OIL PRODUCTION
(million barrels, 42 U.S. gals.)

	U.S.	World Output
1870	5.26	5.80
1900	63.62	149.14
1913	248.45	385.35
1919	378.37	555.88

Iron: The major industrial nations continued to be large consumers and producers of iron ore. 1876: The Thomas-Gilchrist process made it possible to use high-phosphorous-content iron ores in the making of steel (patented 1878). Germany thus developed the Lorraine non fields. Until c. 1900 Britain ignored her phosphorous-bearing ores, continuing to import the low-phosphorous ores from Sweden and Spain. In the U.S., the key innovation in iron-ore production was the move of the industry westward. 1909-11: Ore from the Mesabi Range (about 100 mi. long in northeast Minnesota) virtually replaced ore from the Wisconsin and Michigan fields. The growth of the steel industry stimulated iron ore mining.

Copper, lead, zinc: As electrical industries developed there were new demands for copper. Of the leading industrial nations, only the U.S. developed a major copper industry. 1883: As the Montana copper mines came into production, the U.S. surpassed Chile and became the world's leading copper producer.

PRODUCTION OF COPPER
(000 metric tons)

	U.S.	World Output
1870	13	n a
1880	27	156
1890	122	274
1900	275	497
1913	557	1,002
1919	584	1,009

1881-86 and then 1898 ff.: U.S. was the world's largest producer of lead. To 1906:

Germany was the world's leading producer of zinc. 1909 ff.: U.S. was consistently in 1st place in zinc production.

• **New processing methods:** 1877: Bessel brothers introduced flotation, a new means of mineral separation; 1886: Denver schoolteacher Carrie J. Everson patented all the essential elements of the flotation process. 1901-10: With the introduction of froths, produced mechanically with air, use of the flotation method spread. As a result, low-grade sulphide ores—copper, lead, zinc—that had not been economical to mine could now be utilized. 1887: In Glasgow, R. W. and W. Forrest and J. S. MacArthur patented a process using a dilute solution of potassium cyanide as a solvent for gold; use of the "cyanide" process spread, making recovery of gold cheaper and more thorough, thus tremendously increasing the world's gold supply. 1890: German-born British subject Ludwig Mond (1839-1909) developed a nickel-extracting process; German-born American chemist Heiman Frasch (1851-1914) patented a hot-water process of sulphur mining (1901: commercial production achieved). 1891: In the U.S. the Orford Copper Co. introduced a new process of treating nickel, the Orford nickel process. Such new methods increased the possibilities of developing new resources on a large scale.

ENERGY. The use of the steam engine for power led men to think of other more efficient means of harnessing energy. Electrical power and the internal combustion engine took on importance.

Electrical power generation: 1881: The 1st public electric power station established at Godalming, England, by Siemens Brothers. 1882: Thomas Edison's (1817-1931) system of central-station power production started. 1884: Britisher Charles A. Parsons (1854-1931) invented a practical steam turbine; it was devised to turn an electric generator, which Parsons himself designed, later. 1887, C. G. P. de Laval, Swede, and, 1898, C. G. Curtis, American, developed variations of the Parsons steam turbine. 1895: Hydroelectric power project completed at Niagara Falls—a pioneer venture in the large-scale development of electrical power.

Power transmission: 1882: Edison's central-station power plant used direct current in transmission 1885-86: Transformers were developed by William Stanley in the U.S. and Zipernowski, Deri, and Blathy in Hungary 1886: American George Westinghouse (1846-1914) produced a commercially practical transformer, which cleared the way for alternating-current electrical distribution (the main advantage of a.c. over d.c. was the efficiency of transmission) 1890's ff.: Alternating current began to triumph over direct current in America 1891: Exhibition at Frankfurt with a demonstration of the long distance over which electric power could be transmitted; this stimulated important developments in the German electrical industry 1895: Niagara Falls electric power facility used alternating current, indicating the superiority of this system over direct current. The way was set for the growth of large

centralized electric utilities in the 20th cent. The central power station with long-distance transmission and versatility as a power source replaced the isolated plant serving a single function. 1904: 1st electric locomotive built.

Internal-combustion engine: The internal-combustion engine also became an important source of power. 1876: German engineer N. A. Otto (1832-91) produced the 1st practical gas engine; 1885-86: German Gottfried Daimler (1834-1900) developed a practical internal-combustion engine, using gasoline. 1895: German Rudolf Diesel (1858-1913) invented a new variety of internal-combustion engine, burning heavy oil. While the Germans took the initiative in all 3 inventions, America, the world's largest petroleum producer, made the most dramatic applications of the internal-combustion engine.

Prime-mover capacity:

TOTAL HORSEPOWER OF ALL PRIME MOVERS IN U.S.
(million)

	Total	Auto- motives ^a	Work Animals	Fac- tories	Mines	Farms ^b	Rail- roads	Pow- ered Mer- chant Ships	Sail- ing Ves- sels	Wind- mills	Electric Central Stations
1870	16.9	—	8.7	2.4	.4	—	4.5	.6	3	0.3	—
1900	65.0	1	18.7	10.3	2.9	4.0	24.5	1.7	2	1	2.4
1920	453.4	280.9	22.4	19.4	5.1	21.4	80.2	6.5	2	2	17.0

^a Includes passenger cars, trucks, buses, and motorcycles.

^b Excludes horses and other work animals in 3rd col.

Comparable figures do not appear to exist for Great Britain, France, or Germany. The following census data probably underestimate the prime-mover capacity.

PRIME-MOVER CAPACITY
(millions hp)

Country	Total
1907 U.K.	10.7 (tot. cap.)
1907 Germany	8.7 (power prod.)
1906 France	3.5 (tot. cap.)

1870-1920: The major portion of the world's inanimate energy was produced by the U.S., Great Britain, Germany, and France.

INDUSTRY. 1870: Britain was still the leading industrial nation of the world;

1906-10: Britain trailed the U.S. and Germany. France's slow industrial development meant her percentage of world manufacturing output steadily declined. Belgium, a small nation, never had a sizable percentage of world manufacturing, although its manufacturing per capita remained high (1881: 51% of all Belgians were engaged in manufacturing—a higher percentage than in Britain, Germany, France, or the U.S.).

The age of steel: 1878: Two Englishmen, S. G. Thomas (1850-85) and his cousin Percy Gilchrist (1851-1935), introduced a process adapting the Bessemer steelmaking process for use with high-phosphorous-content iron ores. This process, which removed the phosphorous, became the basis of the development of

% DISTRIBUTION OF WORLD'S MANUFACTURING* PRODUCTION

	U.K.	U.S.	Germany	France	Belgium

1913	14.0	35.8	15.7	6.4	2.1

* NOTE Finished products, semimanufactures, as well as manufactured foodstuffs

European steelmaking. 1880 ff.: Steel production, using the Thomas-Gilchrist method applied to both the Siemens-Martin open-hearth and Bessemer processes, grew rapidly in France, Germany, Belgium, and the U.S. The open-hearth method of steel production was slower than the Bessemer process, but it produced steel almost free of nitrogen and thus more malleable; it also could use a relatively high percentage of scrap instead of pig iron. 1907 World steel output from open-hearth furnaces exceeded that from the Bessemer converters. Until the adoption of the oxygen process (in the 1950's and 1960's), the open-hearth method remained the prime technique for steelmaking. 1879 Werner von Siemens invented an electric furnace, which made possible the production of high-grade steel free from impurities. 1900, Bethlehem Steel Corp. exhibited chromium-tungsten steel at the Paris Exposition, 1901. Vanadium steels 1st developed. 1912. British metallurgist Henry Brearley invented stainless steel. The U.S. steel industry grew most dramatically. 1873 ff. Andrew Carnegie (1835-1919) devoted himself to steel production. 1901: Carnegie Steel Co.—the largest steel co. in the world—was merged into the newly formed billion-dollar corporation, U.S.

Steel. In the industrial nations most pig iron came to be converted into steel. From railroad tracks to shipbuilding, steel replaced iron. Steel opened the way to a vast new construction industry, and to a variety of new products from machine tools to consumer goods. In the 20th cent. the automobile industry became a major user of steel.

The oil industry: 1870, Jan.: Standard Oil Co. of Ohio incorporated, capitalized at \$1 m.—John D. Rockefeller (1839-1937), president (1863 John D. Rockefeller had joined Maurice B. Clark and Samuel Andrews in operating a Cleveland oil refinery, the firm was Clark, Andrews & Co.; 1865: new firm, Rockefeller & Andrews formed, the direct predecessor of Standard Oil of Ohio). 1870's: Standard Oil Co. of Ohio expanded its refining facilities, by 1879 it controlled 90-95% of the oil refined in the U.S. 1882, 2 Jan.: Standard Oil Trust Agreement—the shares of the acquired companies were transferred to a trust. 1882: Standard Oil Co. of New Jersey and Standard Oil Co. of New York were incorporated, 1889, Standard Oil Co. of Indiana formed. Shares were held by the trust. 1892, After decision by Ohio Supreme Court, 2 Mar., Standard Oil Trust was dissolved and reorganized, Standard

PIG IRON AND STEEL PRODUCTION

1870 figures include Alsace-Lorraine.

Oil of New Jersey was assigned a leading corporate role 1899: Standard Oil Co. (N.J.) was reincorporated and served as the holding and operating company for the Standard Oil group. 1900: Standard Oil Co. (N.J.) acquired the Pacific Coast Oil Co. (formed in 1879), this co. was renamed Standard Oil Co. (Calif.) in 1906. 1911: U.S. Supreme Court decision dissolved the Standard Oil Co. (N.J.) and in its place arose 34 separate companies, among them Standard Oil Co. (N.J.), Standard Oil Co. (N.Y.)—later, 1931, merged with Vacuum Oil Co. to become Socony-Vacuum, then, 1955, Socony-Mobil Oil Co. and, 1966, renamed Mobil Oil Corp., Standard Oil Co. (Ind.), Standard Oil Co. (Calif.). 1901: Oil discovered at Spindletop in Texas; start of Texas oil industry. Gulf Refining Co. of Texas formed (predecessor to Gulf Oil Corp.). 1902: The Texas Co. started (predecessor of Texaco, Inc.) America remained in 1st place in the world's petroleum industry, and in the 1870's and 1880's, U.S. refined-oil exports dominated European markets. 1880's ff.: Foreign investments in Russian oil (mainly by the French Rothschilds and the Swedish Nobel brothers—Robert, Ludwig, and Alfred) developed the Russian oil fields. 1883: Completion of railroad from the Baku oil fields to Tiflis; this made Russian oil available in Europe 1888 ff.: Standard Oil responded to the competition from Russian oil by establishing affiliates in Europe. 1880: Aeilko Jans Zijlker (1840–90), manager of the East Sumatra Tobacco Co., sent some petroleum to Batavia to be tested; 1890, May: Royal Dutch Co. came into existence to develop the Sumatra fields discovered by Zijlker. 1896: H. W. A. Deterding (1866–1939) joined Royal Dutch, and took charge of the marketing. 1896: The British firm, M. Samuel & Co. (est. 1830), traders in oil and other produce, purchased oil properties in East Borneo. 1897, 18 Oct.: Britisher Marcus Samuel (1853–1927) established the Shell Transport & Trading Co., Ltd. (named after the kerosene brand sold by his M. Samuel & Co.). 1907: Merger of Royal Dutch and Shell Transport and Trading Co.

into the Royal Dutch-Shell group. 1912: American Gasoline Co. established (name changed to Shell Oil Co. of California, 1914), as 1st entry of Royal Dutch-Shell group into the American oil business. 1870–1900: The oil industry's main product was kerosene for lighting; 1880 ff.: kerosene began to meet competition from electricity; 1900 ff.: with the automobile, the oil industry began the change-over to gasoline as its main product in the western world; kerosene was still the major export to markets east of Suez. 1914–19: Expansion of the oil industry because of the war, as vehicles powered by internal-combustion engines were used on the fronts, as oil burning ships were adopted, and as the airplane made its entry on the scene. Likewise, the tractor, more frequently used in farming, called for gasoline.

The electrical industry: 1871: Electric arc lighting perfected by Ohio inventor C. F. Brush (1849–1929). 1874: Stephen Dudley Field of New York invented the 1st electric streetcar. 1876: Alexander Graham Bell (1847–1922) patented the telephone; Elisha Gray (1835–1901) of Western Electric also patented a telephone; Edison established his laboratory at Menlo Park, N.J. 1877: Edison invented phonograph and microphone. 1879: Edison developed the 1st practical incandescent lamp; Joseph Wilson Swan (1828–1914) in England also developed a practical incandescent lamp; 1st experimental streetcar line built by Siemens and Halske for the Berlin Industrial Exhibition; Elihu Thomson (1853–1937) and Edwin J. Houston (1844–1914) designed an arc-lighting system. 1881: 1st city in the world lighted by electricity, Aurora, Ill., 1st electric railway opened in Germany for public service. 1882: American Schuyler Skaats Wheeler (1860–1923) invented an electric fan; American Henry W. Seely patented an electric iron. 1883: German Edison Co. founded (name changed to Allgemeine Electricitäts-Gesellschaft in 1887). Emil Rathenau (1838–1914) was managing director. 1885: 1st electric streetcars operated commercially in the U.S. in Baltimore, Md. 1886, 8 Jan.: Westinghouse Electric Co. incor-

porated. 1887: Edison invented a motion-picture machine. 1888: Croatian-born American inventor, Nikola Tesla (1857-1943), patented the alternating-current induction motor. (Tesla also invented new forms of dynamos, transformers, induction coils, and condensers, arc and incandescent lamps) 1889: Singer Manufacturing Co. developed an electric sewing machine. 1891: Edison obtained 1st radio patent in the U.S. 1892: General Electric Co. incorporated. C. A. Coffin (1844-1926), 1st president. 1895: 1st practical wireless telegraphy invented by Italian, G. Marconi (1874-1937). 1896: American William S. Hadaway patented an electric stove. 1897: German-born American inventor, Emile Berliner (1851-1929), developed a commercial product later called a phonograph record. 1902: American Lee De Forest (1873-1961) established the American De Forest (later United) Wireless Telegraph Co. at Jersey City, N.J., which installed for the U.S. Navy the 1st high-power naval radio station. 1903: The Siemens enterprises in Germany (the Siemens Konzern) reorganized, Siemens & Halske, which had handled all facets of the electrical business, confined itself to telephony and electrochemistry, while Siemens Schuckert Werke now dealt with heavy electrical equipment. 1906, 20 Oct.: De Forest announced his 1st 3-element vacuum tube (filament and 2-plate electrodes). 1907: Hurling Machine Co. (U.S.) developed an electric washing machine. 1913: De Forest presented the oscillating Audion, which gave him the title, "the father of radio broadcasting." 1913: Germany and the U.S. led in world output of electrical products; the British and French electrical industries lagged behind. 1914-18: With the war, the electrical industry's output in the allied countries grew dramatically. 1917: Metropolitan-Vickers acquired Westinghouse's English plant.

The automobile industry: 1875: German Siegfried Marcus made a crude but operable model of a gasoline automobile; it was never manufactured. 1885-86: Germans Gottfried Daimler and Karl Benz (1844-1929) developed practical engines and drove experimental motor-

boats, motor cycles, and cars. 1889: Panhard & Levassor in France, using Daimler and Benz patents, manufactured Daimler engines and made the 1st commercial automobiles. 1893: The Duryea car was 1st American gasoline-propelled vehicle to make a verified run. 1896: Highway Act in Great Britain repealed restrictions on self-propelled vehicles; H. J. Lawson formed England's 1st motor-car co., the Daimler Motor Car Co. (using a foreign car); Peugeot established in France. 1896, 4 June: Henry Ford (1863-1945) drove his 1st car on the streets of Detroit. 1899: Louis Renault (1877-1944) began production of the Renault car; 1900: Herbert Austin (1866-1941) in England drove his 1st model. 1903, 16 June: Ford Motor Co. incorporated. 1903: European automobile production was greater than American output. 1908, 16 Sept.: General Motors Co. formed—a holding co., promoted by William C. Durant (1861-1947). 1908-9: General Motors acquired ownership or substantial control of more than 20 American automobile and accessory companies, including Buick, Cadillac, Oldsmobile, and Oakland; 1909: GM became the largest automobile company in the world. 1908: Ford Motor Co. introduced the Model T. 1911, 8 Mar.: Ford Motor Co. (England), Ltd., formed (the successor of an English branch of the Ford Motor Co. organized in 1909). 1911, Nov.: Chevrolet Motor Co. of Michigan founded. 1913-14: Ford Motor Co. introduced the moving assembly line, the basis for mass production. 1913: Ford's Model T sales exceeded those of all General Motors products and became the greatest in the world. By 1913 American automobile production far exceeded that of all of Europe. 1913, Apr.: William Richard Morris, later Lord Nuffield (1877-1963), produced his 1st car in England, the Morris-Oxford; his aim was to rival the Model T. 1915-16: Chevrolet obtained control of the larger General Motors; 1916, 13 Oct.: General Motors Corp. formed, an operating company, which acquired the assets of General Motors Co., and in 1918 the assets of Chevrolet; the Model T Ford, however, remained the largest-selling car in the

world and the Ford Motor Co. remained the world's largest automobile company. Using interchangeable parts and the moving assembly line, the American automobile industry had taken world leadership. The French did not adopt mass production. French entrepreneurs admired quality custom-made units, and as a result the French automobile industry fell behind; similarly the German automobile industry tended to be conservative. Percival L. D. Perry (1878-1956; 1938, Lord Perry) of the Ford Motor Co. (England), Ltd., introduced American ideas of mass production to the British industry; Morris was ready to follow. But the U.S. industry surged ahead, in good part because it had economies of scale (the more units made, the cheaper the price per unit) and the American market was large enough to take advantage of these economies. The automobile industry stimulated the steel industry and also encouraged parts manufacturers, glass-makers, rubber-tire producers, electrical-equipment manufacturers, leather and leather fabric industries. The automobile industry, especially in the U.S., prompted a range of services, dealerships, repair shops, service stations, etc.

The chemical industry: 1870: Vaseline 1st produced by R. A. Chesebrough (1837-1933) in U.S. 1871: Carbon black made from natural gas in Pennsylvania and West Virginia—U.S. patent to J. Howarth and S. T. Lamb; salicylic acid synthesized from phenol by German H. Kolbe, sulphuric acid made from copper-ore roaster gases in Germany. 1872: Brunner-Mond founded in England; it became the world's largest producer of alkalies (merging into the Imperial Chemical Industries, Ltd., 1926). 1873: practical ammonia ice machine perfected by American David Boyle; Carl von Linde in Germany invented ammonia refrigeration; 1875: Raoul Pictet in France developed sulphur dioxide refrigeration. 1878: Adolf von Baeyer (1835-1917) in Germany synthesized indigo; Germany took the lead in the world in the manufacture of synthetic dyestuffs. 1879: American Ira Remsen (1846-1927) discovered saccharin. 1870's: Spread of

the use of chemical pulp for papermaking in England, and then elsewhere. 1885: American George Eastman (1854-1932) manufactured the 1st commercial film. (1888: Eastman registered the trademark "Kodak" for his new camera.) 1886: Charles Martin Hall (1863-1914), American, and Paul L. T. Héroult (1863-1914) in France independently devised means of electrolytic production of aluminum; this opened up the new field of electrochemistry. 1887: A German co., Aluminum Industrie A.G., formed to work the Héroult process at Neuhausen, Switzerland (1892, this co. was the largest producer of aluminum in the world.) 1888: Pittsburgh Reduction Co. was founded to develop the Hall process (1907, name changed to Aluminum Co. of America). The new methods of producing aluminum caused a sharp drop in price (1855, when aluminum was produced by the earlier methods, the cost was \$90 per lb., by 1892, it was \$.50 per lb.). 1889: Count Louis Marie Hilaire Bernigard de Chardonnet (1839-1924) exhibited in Paris the 1st dress made of "artificial" silk. 1880's and 1890's: The application of chemical methods to the processing of minerals spread. 1891: American Edward G. Acheson (1856-1931) 1st produced carborundum (abrasive, produced by an electrochemical process). 1901: C. von Linde in Germany made liquid oxygen. 1904: F. Stolz in Germany synthesized adrenalin. 1905: F. Rothe in Germany developed cyanamide process for nitrogen fixation; J. C. Wood in England invented safety glass. 1909: The plastic, Bakelite, 1st of the synthetic resins, was discovered by Belgian-born American chemist Leo H. Baekeland (1863-1944). 1912: Development of Haber-Bosch nitrogen fixation process in Germany. 1914: Corning Glass Works (U.S.) introduced pyrex glass. 1914: Despite innovations in the American and British chemical industry, in drugs, coal-tar dyes, and potash production, Germany led. 1914: Germany, with nitrogen fixation from cyanamide, the arc, and the Haber processes, produced 89,631 tons of nitrogen.

France	2.2

1914: Because of German and British involvement in war, the U.S. chemical industry began to develop products previously imported. 1916: U.S. gave special protection to the American chemical industry, Emergency Dye Tariff, 8 Sept. 1917, 6 Apr.: U.S. entered the war. 1917, Aug.: Alien Property Custodian in U.S. seized German chemical patents and American producers were licensed to produce under them. 1917, 1 Nov.: Union Carbide & Carbon Corp. established (later 1 May, 1957, renamed Union Carbide Corp.), a merger of 1 independent chemical companies. 1918: At war's end the American chemical industry showed new strength; the U.S. coal-tar dye industry was a product of the war; U.S. producers had developed local supplies of potash; nitrogen fixation in the U.S. had begun.

Other innovations: 1871: H. W. Bradley, Binghamton, N.Y., patented oleomargarine. 1873: Remington arms makers began to manufacture the typewriter, invented by Sholes. 1876: Melville R. Bissell, American, invented 1st workable carpet sweeper. 1878: Davton saloon-keeper James Ritty conceived the idea for a cash register. (1883: National Manufacturing Co. formed to acquire the cash-register patents; 1884, John Henry Patterson [1844-1922] obtained control of National Manufacturing Co. and changed name to National Cash Register Co.). 1884: American Herman Hollerith (1860-1929) developed a system of using punch cards to sort, tabulate, and analyze data. 1st applied to Census of 1890 (1896: Hollerith formed the Tabulating Machine Co., a predecessor company to International Business Machines) 1886: American Ottmar Mergenthaler (1854-99) patented the linotype. 1888: American William S. Burroughs invented the adding machine. 1889: American Hiram Maxim (1840-1916) designed an auto-

matic machine gun. 1895: "Cinematograph" patented in France.

TRANSPORTATION. Railroads: The railroad age reached its apogee in U.S. and Western Europe.

RAILROAD LINES
(000 mi)

	1870	1910
U.S.	52.9	240.3
U K.	15.3	23.1
Germany	12.2	38.0
France	10.8	24.2
Austria-Hungary	6.0	27.6

The vast extension of the railroad shortened distances and tremendously enhanced trade. Use of refrigerated railway cars meant meats and other perishables went into national and then international trade.

Steamships: Steamships connected domestic railroads with foreign lands. 1870's: New steamship tonnage (built and registered) exceeded for the 1st time new sailing ship tonnage. Refrigerated ocean transport came into use. 1870: U.S. shipments of chilled beef and other foodstuffs were being sent to British and other European ports. 1877: French interests experimented with shipping frozen meats from Argentina to France; 1880: 1st cargo of frozen meat sent from Australia to London. 1882: Australian mutton, beef, poultry, and fish were regularly frozen and shipped to Britain. 1892: transoceanic trade in frozen meats equaled 2 m. carcasses. 1902, 4 m. carcasses. 1885: The 1st ocean-going steam tanker for the transport of refined oil, used by the Nobels, carried 1st cargo of refined oil from Batum to Antwerp. The expansion of the railroads and steamship service put Europe and the U.S. in closer contact with the rest of the world. The opening of the Suez Canal, 1869, and the U.S.-owned Panama Canal, 1914, shortened distances.

Domestic transport (other than railroads): 1880's: Introduction of electric streetcar. The bicycle, invented earlier, was now improved. 1877: Ball bearings were presented, 1885: safety rear driving mirror was 1st marketed (invented 1876

by Englishman H. J. Lawson); 1889: Britisher John Boyd Dunlop (1840–1921) introduced pneumatic tires. 1900: 5 m. bicycles in France, 5 m. in Britain, 4 m. in Germany, and 4 m. in the U.S. Just as the bicycle industry grew, the automobile industry developed. In Europe and the U.S. the automobile began as a "toy" of the rich, but with mass production and with the Model T (introduced 1908), by 1920 in the U.S. the automobile was becoming a popular mode of conveyance.

a Estimated.

Air transport: 1903, 17 Dec.: Americans Wilbur Wright (1867–1912) and his brother Orville (1871–1948) made 1st successful airplane flight at Kitty Hawk, N.C., 1906: German Count Ferdinand von Zeppelin (1838–1917) flew 1st practical airship (dirigible) at 30 mph (passenger service began, 1910). 1908: Louis Breguet and Charles Richet built a combined helicopter and biplane, which flew 64 ft. 1912: American Glenn Hammond Curtiss (1878–1930) built 1st seaplane. 1913: U.S. total aircraft production, 43 planes. 1914 ff.: World War I provided a stimulus to the airplane industry. 1915: Dutchman Anthony H. G. Fokker (1890–1939) built for the Germans the 1st of his famous planes, with machine-gun fire through a revolving propeller. 1918: U.S. aircraft production, 14,020 planes (of which 13,991 were for military use).

COMMUNICATIONS. Cables: New cable connections linked Europe with North and South America and the Far East.

Telephones: 1876: 1st "long distance" telephone conversation, Cambridge to Boston, Mass. 1879 ff.: The telephone was introduced in Europe. 1892: Europe had 254,900 telephones; U.S., 239,300 telephones. 1898: Number of telephones in U.S. surpassed number in Europe. 1915: 1st transcontinental telephone line

opened between New York and San Francisco. 1920: 1.5 telephones per 100 persons in Europe, 12.4 telephones per 100 persons in the U.S.; the U.S. had 13 million telephones.

FINANCE. Gold and the gold standard: The financial situation worldwide was shaken by the fabulous discoveries of gold in South Africa. 1870–90: World gold production fluctuated between a low of 475 m. troy oz., 1883, and a high of 6.05 m. troy oz., 1889. 1890 ff.: Production rose rapidly. 1915: Production 22.72 m. troy oz. In that year, 40.0% of the world's gold supply came from South Africa, 21.2% from the U.S., 8.6% from Australia, and 5.6% from Russia—the leading gold producers. Even before this rise in gold production, in 1871–73 Germany adopted the gold standard and, 1873–74, so did the Latin Monetary Union (including France, Belgium, Italy, and Switzerland); 1875–76: Denmark, Norway, and Sweden followed, and, 1879, the U.S.; Britain had adopted the gold standard much earlier. By 1914 most of the world (China was a key exception) was on the gold standard. 1914–18: With the war, most participants went off the gold standard.

Banking structure: By 1870, in Britain, France, and Belgium a modern banking structure had been erected. 1875, Mar.: German Reichsbank established, based on the Prussian Bank (est. 1846); it controlled note issue throughout the empire, and carried the main cash reserves and provided banking facilities for the entire empire. 1875–1905: The Reichsbank opened nearly 100 main branches and 4,000 subbranches. In the U.S. the Federal Reserve Act, 23 Dec., 1913, established the Federal Reserve System, the 1st central banking structure in the U.S. since the expiration of the 2nd National Bank charter in 1836. Rise of investment banking in U.S. and Germany. In the U.S. investment banking houses such as Jay Cooke & Co. (failed 1873); Drexel, Morgan & Co. (J. P. Morgan & Co. after 1894); Kuhn, Loeb & Co.; Lee, Higginson & Co.; and Kidder, Peabody & Co. played important roles in financing American railroads and industries. J. P. Morgan (1837–1913), particularly, was

important in organizing, financing, and obtaining management for consolidations that took place in the U.S. in the 1890's and early 1900's. Germany developed investment banking on a grand scale. Banks of deposit were committed to building industry. 1872: 130 deposit banks in Germany; 1914: almost all the liquid savings and credit resources were in the possession of 12 banks. The major ones had become the "4 D's": the Deutsche (est. 1870), the Dresdner (1872), the Diskontogesellschaft (1851), and the Darmstadter (1853). The banks were noncompetitive, had areas of specialties, and often joined in banking syndicates to finance business expansion. In France there were the private banks (such as the Paris House of Rothschild), which participated in banking syndicates. There were the industrial banks, key among them the Banque de Paris et Pays Bas, the Banque de l'Union Parisienne, the Banque Française pour le Commerce et l'Industrie. There were also the deposit banks, including Crédit Lyonnais, Comptoir Nationale d'Escompte (failed 1889), the Société Générale, and Crédit Industriel et Commercial. The industrial and deposit banks looked in the main to foreign investment and foreign financing. The deposit banks had started for the most part as industrial banks and then stopped lending to domestic industry. French banks, unlike the German banks, did not concern themselves mainly with the foundation and supervision of domestic industrial enterprises (they tended to issue bonds rather than stock). The industrial banks, when they did finance domestic enterprise, tended to abjure responsibilities for management. Unlike the German banks, they did not take leadership in making industrial enterprises more efficient. It is frequently argued that whereas the German banks served a progressive entrepreneurial function encouraging economic growth, the French banks accepted the passive conservatism of the French people and did not stimulate the latter's industry, inventive talent, or organizing ability. Others counter that the French banks failed to aid French industry because they were

not needed. In Britain private banks were important in underwriting securities, but did not give leadership to British enterprise or control it.

Allocation of savings: In the U.S. domestic savings were practically all reinvested within the country. Capital accumulated in industries was reinvested in industries. Savings in Germany were in the main reinvested in German economic development, but there were also substantial foreign investments. In France savings tended to go into foreign rather than domestic investments in search of higher rates of return, while in Britain, c. 1875 ff., foreign lending also attracted a substantial portion of savings.

Stock exchanges: An American capital market developed. 1908: Foundation of New York Curb Agency by group of street brokers (1952, the Curb became the American Stock Exchange). The Paris Bourse (stock exchange) and the Berlin Börse were both subject to close national governmental control and supervision. 1896: German legislation severely restricted business on the Berlin exchange, to check speculation in stocks. French and German speculators transacted their business abroad, especially in London, Brussels, and Amsterdam. The London market was the greatest in the world, handling securities of nations around the globe.

FOREIGN TRADE. The foreign trade of industrial nations rose. London remained the center of world trade.

VALUE OF FOREIGN TRADE (EXPORTS PLUS IMPORTS)
(\$ million)

	1875	1913
U.K.	3,186	6,837
Germany	1,433	4,970
U.S.	1,079	4,392
France	1,430	2,953

Railroads, steamships, and refrigerated transport plus growing world population encouraged the expansion of commerce. The gold standard assured a stability of international exchange rates. The rise of new colonial empires stimulated foreign trade. Industrial nations exported manu-

factured goods and imported foodstuffs and industrial raw materials. The U.S. was the major exception to this pattern, since it was an important exporter of agricultural products. (1865-75 ff.: American grain began to reach European markets in quantity; 1880's: U.S. became an important exporter of beef and to a lesser extent pork. With the exception of isolated years, raw cotton remained the largest single U.S. export. Petroleum—refined and crude—became a significant U.S. export.) British exports of manufactured goods grew (Cotton manufactures continued as Britain's largest single export, comprising in 1913 $\frac{1}{4}$ of the volume) German exports came to compete with British products in many markets. The Germans developed a "double selling price": at home, manufacturers, protected by the tariff and through cartel arrangements, raised domestic prices, overseas, in competitive situations, German goods were often sold below cost. Multilateral trading patterns developed among European nations, Europe and Asia, and North and South America. It has been suggested that the slowing down in the pace of British economic growth at the end of the 19th cent. and start of the 20th cent. was due to the growth of foreign competition at home and in world markets.

Tariff policies. From the repeal of the corn laws to the McKenna duties, 1915, Britain remained committed to free trade. Her free-trade policy had been adopted when she was the workshop of the world. 1915, 21 Sept.: When Britain had fallen behind the U.S. and Germany in industrial productivity, when she required new revenues for wartime needs, she adopted the McKenna duties, placing duties on imports of manufactured goods; the McKenna duties also provided imperial preference. 1870-97: U.S. held to a protectionist tariff policy; although there were occasional reductions in tariff, the trend was upward: 1872, 6 June: 10% tariff reduction in U.S.; 1875, 3 Mar.: 1872 tariff reduction removed; 1883, 3 Mar.: 5% reduction in tariff; 1890, 1 Oct.: McKinley tariff raised duties to new high level, average 49.5%; this tariff had for the 1st time explicit provisions

for negotiations with other nations on reciprocal concessions; 1894, 28 Aug.: Wilson-Gorman tariff lowered duties to average 39.9%; 1897, 7 July: Dingley tariff raised level to new high, average 57%; 1909-19, moderate tariff policy in U.S., 1909, 9 Apr.: Payne-Aldrich tariff lowered duties to average of about 38%; 1913, 3 Oct.: Underwood tariff decreased levies to average of about 32%; 1916, 8 Sept.: emergency dye tariff designed to protect the new chemical industry. 1870-79: Germany reduced duties. 1873: German duties on iron and shipbuilding materials were abolished, those on iron products were lowered (eliminated, 1 Jan., 1877, but protection remained on certain manufactured goods). 1879: New German tariff raised rates on manufactured imports and also imposed duties on corn imports. The levies on manufactured goods were designed primarily for revenue rather than protection 1885 and 1888: Germany raised duties higher. In the late 1870's, agricultural imports began to flood into France, 1880's: Restrictions on imports into France, 1881: French government forbade entry of American pork 1881 France increased taxes on foreign sugar 1885, 1887. France imposed higher duties on cattle. 1885: Rye, barley, and oats imports were taxed. 1885, 1887. Flour duty raised. 1885: Import duty increased on wheat. 1890-92: General European response to the McKinley tariff in the U.S.: 1890 France raised her tariff. 1892: In France the Méline tariff raised most agricultural duties and also duties on manufactured goods 1891-1902: Germany raised some duties, but also negotiated treaties reducing key agrarian and industrial tariffs. 1902, 14 Dec.: Germany enacted a new tariff, characterized by (1) higher level of duties on foodstuffs, (2) free entry of raw materials used in manufacture, (3) low duties on partially finished manufactures, and (4) increasingly higher duties depending on how finished a manufactured product was. 1910: France further raised tariffs, but the government could negotiate tariff reductions by reciprocal agreements. The principal object of protectionism in France and Germany was to aid agriculture.

Nontariff trade restrictions such as prohibitions of imports and exports, quotas, exchange controls, and licensing did not in general exist, most such were outlawed by trade treaties. Only on occasion, e.g., in emergencies, might such restraints be imposed. 1914-18: Worldwide restrictions were introduced because of wartime needs, it was expected that after the war these would terminate. 1914, Aug.: British blockade of Germany started, other nations joined blockade 1917, 6 Oct.: U.S., Trading with the Enemy Act. 1919, 12 July: Allied blockade lifted.

FOREIGN INVESTMENT. 1875: Book value of existing British foreign investment was estimated at \$6 billion—mainly in bonds of foreign governments and railway shares and debentures. Of this about \$2.5 billion was invested in Europe and Egypt and the remainder in the U.S., India, South America, and the Dominions and colonies in that order. 1914: Book value of Britain's long-term foreign investments reached \$18.3 billion. The direction of British new capital outflows moved increasingly toward non-European countries; Britain financed new investments in Africa and Asia through liquidating older investments on the Continent. Most of the foreign investment involved construction of railroads and development of natural resources 1870-1914: British foreign investment represented a high percentage of current British savings. (1905-14: British foreign-investment outflow was over half British savings.) Britain led in overseas investment, but France too was a large foreign investor. 1850-1914: $\frac{1}{2}$ to $\frac{1}{3}$ of French savings went to foreign investments. 1914: Book value of French long-term foreign investments was estimated at \$8.7 billion. Germany devoted less of its savings to foreign investment. Yet by the 1880's it

had changed from a capital-importing to a capital-exporting nation. 1914: Book value of German foreign investments equaled \$5.6 billion. 1914: Belgium, the Netherlands, and Switzerland together had foreign investments to the extent of \$5.5 billion, while that year the U.S. (still a debtor in international accounts) had some \$3.5 billion invested abroad. The presence of the gold standard and the stability of foreign exchange rates encouraged international capital flows. Foreign investment financed foreign trade. The long-run effects of the large foreign investment on the British and French economies are controversial. It has been argued that in Britain and France, economic growth was retarded by the diversion of savings to foreign investment. On the other side, it is claimed that had there been demand for it capital would have gone to domestic use and that the slow economic growth of Britain and France was a *cause* of the capital outflow rather than an effect. It is also argued that foreign investment, by encouraging foreign trade and by the returns through dividends and interest, did pay Germany and more so the U.S., both of which devoted a smaller percentage of their savings to foreign investment than Britain and France, used most of their capital at home. This undoubtedly contributed to their growth. 1914-18: Wartime losses (including the repudiation by the Soviet government of foreign debts to international investors in the U.K., France, and Germany) came to about \$4-\$5 billion each. U.S. losses were far less. 1914: The U.S. was a debtor nation in international accounts to the extent of \$3.7 billion. 1914-18: Britain

borrowed from abroad, mainly from the U.S. 1919: The U.S. had become a creditor nation to the extent of the same \$3.7 billion and was the largest creditor nation in the world; New York replaced London as the world's financial center.

BUSINESS ORGANIZATION. Limited-liability corporations: 1914: In the U.S. and, to a smaller extent, Britain the limited-liability corporation had become the typical means of doing business not only for public utilities (including transportation) but also for industrial enterprises; in Germany and France the use of this form increased. Limited liability made it easier to attract funds; the corporate form contributed to business expansion; it provided the basis for the separation of ownership and control which came later.

Pools: Associations of otherwise independent businesses to control prices and/or apportion markets were common in the U.S. in the 1870's and 1880's. (1887: The Interstate Commerce Act forbade pooling in American railroads; 1890: Sherman Antitrust Act prohibited agreements to restrain trade; 1899: U.S. Supreme Court case, *Addyston Pipe and Steel Co. v. U.S.* [175 U.S. 211] applied the Sherman Act prohibition to pools among manufacturers.) In Britain trade associations of a voluntary nature often served the same function as pools in the U.S. In France agreements to control competition were also evident. In these countries no antipooling measures were taken.

Cartels (Europe and international): Similar to pools, but often more formal, cartels were associations of otherwise independent producers to fix production quotas, prices, and/or market territories; sometimes the German government took direct part as a participant in German cartels. Before 1877, c. 14 cartels in Germany (earliest in 1860's); 1876-77: 1st Rhenish-Westphalian coal cartel agreement. 1879: 1st German potash cartel; 1900: c. 275 cartels in Germany; there was hardly a trade without a cartel. The rational industrial organization created by a cartel was favored by German producers and the government. The cartel was most in evidence in Germany,

although there were cartels in Britain, France, and elsewhere; in Britain agreements establishing a "community of interests" between otherwise independent firms were not uncommon. Under U.S. antitrust legislation the cartel was clearly illegal in America; it was not illegal in Europe. International cartels involved American, German, French, Swiss, Canadian, British, and Dutch businesses. 1883: 1st international cartel (steel rails).

Trusts (U.S. and Europe): Stockholders deposited their stock with trustees, vesting in the latter the right to vote the stock and thus control the policies of the corporations involved. The most important American trusts were the Standard Oil Trust, est. 2 Jan., 1882, the American Cotton Oil Trust, 1884, the National Linseed Oil Trust, 1885, the Sugar Trust, 1887, and the Distillers' and Cattle Feeders' Trust (the Whisky Trust), 1887. Trusts were not incorporated and not subject to state control, they were the focus of much public opposition in the U.S. 1890, Jan.: The Whisky Trust was reorganized as a single corporation; 1891: the Sugar Trust was reorganized as a single corporation (as a result of an 1890 New York state court decision); 1892: the Standard Oil Trust was dissolved, and replaced by single corporations (as a result of 1891 Ohio state court decision). 1890, 2 July: Sherman Antitrust Act forbade "every contract, combination in the form of trust . . . in restraint of trade. . . ." 1895-1902: The trust form, described above and used as a means of combining 2 or more corporations, no longer existed in the U.S.; the term, however, had come to be loosely used to mean large conglomerations of corporate power. In Europe "trusts" were often set up to give shareholders financial returns while depriving them of voting rights; there were not the restrictions upon them that there were in the U.S.

Mergers: Large corporations became the norm in the U.S.; many were formed by mergers of existing cos. 1897-1902: 1st major wave of mergers in the U.S.; some merged units were holding cos. (a single co., holding the shares of other cos.); some were operating cos. (if in a merger the acquired corporations were

dissolved and merged into the single co., this unit became an operating co.); others combined the functions of holding and operating cos. There were in the U.S. major consolidations of financial and railway interests. Large industrial cos. in the U.S. were made possible by a joining of financial and industrial interests

Combines: What was known in the U.S. as a giant corporation generally formed by mergers, or, in the loose sense of the word, a "trust," was called a "combine" or "trust" in England and on the European Continent. 1890: Royal Dutch formed, which in time became a major European "combine." 1891: Formation in England of United Alkali, including competing alkali firms. 1895-96: Messrs. J & P Coats (thread) amalgamated with its 4 chief competitors into an important British combine 1896-1901: Large (by British standards) combines were formed for the manufacture of Portland cement, wall paper, tobacco, and various facets of the textile industries; by this time Brunner Mond had become another large British "combine." 1903 Krupp enterprises in Germany were a combine 1906: William Hesketh Lever, Viscount Leverhulme (1851-1925), used Lever Brothers, Ltd., to acquire major competitors and created in Britain the "soap combine" The "combines" in the U.S. were the largest in the world; those in Britain 2nd, Germany was fast catching up; France, for the most part, remained

a country of small business. In some usages, the word "combine" carried the connotation of combination in restraint of trade, but this was by no means the general meaning of the term.

Konzerns: A German form of organization of firms bound together by personal ties, e.g., the Siemens Konzern and the Stinnes Konzern (in steel).

Business entrepreneurs: Characteristic of America, leading business entrepreneurs were Collis P. Huntington (1821-1900), James J. Hill (1838-1916), and Edward H. Harriman (1848-1909) in railroads; Carnegie in steel; Cyrus Hall McCormick, harvesters, John D. Rockefeller, oil; James Buchanan Duke (1856-1925), tobacco; Henry Clay Frick (1849-1919), coke, Philip D. Armour (1832-1901) and Gustavus Swift (1839-1903), meat packing; Arthur Vining Davis (1867-1964), aluminum; Henry Ford, automobiles; Andrew W. Mellon (1855-1937), banking and diversified enterprises, J. P. Morgan, banking. 1880: 100 millionaires in U.S. (est.), 1916, 40,000 millionaires in U.S. (est.) Leading German entrepreneurs included Friedrich Alfred Krupp (1854-1902) and his son-in-law Gustav Krupp von Bohlen und Halbach (1870-1950), August Thyssen, and Hugo Stinnes (1870-1924) in steel; Emil Rathenau and his son Walther Rathenau (1867-1922) and Siemens in electricity. In Britain Alfred Moritz Mond, 1st Baron Melchett (1863-1930), in chemicals, Sir

Thomas Lipton (1850-1931) in tea re-tailing, and Lever in soap were key entrepreneurs, while Cecil Rhodes was an important British entrepreneur abroad.

General industry associations: 1895: In U.S., National Association of Manufacturers formed. 1916: Federation of British Industries. 1919: Confédération Générale de la Production Française established on the proposal of the minister of commerce "to contribute to the development of the productive power and export trade of France" 1919, Feb.: Reichsverband der Deutschen Industrie founded.

Scientific management: 1911: American Frederick Winslow Taylor (1856-1915) published *Principles of Scientific Management*; this and other volumes by Taylor turned attention to the problems of efficiency in job management, planning the work flow, understanding costs; Henry Lawrence Gantt (1861-1919) and Frank B. Gilbreth (1868-1924) were other American innovators in job management. 1916: In France, Henri Fayol (1841-1925) published his pioneering study of business administration, *Administration industrielle et générale*.

GOVERNMENT POLICY. Protection: Protection of and aid to agriculture became a new function of the governments of industrial nations. The French protection was most significant, but was at a cost, and food prices in France were higher than anywhere else on the Continent. 1889: The British Board of Agriculture was established "to foster and direct the farmer." 1916, 17 July: U.S. Federal Farm Loan Act, 1st step in U.S. aid to the farmer. Protection of industry occurred through tariffs in the U.S. and on the European Continent. The British, committed to a free-trade policy, did not protect their industry until 1915. Until the war emergency, there was virtually no direct aid to or participation in industry in the U.S. or Britain on the part of government. Taxes were low. (There was no income tax on corporations in the U.S. until 1909, and then the so-called "corporate excise tax" was 1% on corporate incomes.) In Germany, on the other hand, profitable private industrial enterprises were fostered by government subsidies; the German dyemakers got

subsidies for research, favorable rates on the state-owned railways, and remission of certain taxes, the German automobile industry was subsidized. German states operated state-owned mines and iron works. 1914: Prussia owned some 40 mines and 12 blast furnaces. Municipalities in Germany often owned slaughterhouses and other plants.

Aids to transportation: The U.S. government gave land grants to the railroads. 1914, 15 Aug.: The U.S. government-built-and-financed Panama Canal opened to traffic. 1875, 25 Nov.: purchase of Suez Canal Co. shares by Prime Minister Disraeli; British government later ratified his action. 1870's. French government took part in building and operating certain railroads in France 1879: Frevinet plan called for French government construction of major public works, including railroads; 1883, railroads built under the plan were in difficulty, and private operations began—although the French government retained a railroad network in southwestern France and guaranteed interest on the capital invested in other railways (railroads paid profits over a certain level to the government). 1908: French state took over the Ouest line when it was in difficulty 1870-1910: Increasing German governmental involvement in railroads; 1910: 94% of German railroads under public ownership. 1885: Germans gave government assistance to steamship services to Eastern Asia and Australia.

Involvement in other public utilities: The British, German, and French telegraph and telephone systems were under government control. In Britain the telephone monopoly belonged to the General Post Office, which initially licensed private companies 1902: The G.P.O. began to install its own telephone exchanges. 1911: G.P.O. acquired all telephones in Great Britain. In Germany telephones began as a government monopoly; the German government encouraged their introduction. 1881: 1st public telephone service opened in Paris, by private company licensed by the French government; subsequently, the French government introduced telephones; 1889: French government took over the entire telephone

system. Throughout Western Europe (Belgium, Holland, Austria, Italy) telephones came into government hands. In Britain municipal ownership of water supplies and gas enterprises grew. In Germany municipalities nationalized electric power plants, gasworks, and waterworks, joint-venture cos ("mixed ownership cos.") combined private and public ownership in electric power plants, gas works, waterworks, and traction systems; a private co would form such enterprises and the municipalities would acquire stock interests in exchange for the granting of franchises.

Involvement in education: In all the industrial nations, governments provided education facilities, which served to raise the standards of the work force. Involvement in social welfare measures moved countries away from free enterprise (This was especially true in Germany, then in Britain, but to a far less extent in the U.S.)

Aid to business abroad: The growth of colonial empires helped create conditions suitable for British, French, German, Belgian, and Dutch businesses to operate overseas. Cos. chartered to do business abroad were helped by the British, French, German, Belgian, Dutch, and U.S. governments. In their business activities within the empires, European businessmen could count on their governments' support. In the U.S., under the presidencies of McKinley, Roosevelt, and Taft, American businessmen could get aid for defense of their properties abroad, under Woodrow Wilson, there was less enthusiastic support, but in certain instances American businesses asked for and got assistance from their government.

Regulation of business: In an attempt to increase competition, the U.S. Congress passed a series of measures: 1887, 4 Feb.: Interstate Commerce Act established an Interstate Commerce Commission, America's 1st regulatory agency. 1890, 2 July: Sherman Antitrust Act (see above). 1914, 26 Sept.: Congress established the Federal Trade Commission as a powerful regulatory agency. 1914, 15 Oct.: Clayton Act enumerated unlawful restraints of trade. Comparable measures

to increase competition were not passed by the European governments. 1888-94: In Britain railroad legislation regulated the rights of railroads to change prices, which decreased rather than increased competition. In the U.S., court decisions as well as legislative acts were designed to increase competition.

The power to tax: 1913, 25 Feb.: Adoption of the 16th Amendment to the U.S. Constitution gave Congress the power to levy taxes on incomes. 1914, 15 July: France for the 1st time passed a law taxing personal incomes. 1920: Germany for the 1st time taxed personal incomes (German states earlier, 1891 ff., had introduced income taxes).

Role of government in wartime: 1914-18. In every belligerent nation, government involvement in the economy increased during World War I. Every nation imposed new taxes. 1915, Sept.: British raised taxes sharply and introduced excess-profits tax; every year during the war British taxes rose. 1916, June: Germany imposed new war taxes on profits and business turnover. 1916, French raised taxes and introduced a turnover tax. 1917, 3 Oct.: U.S. War Revenue Act imposed a graduated income tax and an excess-profits tax on corporations. Every nation issued some type of war bonds. Every belligerent nation established new government offices to deal with wartime planning, raw-material procurement, and transport of goods. 1914, 22 May: British government acquired a 51% interest (later raised to 56%) in Anglo-Persian Oil Co., which gave the British navy a major source of fuel oil. 1915, 9 Mar.: Defence of the Realm Act was designed to mobilize Britain's resources; May: British Ministry of Munitions Act placed under government control plants that could be used to produce for the war effort. By 1918 the British government was purchasing 85% of all imported foodstuffs, operated 250 munitions factories; had oil interests, held possession of railroads, coal mines, flour mills, and Irish distilleries, controlled prices on many commodities; and rationed, 14 July, sugar, meat, butter, margarine, bacon, ham, and lard. The French, likewise, introduced extensive economic controls,

taking over all the railways, making loans to manufacturers for them to convert their factories to war production, and establishing agencies for the purchase of raw materials. 1917, 28 July: U.S. established War Industries Board to co-ordinate the nation's war industries; it included agencies for purchase of raw materials. 10 Aug.: Lever Food and Fuel Control Act gave U.S. President the right to issue orders to encourage production and to control food and fuel distribution. 4 Dec.: 1st government contract signed for the government-owned nitrogen fixation plant at Muscle Shoals, Ala.—the only one of 5 different government-owned fixation plants that was in successful operation at the signing of the Armistice. 26 Dec.: President Woodrow Wilson took over the railways. 1918, 5 Apr.: War Finance Corporation created in the U.S. to finance war industries. Among the allies, joint government activities co-ordinated transport. (The Allied Maritime Transport Council was a multistate authority.) Germany took similar measures; most of the railroads were already in government hands. 1914 ff.: German War Food Administration sought to reduce German food consumption (since many imports were cut off), regulated production and distribution of foodstuffs, gave the individual states power to impose price controls (by war's end price controls covered almost all foodstuffs in nation); 1915, 25 Jan.: Germany introduced rationing. 1914 ff.: The War Raw-Material Office (Kriegs-Rohstoffabteilung—K.R.A.) regulated purchases of raw materials. 1915: German War Industry Administration started. 1915 ff.: New "War Industrial Companies" created mixed government-industry-owned companies, under the supervision of the War Industry Administration. 1916, 5 Dec.: The Hindenburg Plan enacted into law in Germany, with the goal of the complete militarization of the nation's economic life; workshops could be compelled to produce for the war effort, unused machinery could be transferred to workshops where it would be used, workers could be kept on munitions production, and all civilian men between the

ages of 17 and 60 were drafted for war work. In every nation it was recognized that the extent of government involvement was temporary.

OTHER FACTORS. 1870: German unification had a highly favorable effect on economic growth in that country. 1870 ff.: The development of nationalism in Germany aided economic development, until the nationalism became so extreme that World War I began, the military interests of the state served to encourage industrialization. 1914–18: World War I stimulated American economic development; industries were built to meet war needs; there was no physical damage in the U.S. In Britain, France, Germany, and Belgium, the war caused major dislocation and slowed economic development. 1870–1919: The revolution in medical science raised health standards in the industrial nations and had a favorable effect on economic development.

MEASURES OF ECONOMIC GROWTH. 1870–1913: From the available statistics on economic growth it is clear that France developed slowly, falling far behind; Britain too, once the workshop of the world, now by her slow growth lost her leadership to the U.S.; the U.S. in particular and Germany, though to a far less extent, had a favorable rate of growth up to World War I.

ANNUAL GROWTH RATES: TOTAL OUTPUT

The Spread of Industrialization

During the years 1870-1919, industrialization spread into northern Italy, the Hapsburg Empire (notably Bohemia), Sweden, Denmark, Norway, Russia, Japan, Argentina, Australia, Canada, and elsewhere. Most of these regions remained primarily pastoral or agricultural, but c. 1900 in Sweden, Norway, and Denmark there was a shift from the majority of the population being in agriculture to the majority being in other occupations. The agricultural population of Bohemia-Moravia-Silesia was 50% in 1890 and 38% in 1900. Whether agriculture or livestock raising remained the dominant mode of life or whether other activities employed more men, in all of these areas the *relative* employment in agriculture and pastoral activities was declining.

AGRICULTURE. The key change in agriculture and livestock raising was due to the expansion of the railroads, which brought farm produce into international commerce. Moreover, the development of refrigerated railroad cars and ocean transport made possible shipments of meat and other perishables over distances. Steamship travel made bulky commodities easier to ship. Everywhere commercialization of agriculture and specialization spread. In all these countries (Russia excepted), productivity in agriculture or livestock raising increased. In most cases there was more mechanization of agriculture, better breeding techniques, or alternatively (in Japan) the introduction of new seeds and better fertilizers. 1901-11: In Canada machinery used on farms more than doubled. 1884: Australian H. V. McKay invented a stripper-harvester. Wheat became important to the economic growth of Argentina, Australia, Canada, and Russia. Beef became key to the prosperity of Argentina and sheep to Australia and New Zealand. Dairy products were crucial in Denmark's economic development. Japan and Russia used taxes on agriculture as the basic means

of financing industrial development. In both countries major agricultural reforms occurred. Japan: 1871: Abolition of fiefs and emergence of national taxation. 1873, July: Land-tax revision which unified revenue collection and modernized the Japanese agrarian system, it provided the government with large tax revenues, placing the burden of capital accumulation on the agricultural sector; inefficient peasants were driven into tenancy and debt (1913: 46% of land was farmed by tenant farmers); many peasants left the farms; but farm output rose, and the tax, designed to enhance agricultural efficiency as well as raise revenues, achieved its end. 1876: Land tax in Japan reduced, yet it still remained the only important source of Japanese government revenues. 1885/89-1905/14: Japanese agricultural output doubled. Russia: 1870's: Peasants formed about 4% of the Russian population. Since 1861 they were no longer serfs, but they lived in village communes, or *mir*s; no peasant could leave without communal permission. The land in the commune was subdivided into allotments among peasant households; the peasants paid redemption payments stemming from the 1861 emancipation. The peasant economy was unable to increase its productivity because its income after taxes and the redemption payments did not permit large investments. Taxes were not designed to reward efficiency. 1880's: Deterioration of position of Russian peasant; Russian government policy was to tax the peasant to obtain state revenues used to industrialize; Russian grain output per capita was less than it had been 3 decades before 1890's. Conditions worsened. 1905: Revolution in Russia accompanied by peasant uprisings. 1906, 22 Nov., and 1910, 27 June: Acts sponsored by prime minister of Russia Peter A. Stolypin (1862-1911) introduced agrarian reforms; peasants were permitted to acquire personal ownership of the land

and to swap strips of earlier allotments into a single consolidated holding, the Russian government no longer accepted the concept of household ownership, the land of peasants who left the village commune went to the head of the household, in private ownership. The way was open for the 1st time for the movement to urban areas of peasants, also for the 1st time, Russian peasants could sell their land and use the proceeds outside of agriculture. Redemption payments were ended. The acts introduced something resembling the British enclosure movement. 1907-11. More than 6 m households asked for consolidations of allotment land. Stolypin's reforms favored personal initiative. They contributed to industrial growth, since more labor was available for the factories, the reforms also temporarily relaxed the fiscal pressures on agriculture and started to create for the 1st time among the peasantry a group of consumers. After the 1917 Russian Revolution, there were major land reforms. 1917, 8 Nov. Land Decree ordered immediate partition of large estates and then division among the peasantry. 1918, 19 Feb.: Law for nationalization of the land. 1919. Soviet government attempted to establish state farms, major protests from the peasantry resulted.

Agricultural prices: 1890's: The low worldwide prices of agricultural products affected all these nations, but most of all Australia. The pastoralists faced not only low prices but labor difficulties and droughts, which sharply reduced the number of sheep.

Agricultural co-operatives: 1882: 1st successful Danish agricultural co-operative established, 1918: 90% of the Danish landowners were involved in co-operative societies, including creameries, bacon factories, butter and cattle export societies, and credit unions. Co-operative techniques developed in Denmark were copied throughout Scandinavia and in Canada and Australia. 1891: Cheese and butter factories (built in Canada in the 1880's) were reorganized on a co-operative basis by the Dominion Dairy Commissioner; co-operation spread; 1909: United Farmers of Alberta formed a co-

operative to erect its own grain elevators; 1911. Saskatchewan Co-operative Elevator Company followed. 1915: In Australia, as a result of state action, co-operative wheat pools were formed. 1880's: In the Austrian Empire, following the German model, agricultural co-operatives were started, they developed in Italy too, at first for buying supplies and then for processing and marketing fruits, vegetables, milk, and wine. In many instances, the agricultural co-operatives were inaugurated as a response to low worldwide prices.

RAW MATERIALS. The development of industrial raw materials hastened the industrialization process in many nations; improvements in transportation made raw materials more accessible. Northern Italy's industrialization utilized iron deposits around Lake Como, in the Val d'Aosta, on the island of Elba, and at Terni in Umbria, yet the nation was short of iron. Italy produced some coal, but also imported coal from Britain. Rich natural resources existed in Bohemia, Styria, Silesia, and Moravia, and these were the parts of the Austro-Hungarian Empire where industrialization took place. Because of improved transportation, the iron-ore deposits in Krivoi Rog and coking coal in the Donets Basin began to be used for Russian industrialization. 1880's: Important petroleum deposits in the Baku region were developed, and 1883 ff.: oil became a Russian export. Canada's mineral resources were increasingly discovered and developed: copper, lead, zinc, silver, nickel, asbestos, and iron. Canada had adequate coal for domestic use, although it did import some of its coal requirements. Australia had iron and coal, but the iron and steel industry in that country was in its infancy. 1871-82: Australia was the world's largest tin producer. Japan was short of iron, which it had to import; it had coal, but needed to import blending and coking coals from north China for its metallurgical industries; Japan also had copper resources. 1885/89-1905/13: Output from Japanese mines increased tenfold. Nonmineral industrial raw materials were particularly important in the economic development

of Australia: Australia had wool, which provided needed foreign exchange. Japan at first used locally grown cotton and silk as basis for its textile industry (by the 1890's, it was an importer of raw cotton). Timber exports from Russia and Sweden were important in their development.

^b 1911 (1912, 1950)

ENERGY. In the industrializing nations, the use of coal, petroleum, natural

gas, water power, and electricity spread. These nations reflected the trend in the industrial nations away from fuel wood, gas-producer wood, sawmill waste, bagasse, and other vegetable fuels toward solid and liquid fuels, natural gas, and water power (commercial sources). Norway, Sweden, Austria, Canada, and Italy had excellent water resources which could be mobilized for hydroelectric power; development was just beginning. 1911 Russia exceeded France and Germany in terms of horsepower per head of industrial population, although Russia still lagged behind Britain and the U.S. (But Russia was still mainly agricultural and in terms of horsepower per head of total population she followed the world's leaders).

INDUSTRY. Textiles: The 1st modern industry to develop in most of the industrializing countries was textiles. This was true in Italy, the Hapsburg Empire, Rus-

sia, Japan, Argentina, Australia, and Canada. The development of the silk and cotton industries was particularly important in the history of Japan. 1870 1st modern silk filature opened in Japan with a French technician as superintendent. 1883. Osaka Spinning Co. established 1st cotton mill in Japan to use modern large-scale production methods. 1885. More cotton cloth was produced in Japan than imported. C. 1896. More cotton was spun by machine than by hand. 1896 ff. modernization of the cotton industry proceeded rapidly. 1911: In cotton weaving as in spinning a modern industrial organization existed in Japan. Similarly, the silk industry developed; Japan became a major exporter of raw

silk (a semimanufactured product) and also of silk textiles. Of all the newly industrializing nations, Japan alone found in the export of cotton and silk products an important source of foreign exchange; Japan alone of the newly industrializing nations found these industries to be a leading sector. 1870. All the industrializing nations imported textile machinery. 1911: some textile machinery was made in these countries—except in Argentina and Australia, which still remained dependent on imports of machinery.

Iron and steel: Steelmaking techniques spread from Britain, Western Europe, and the U.S. to the industrializing nations. In Russia, under the aegis of government support and with the help of

foreign investment, the iron and steel industry developed dramatically; 1880's and 1890's: the small charcoal furnaces of Russia's 18th-cent. iron industry were increasingly replaced by coke-fired furnaces, mainly in the Ukraine. 1914: These new furnaces were larger than the ones in use in Germany or Britain, although smaller than those employed in the U.S. In Russia steel output rose even more rapidly than iron output. Austro-Hungarian iron and steel output also increased, as did production in Canada, Italy, and Sweden. C. 1890-1910: Start of Canadian steel industry (1914, 90%

of Canada's annual consumption of steel rails was produced within the Dominion). 1900, Apr.: William Sandford in Australia established an open-hearth furnace and turned out the 1st Australian steel (co. was Sandfords, Ltd.); 1913: Australian steel production was still negligible. 1901: Start of modern Japanese iron and steel industry with 1st production at government-owned Yawata Ironworks (founded in 1896, mainly for military purposes); before 1913, practically all iron and steel in Japan was produced by this works.

NOTE: See p. 707 for comparisons with major industrial nations.

^a Less than 10,000, but some recorded production.

^b 1901.

^c Est., c. 1912.

1914-18: During World War I the Japanese and Australian iron and steel industries grew, stimulated by the cutting off of imports. 1918: Japanese output of pig iron was .63 m. tons, and .54 m. tons of steel. 1915: Broken Hill Proprietary Co. in Australia entered into iron and steel production at Newcastle, N.S.W., Australia's 1st major iron and steel producer.

Metal-products industries: In Italy metal-products industries flourished. 1870 ff.: The Ansaldo Co., founded by Giovanni Ansaldo (1819-59) in 1852, was building steam engines, then moved into shipbuilding, construction of locomotives, munitions, and, 1914-18, Ansaldo interests began to manufacture airplanes. 1880's: In Italy other general engineering firms came into operation. 1880's and 1890's: Italian bicycle industry developed and then the automobile industry. 1899: Giovanni Agnelli (1866-1945) formed FIAT (Fabbrica Italiana Automobili Torino) to manufacture

automobiles; 1899-1907: c. 40 companies established in Italy to produce automobiles. 1908: Camillo Olivetti (1868-1943) started to make typewriters. In Russia heavy machinery industry developed rapidly, usually utilizing foreign capital; there were no automobiles or tractors or typewriters made in Russia. In Sweden, engineering industries began. Canada developed a range of metal-products industries, in heavy industries and in consumer products. Many American companies established affiliates or subsidiaries in Canada to manufacture the items they made in the U.S.; indigenous industries also emerged. 1904: Gordon M. McGregor (1873-1922) of Walkerville, Ont., in collaboration with Henry Ford, founded Ford Motor Co. of Canada, Ltd., Canada's 1st significant automobile enterprise. (1905, assembly of automobiles began; 1908, manufacture of automobiles began. Australia lagged behind, because of its less developed iron and steel indus-

try. 1914-18: Stimulation of Australian metal-products industries because of the curtailment of imports. 1917 ff.: Automobile bodies began to be made in Australia (the chassis were still imported). 1893: 1st locomotives made in Japan 1899: 1st bicycle manufactory established in Japan; it did not prosper. 1914-18: World War I cut off imports of bicycles; a Japanese bicycle industry developed; Japan became an exporter of bicycles to China, India, South Asia, New Zealand, etc. 1906: Horatio Anasagasti started to manufacture automobiles in Argentina (his enterprise was not a success).

Food-processing industries: As wheat, beef, and to a less extent sheep came from the Argentina pampas to Buenos Aires, stockyards, packing houses, and flour mills rose; the expanding food-processing industries led to the growth of Buenos Aires, stimulating the development of other industries, breweries, textile mills, shoe manufacturing, etc.; commerce in food products developed, based on the food-processing industries. Argentina flourished. 1890 ff.: Argentine beef increasingly replaced American beef in European markets. 1880's and 1890's: Denmark mechanized and reorganized her dairy industry, which became the basis for Danish prosperity. Food-processing industries in Australia and New Zealand spurred those nations' development.

Other industries: In most of the newly

industrializing nations, breweries and sugar refineries were built, early industries in the industrializing process. Also developed: petroleum refining (Russia, Canada, Japan, Argentina), paper (Russia, Canada, Japan, Italy, Austria-Hungary, Sweden), chemicals (throughout Europe, Canada, and in Japan. 1881-1913: Chemicals were Italy's major growth industry, growing an average of 11.3% per annum). Others: electrical equipment (Russia, Canada, Japan, Italy, Austria-Hungary), rubber goods (Canada, Italy, Japan, Russia), glass (Canada, Italy, Austria-Hungary, Russia, Japan, Australia, and Argentina), and cement (Russia, Canada, Italy, Austria-Hungary, Japan, Australia, and Argentina). Switzerland developed an important watch-making industry. In all of these nations, there was "import substitution," the increasing replacement by local manufacture of goods previously imported from abroad.

TRANSPORTATION. Canals: 1895: The German-constructed Kiel Canal across the Danish peninsula opened, reducing the time to get from the Baltic to the North Sea. 1901: The Austrian Chamber approved a proposal creating a network of canals, connecting the basins of the Danube. Elbe, Oder, Vistula, and Dniester.

Railroads: The age of the canal was past. Everywhere railroad construction far surpassed canal mileage.

RAILROAD LINES
(000 mi.)

	1870	1880	1890	1900	1910	1914	1920

^a Drop because of changes in territory. ^b State-owned railroads only.

1872: 1st Japanese railroad opened. 1885: Opening of Canada's 1st transcontinental railroad. 1903: Completion of the Trans-Siberian Railroad, Russia's

transcontinental. 1917, Oct.: Opening of East-West Transcontinental Railway in Australia. 1919: After war, revolution, and civil war, about 80% of the railroads

in European Russia were damaged and 60% were out of order; moreover, Russia's territorial losses deprived her of considerable railroad mileage. Railroad construction was essential to economic growth in Russia, Canada, Australia, and Argentina. Railroads decreased transportation costs and brought new regions and products into commerce; they made possible the movement of bulky commodities. They served to increase exports. In Russia and Canada the development of railroads stimulated the modern coal, iron, steel, and metallurgical industries. More slowly, in Australia, heavy industry developed, prompted in part by the railroads. By contrast, Argentina, penalized by lack of natural resources (coal and iron), did not develop heavy industries, all the materials for the Argentine railroads had to be imported. In most countries railroads extended the areas of settlement and stimulated construction industries; in Russia and Canada the construction industries were based on locally available raw materials; in Australia this was partially true, in Argentina, steel buildings were imported and not until 1908 did Argentina even have commercial production of cement.

Other overland transportation: 1877–1917: 14 fold rise in number of registered carts pulled by horses, oxen, and men in Japan was indicative of the increase in travel. Bicycles became a common mode of transport in Europe and in Japan; 1917: 1.1 m. bicycles registered in Japan. 1913: Private automobile usage in Canada was 54,000 vehicles; 1919, 342,000 (Canada in 1919 2nd only to the U.S. in private automobile usage). 1913: Private automobile usage in Italy was 20,000 vehicles; 1919, 24,000. 1913: Private automobiles in use in Russia, 7,000—all imported from abroad. 1913: C. 1,000 private automobiles in use in Japan—all imported from abroad; 1917: 3,856 automobiles registered in Japan. 1913: Figures for Australia are not available, but they were far higher than Japan; 1909–12: 2,000 Model T's were sold in Australia, plus a range of other American, British, and continental makes.

Shipping: With the exception of Argen-

tina (because of absence of raw materials) and Switzerland (because it was inland), the industrializing nations all expanded their steamship fleets.

FINANCE. Capital: Capital was short in all the newly industrializing countries, and there was considerable reliance on foreign capital. 1870's ff.: The gold standard was adopted by all; 1914: practically all abandoned it.

Banking structure: Before unification in Italy, states had had separate currency and banks of each state had rights of note issue. 1874: The Sardinian National Bank, which had grown the fastest and had $\frac{1}{3}$ more capital than all other banks of issue combined, came to act as a central bank. 1870's: Investment banks in Italy multiplied. 1893: Massive Italian bank failures, 1893, 10 Aug.: the Sardinian National Bank was renamed the Bank of Italy. 1893 ff.: Expansion of investment banking. 1895 ff.: The large Italian banks played important roles in the industrialization of Italy, serving, as in Germany, an entrepreneurial role, the banks did their banking along German lines, making long-term loans to the metallurgical, electrical, and shipping industries. 1914: There was considerable German investment in Italian banking. Italy had an established banking structure. 1897: The Russian State Bank became a bank of issue and was converted into a central bank. 1870–1900: Development of commercial banking, at 1st along British lines. 1900–1913: Growth of large banking institutions in St. Petersburg; St. Petersburg banking developed mainly along German lines. 1913: 50 joint-stock commercial banks in Russia (6 holding 55% of total liabilities); chief among them were the St. Petersburg banks, which eclipsed the Moscow banks. 1908 ff.: Foreign investment in Russian joint stock banks multiplied. (50.5% of the foreign investment was French, 37.1% German, 9% British, and 3.4% other nationalities.) Whereas in the 19th cent. Russian banks had not invested in industry because of absence of good investment opportunities, low standards of commercial honesty in the country, and inadequate capital, by 1908 ff. the joint-

stock banks were active in industrial financing. Russia also had municipal banks, mutual credit societies, and private commercial credit banks. 1890's ff.: State savings banks developed, their deposits provided funds for a Russian capital market. 1905 ff.: The number of small rural banks in Russia grew rapidly. 1908 ff.: Foreign banking houses, in addition to participating in Russian joint-stock banks, formed syndicates with the latter for financing industries, municipal services, and railroads. After the Russian Revolution, 27 Dec., 1917, banking was decreed a state monopoly, and private banks were merged into the State Bank; the name of the latter was soon changed to the National, or People's, Bank. Canada, after confederation, 1867, developed a new banking system. 1871: Canadian Bank Act established a branch banking system for the entire Dominion; by year's end there were 23 banks with 150 branches. 1914: Canada had 22 banks, with 3,000 branches. 1914: Canadian Finance Act gave Department of Finance the right to issue Dominion notes on the pledge of approved securities. 1870: Australia had a highly developed system of private banks. 1911: Commonwealth Bank established in Australia by Labour government, not as a central bank, but to compete with the private profit-making banks. 1873: National Bank established in Argentina and authorized, in conjunction with other banks, to issue notes. Foreign banking institutions were welcomed in Argentina, and English, German, and Italian banks were founded. 1872 ff.: Japanese government began to adopt western financial institutions. 1872: The National Bank Act sought to emulate American banking legislation, national banks were established. 1876: Modern private banking began; the House of Mitsui got government permission to use the word *ginko* (meaning "western-style bank") for its financial, as distinct from its commercial, activities. 1880: Yokohama Specie Bank established to deal in foreign exchange and to finance foreign trade. 1882: Bank of Japan founded, after the model of the Belgian central bank. 1890: Japanese Bank Act

(which took effect 1893) codified and unified the commercial banking system; both national and private banks became "ordinary banks." 1897 ff.: Special banks organized in Japan (their dividends guaranteed by the government) to finance agriculture, industry, transportation, and electric power. 1902: The Japanese Industrial Bank opened, modeled after the French *Crédit Mobilier*. The effective banking system aided Japan's economic development.

Stock markets: Most of the industrializing countries had stock exchanges, but none had a developed national capital market. 1908-14: Growth of the St. Petersburg stock market (but more Russian securities were quoted in Paris and Brussels than in St. Petersburg, the Paris market dealt in Russian metallurgical and construction, coal mining, and oil shares, the Brussels bourse listed Russian metallurgical companies and electric streetcar securities, the London market handled Russian oil, copper, and gold-mining stock, while the Berlin bourse dealt in electrical and chemical company shares and the Amsterdam bourse handled Russian government stock). The Moscow bourse dealt mainly in bonds issued by the government, mortgage bonds, and railroad-co. securities. 1878: Tokyo Stock Exchange opened, to be followed by exchanges in other cities; at 1st the Tokyo exchange dealt in government bonds and later in industrials; the Japanese securities markets were mainly speculative and private, until after World War II.

FOREIGN TRADE. Developing nations depended on imports of sophisticated machinery from industrial nations; some, such as Argentina and Australia, imported a wide range of basic manufactured products. For most, the growth of their exports was crucial to their development. For all, the rise of foreign trade was marked. Danish exports of dairy products aided growth, Canadian grain the Canadian economy, while Argentine meat, wheat, and wool exports created prosperity in that nation. Australian wool and meat exports spurred development. Russia was an exporter of grain, but while

her exports did finance the import of capital equipment and did cover servicing the foreign debt, and thus aided industrial development, they did so at the expense of shortages at home. 1870: Sweden, Italy, and Japan exported more primary products than manufactured goods. 1870's and 1880's: Sweden's national income rose, stimulated by timber exports; 1890's ff.: Sweden shifted from the export of timber to the export of wood pulp, lumber, and matches. 1870: Foodstuffs and raw materials constituted the bulk of Italian exports; 1881-85: 50.7% of Italian exports were semifinished or finished industrial products; 1916-20: 71.4% of Italian exports were semifinished or finished industrial products. 1870: Japan's export of raw products (industrial and foodstuffs), such as tea, seaweed, copper, gold, silver, and coal, exceeded the nation's exports of manufactures (partly or wholly finished); 1888-92: Japanese exports of manufactures (semifinished and wholly finished) exceeded that of raw products; raw silk (a semimanufactured product) was Japan's major export; 1870-93: it accounted for c. 40% of Japan's total exports. (1893-1919: Silk continued to be Japan's chief source of foreign exchange) 1894: Japan removed export tariffs on cotton yarn; 1896: Japan eliminated import tariffs on raw cotton, designed to protect domestic cotton. These measures cleared the path for Japan to become an exporter of manufactured cotton goods and an importer of raw cotton. 1897: Japan became a net exporter of cotton yarn with exports going mainly to China and Korea. (1909: Japan became a net exporter of cotton cloth.) 1898 ff.: Raw cotton for Japanese industry was imported, mainly from India (earlier the imports of cotton had been from China). 1914-19: Japanese cotton goods replaced British in eastern markets, spreading from the Far East to India, Iran, and even Africa. Cotton goods were second only to silk as Japanese exports.

Tariff policies: Practically all these nations raised tariffs to protect either agriculture or industry and sometimes both.

VALUE OF FOREIGN TRADE, 1913
(EXPORTS PLUS IMPORTS)
(\$ million)

Russia	1,491
Austria-Hungary	1,319
Italy	1,170
Canada	1,026
Argentina	1,007
Australia	755
Japan	679

In Europe, country by country, there was a return to a protectionist policy. 1874-75: Austria returned to a protectionist policy (1878, 1882, and 1887: Austria raised duties). 1877: Russia adopted a protectionist tariff. 1881: Russian tariff raised by 10%; 1885: tariff raised by 20%; 1887: new special tariffs on pig iron, steel, and machinery; 1891: Russia adopted an almost prohibitive tariff on manufactured goods; 1913: Russia had the steepest tariff on manufactured goods in the world (it had no tariff on wheat). 1878: Italy introduced a tariff devoted to protecting cotton textiles and metal products. (1887: Italian tariff raised on wheat; this tariff also increased protection for industry.) In the non-European world Argentina raised tariffs primarily for revenue rather than protection; 1877: Victoria, Australia, enacted a protective tariff and adopted protection, with duties ad valorem ranging from 30% to 45%; other Australian states followed. 1901: Federation of Australia brought customs unity and the tariff prerogative went to the Commonwealth; 1908: protective tariff adopted by the Commonwealth. 1879: Macdonald's government in Canada started the so-called "National Policy," aiming at industrial development by means of protective tariffs. 1899: End to unequal treaties in Japan; Japan obtained right to establish its own tariffs. 1899-1911: Japanese tariff rates ran between 10% and 15%, ad valorem. 1911: New Japanese tariff came into effect, adopting the policy of (1) free or low rates on industrial raw materials that could not be produced economically in Japan, (2) low duties on semimanufactured goods, (3) moderate duties on finished manufactures, and (4) high duties

on luxury products. 1914: The average tariff in Japan on dutiable imports was just under 20%; 1914-18: scarcity in Japan meant the lowering of duties. 1919: Average tariff in Japan on dutiable imports was 9%.

AVERAGE AD VALOREM TARIFF
(LEAGUE OF NATIONS CALCULATIONS
BASED ON 78 ITEMS), 1919
(%)

Argentina	26.0
Italy	17.0
Canada	15.0
Sweden	14.5
Austria-Hungary	14.0
Australia	14.0
Denmark	8.5
Switzerland	6.0

1914-18: World War I disrupted international trade, creating shortages in most of the industrializing countries.

FOREIGN INVESTMENT. The industrializing nations were net importers of foreign capital, which played a crucial role in the economic development of Russia, Argentina, Sweden, Australia, and Canada. 1896-1913: Japan borrowed heavily from abroad to meet the drain on its national budget, balance-of-payments requirements, and the needs of the domestic capital market created by the large armament costs involved in the war with Russia. Most of the foreign capital going to these nations went into government bonds and railroad securities. 1913-14: Foreign loans represented 32.2% of the Russian national debt (or the equivalent of \$1.474 billion), 56.6% of the Argentine national debt (\$357 million), 57.4% of the Canadian national debt (\$231 million), 60.3% of the Japanese national debt (\$798 million), 70.5% of the Australian national debt (\$1.163 billion), 75.3% of the Danish national debt (\$73 million), 82.2% of the Swedish national debt (\$153 million), and 93.7% of the Norwegian national debt (\$90 million). Argentine railroads were built by British capital; British capital also invested heavily in the Canadian railroads. 1914: Foreign investments represented $\frac{1}{3}$ of the capital invested in the existing 2,000 or so

industrial companies in Russia (90% of the investment in the mining industry, including petroleum, 40% in the metallurgical industries, 50% in the chemical industries, and 28% in textiles); 42.6% of the capital in the 18 chief Russian banks was foreign. In Argentina, the large meat-packing industry was dominated by British and American capital; in Canada and Australia foreign investment played a significant role in the private sector. By contrast, the impact of foreign investment in Italy was modest.

BUSINESS ORGANIZATION. The business organization forms developed in Western Europe and the U.S. extended to the industrializing countries. Joint-stock cos. with limited liability became increasingly common. 1914: Corporate capital was estimated to represent 86% of the funds invested in industrial and commercial firms in Russia; the corporation had become the typical means of doing business there. This was true elsewhere in Europe, Japan, Canada, and Australia. 1889 ff.: Canada and Australia passed antitrust measures, which were ineffective; other nations did not. 1890-1917: On the contrary, the Russian government, admiring the German example, saw advantage in large-scale and rationalized business enterprise and did not look with hostility on giant units. 1902 ff.: Cartels became common in Russia. Italy saw no need for antitrust measures. Enterprises of scale began to develop in Sweden; 1917: the Swedish Match Co., formed by Ivar Krueger (1880-1932), was a multinational enterprise. Under the Japanese government's watchful and sympathetic eye, large business units were formed in Japan; there were no antitrust measures. Of the newly industrializing countries, only Japan developed novel business forms for private enterprise (i.e., those not adopted in the leading industrial nations): the Japanese *zaibatsu* were giant enterprises, comprising a range of business activities, joined together in a group, with each co. in the group dealing with cos. within the *zaibatsu* and also with cos. exterior to the *zaibatsu*. *Zaibatsu* was often translated as "financial clique." The Meiji government had turned to Japanese families and com-

mercial houses for financial aid, and these families and houses, which came to be called *zaibatsu*, served as agents of government policy. They aided the government, and the government in turn assisted them by offering them properties at low prices and valuable contracts. The House of Mitsui was the largest *zaibatsu*; under Minomura Rizaemon, it moved into modern banking and merchandising, and then into a wide variety of industrial activities. While the Mitsui family held ownership control of the House of Mitsui, already the management was professional. 1870–71: Iwasaki Yataro (1834–1885), who was the eldest son of a peasant and who had bought the title of rural samurai, reorganized the business of the Tosa domain, and developed his own enterprise—the Mitsubishi enterprise, at first in shipping, then in marine insurance, warehousing, banking, mining, manufacturing, and shipbuilding. 1885: After Iwasaki's death, members of his family continued the enterprise. 1919: Mitsubishi cos. were in-

volved in all the above activities as well as iron and steel, general engineering, and import-export trading in general merchandise; Mitsubishi had become the 2nd largest *zaibatsu*. Sumitomo—the 3rd largest of the giant enterprises—expanded greatly after the Restoration, becoming involved in modernizing its copper mining and undertaking industrial ventures, banking, and commerce. 1880: Yasuda Zenjiro founded the 4th largest *zaibatsu*, beginning with the establishment of the Yasuda Bank; 1908: Yasuda's *zaibatsu* involved 11 banks, 3 insurance companies, 3 railroads, a construction company, and an electric power company. In the industrializing countries, entrepreneurial talent was in evidence, although often foreign businessmen were brought in to teach skills and techniques.

GOVERNMENT POLICY. In the newly industrializing countries, the government role in the economy was usually significant (Argentina is an exception). It was most significant in Russia and Japan.

AIDS TO INDUSTRY, 1870–1914

<i>Government</i>	<i>Steel and Other Heavy Industry</i>	<i>Means Employed</i>
Italy	1884: Helped start steel works at Terni	Direct involvement; tariffs
Russia	1890's: Under Sergei Witte (1849–1915), full commitment to development	Direct involvement; government orders; extension of credit; tariffs and subsidies
Japan*	1870's: Established factories in textiles, cement (1875), glass (1876), white brick (1878). 1896: Established Yawata Ironworks	Direct involvement; technical assistance; extension of credit; tariffs and subsidies
Canada	1883: Bounties to iron and steel producers; 1900: Dominion Railroad Act required that every railroad receiving national subsidies had to use rails made in Canada	Tariffs; bounties; legislation encouraging local processing of timber
Australia	1909: Bounties on iron and steel made from Australian ore. 1910: New South Wales govt. involved directly in coal mines, brickworks, metal quarries, and concrete works	Tariffs; bounties; direct involvement (in New South Wales)

* 1878: Japan raised a loan to import textile spinning machinery.

1906–14: The Russian government became less involved in industrialization and the banks assumed a large role. 1880's: The Meiji government in Japan withdrew from the field of industrial

enterprise, encouraging private enterprise to substitute for it. Nonetheless in 1914, government manufactories still employed 10% of the work force in industry.

AIDS TO TRANSPORTATION, 1870-1914

<i>Government</i>	<i>Private Railroads</i>	<i>Government-Owned Railroads</i>
Italy ^a		1884: 2/3 railroads; 1905: 7/8 railroads
Denmark	1870's ff.: Subsidized	1870's: Some; 1880's: commitment to develop state railroads
Russia		1881: Decision on national ownership and, 1881 ff., government bought up practically all privately owned railroads
Japan		1906-9: Nationalization of trunk railroads
Argentina	1850's-1907: Private capital got a guarantee of 7% return on investment in railroad construction, land for right of way, and duty-free imports of all equipment; 1907, 30 Sept., Mitre Law discontinued 7% guarantee, but railroads were given a 40-year duty exemption on all equipment and materials used on the roads	1870's and 1880's: Provincial government (Buenos Aires) built 726 mi. of railroad; 1889: sold to British co.
Canada	Subsidized	
Australia		1870's: State governments adopted policy in favor of state owned construction

^a There was also a small percentage of mixed private-government ventures in Italy.

INVOLVEMENT IN TELEGRAPH AND TELEPHONES, 1870-1914

<i>Government</i>	<i>Telegraph</i>	<i>Telephones</i>
	<i>All Government</i>	<i>Part Government</i>
Italy	Yes	1907 ff.. Purchase of private cos.
Russia	Yes	
Japan	Yes	Owned and operated
Canada		In sparsely settled communities
Australia	Yes	Owned and operated

1880's ff.: Telegraph lines on the European Continent were government owned and operated; most telephone systems, started by private enterprise, came to be

government owned and operated; Danish and Norwegian telephones remained in the private sector; in Russia telephones were not a state monopoly.

REGULATION OF BUSINESS, 1870-1914

<i>Government</i>	<i>Antitrust Legislation</i>	<i>Other Regulation</i>
Italy	None	Promotion rather than regulation
Russia	None	Promotion rather than regulation
Japan	None	Promotion rather than regulation
Argentina		1907, 30 Sept.: Mitre Law taxed railroads for the 1st time; introduced government's right to regulate railroads
Canada	1889: Act made it illegal to enter into conspiracy in "restraint of trade"—Canada's 1st such measure; 1910: Combines Investigation Act superseded 1889 legislation and authorized investigation of associations whose activities were detrimental to the public good (the act remained in force until 1919, when it was superseded by another, but only one investigation was conducted under it)	
Australia	1906: Industries Preservation Act to prevent monopolies; act was never made effective	

1914-18: With the war, government involvement increased. 1915: A Central Committee of War Industries in Russia sought to co-ordinate that nation's war effort; 22 Aug.: Central Committee for War Mobilization created in Italy. 1916: War profits tax introduced in Italy. In Canada and Australia, the state increasingly participated in economic life. 1917, Nov.: With the Russian Revolution, the Russian state assumed an entirely new role. It undertook land reform and nationalized the banks; a 27 Nov. decree gave workers control over Russian factories; 17 Dec.: church property was confiscated; 18 Dec.: decree established the Supreme Council of National Economy (*Vesenkha*).

OTHER FACTORS. Nationalism became associated with industrialization in the newly industrializing nations. Militarism, in Japan especially but also in Russia,

contributed to the growth of industry. Japanese victory over China and Russia gave that nation new industrial prowess. 1905: Russia's defeat made Russians re-examine their industrial weakness. Political unity in Italy, Japan, Canada, and Australia was an important component in the growth process. Russia, Canada, and Australia had unsettled frontiers, which had impact on economic development. As yet the Russian frontier had little effect on economic growth; the railroad had penetrated Siberia; the frontier meant the possibilities of a national market and rich resources. Wheat made the Canadian West, and the frontier gave vitality to that country; by 1914, most of Canada was settled, and the frontier could be considered "closed." In Australia the open frontier attracted new immigrants, but the growth in output was accompanied by a rise in popula-

tion, so the growth rate per capita was relatively low. The development process was uneven. There were spurts and then setbacks. 1890's: Russian economy saw rapid industrial growth; 1901-3: serious economic crisis in Russia; then, with the Revolution of 1905 and other disorders, not until 1909 did industrialization again proceed. 1870's and 1880's: Years of rapid development in Australia; 1890's: depression; 1903/01-1913/14: continuous and dramatic rise in real Australian gross domestic product. In Europe the effects of World War I were disastrous. There was a loss of men, of financial assets, and of momentum. In no country was the damage more devastating than in Russia. With the war came a disorganization of production and supply. Industrial output slumped; transportation could not meet national needs. War losses were immense. The revolutions disrupted the Russian economy. With the signing of the Brest-Litovsk Treaty, 3 Mar., 1918, Russia withdrew from the war; the economic losses under this treaty were substantial; Russia gave up large territories, which included 40% of the industry and industrial population of the former Russian Empire, 70% of the iron and steel production, and 90% of the sugar output. Civil war followed, and the Russian economy experienced new setbacks. 1914-18: In Argentina and Australia, with imports curtailed, there were shortages. In Argentina total industrial production and national income went down, while with scarcity prices rose 27%. 1913/11-1919/20: In Australia prices increased 72.6%; in constant prices there was a decline in gross domestic product. Yet in Argentina and Australia, there were import substitutions; after the war, both

countries emerged strengthened. In Japan industry developed new vigor.

MEASUREMENT OF ECONOMIC GROWTH. 1860-1914: Divergent estimates of Russian increases in aggregative national output range from 2.5% per annum (and 1% per capita) to over 3.5% per annum; in Russia the mass of the population was involved in relatively stagnant agriculture, which deflated the aggregative national output figures (1885-1913: annual rate of industrial growth in Russia estimated at 5.7%).

Economic Change in the Less Developed World

During the years 1870-1919, in Africa and Asia, nomadic peoples began to settle. Algerian nomads established villages. Yet in the Arabian peninsula, in Persia and Afghanistan, in parts of New

Guinea, and in parts of Africa, nomads still followed the way of life they had pursued for centuries.

AGRICULTURE. Most of the world continued to live by agriculture. In iso-

lated locales little disturbed the traditional patterns. And yet, increasingly, there was a breakdown of isolation, disruption, and change. With the opening of the Suez Canal, the extension of transportation facilities, and the expansion of international trade, new commercialization of agriculture was possible. The many new plantations and new crops caused change. The spread of colonization began to alter the agricultural life of less developed countries; the colonial powers' confrontation with alien patterns of land tenure and their attempts to understand, formalize, or revise these patterns created change. In many areas ideas of private property, wage labor, and cash crops were introduced on a large scale for the 1st time. In the less developed tropical areas there was primitive (subsistence), commercial (within the country), and export agriculture. Primitive agriculture still predominated in most of Africa, Asia, and parts of Latin America; it continued to be shifting or settled, to involve the most rudimentary use of tools, and to be characterized by an absence of specialization. Crop failures, famines, and often starvation continued to be the fate of masses of peoples who lived on a subsistence basis, especially in Asia. Commercial agriculture for domestic consumption was still not widespread in the less developed world, because of lack of markets. Nonetheless, as cultivation of crops for export grew, indigenous growers no longer raised their own food; they began to purchase food; their specialization stimulated domestic commercial agriculture. Likewise, colonial administrators and white settlers were part of a market economy. Urban centers in Asia, Africa, and Latin America depended on food purchases. Paid agricultural labor on plantations had money to buy food. Thus there was being created limited commercial agriculture for domestic consumption. Export agriculture of 2 kinds existed, plantation and native agriculture. Plantations in Asia and Africa were usually foreign owned and managed; in Latin America, many were foreign owned, but many were not. Plantations have been described as "en-

claves" in less developed countries; they used the most advanced knowledge and scientific techniques of the developed nations; in general they employed considerable capital; they were part of a market economy; they specialized in particular tropical export crops. They hired native wage labor. Their modern business organization was in contrast to the backwardness of the societies in which they existed.

Tropical agriculture: The years 1870-1914 were the peak period for Europeans and Americans to organize new overseas plantations. In Ceylon the British started quinine, tea, and then rubber plantations. In Malaya the British began sugar, coffee, and coconut plantations; 1895: rubber started as a large-scale plantation crop in Malaya; investors were British and Chinese. In India, British-owned or -managed tea, quinine, sugar, cotton, and jute plantations multiplied. French investors started plantations in the newly acquired French territory in Indochina. The Dutch government had, in accord with the culture system, created large estates in the Netherlands East Indies; 1870: the Dutch government introduced an Agrarian Land Law, inaugurating the "Corporation Plantation Period" in the history of the East Indies. 1873: 73% of the agricultural exports from the Netherlands East Indies came from private plantations; 19% came from Dutch government plantations; the plantations were in sugar, coffee, tea, quinine, tobacco, sisal, tapioca, oil palm, and even rice; by the turn of the cent., rubber plantations were founded. Thus the plantation system extended throughout the colonial areas of the Far East. It was the same in Africa. In tropical Africa, British, German, Belgian, and French-owned plantations became prevalent. King Leopold and then the Belgian government encouraged private investors to start plantations in the Congo. 1899: In French Equatorial Africa, the French decreed that about $\frac{2}{3}$ of the territory would be divided among some 40 French cos.; these cos. got monopoly rights over forest and other products. 1909 ff.: In place of these large concessions (many of

which were failures), the French government started to grant smaller concessions for French private rubber, coffee, banana, cocoa, and palm-oil plantations. In German East Africa, as in German West Africa, the Germans granted huge tracts of land to companies, syndicates, and individuals with large amounts of capital for them to establish sisal, coffee, rubber, cotton, cacao, tea, and banana plantations, 1903 ff.: in East Africa, where there were large areas of uncultivated, unsettled land, British investors started sisal, rubber, coffee, and tea plantations. In the Caribbean, especially Cuba, American-owned sugar plantations multiplied, and in Middle America banana plantations were created. In Brazil, coffee, sugar, cacao, tobacco, and cotton plantations continued to be owned by Brazilians. Elsewhere in Latin America, large-scale sugar plantations, owned by wealthy Latin Americans (Peruvians, Colombians, Ecuadorians, Mexicans, etc.), continued. Often the plantations in Latin America would have absentee landownership, but the absentee owner would be a Latin American rather than a European or North American. 1876-1910: In Mexico under Porfirio Díaz, lands of Indians and mestizos and communal lands (*ejidos*) increasingly went into the possession of large landowners, some of them Mexicans and some foreign; by 1910, 90% of the rural population of Mexico had no land. 1917, 31 Jan.: The new Mexican constitution was adopted; it proclaimed the principles of agrarian reform; yet large landholdings, foreign and Mexican, still persisted in Mexico. Often plantation agriculture stimulated local farming. United Fruit Co. purchased from small farmers, British planters in the West Indies bought, processed, and marketed the output of native sugar-cane growers; similarly, British plantation owners in Ceylon purchased from local tea producers. In Malaya, stimulated by the success of the large rubber plantations, natives planted the same seeds with excellent results. Plantation owners provided marketing outlets and often processing facilities for the local crop. European traders, who were not plantation owners, offered marketing

channels for peasant agriculture. British administrators in West Africa believed that the development of peasant agricultural activities was a natural growth and plantations were an artificial creation (only maintained through organized immigration or some form of compulsory labor), that native agriculture was the cheapest means of producing for export markets, and that peasant output could be increased. Thus the British in West Africa encouraged local production. Native export crops were at first raised, mixed in with traditional crops; initially, they involved no change in the method of cultivation and no new technology. Often, increases in peasant output came simply from the expansion of land under cultivation. Peasant export agriculture grew particularly in areas where there was no population pressure and where there were unused arable lands available. As indigenous farmers developed cash crops, they often came to specialize. Native agriculture for export included the rubber of the Amazon Valley (collected from wild trees by Brazilians); rubber, coffee, and cocoa from the Gold Coast; palm oil throughout British and French West Africa, groundnuts (peanuts) in Gambia and Senegal; cocoa in Guinea; timber from the Ivory Coast; cotton in Uganda, coffee in Colombia and Central America, and rice in Burma and Thailand. In short, crops that were primarily native crops in one country (rubber in Brazil, palm oil in Nigeria, coffee in Colombia, for instance) could be plantation crops in another country (rubber in Malaya, palm oil in the Belgian Congo, coffee in Brazil).

Agricultural research: The colonial powers conducted research into tropical crops and conditions of growing. The British led in establishing botanical gardens, in testing seeds, in introducing agricultural laboratories, in starting government demonstration farms, but the other colonial powers also took similar steps. Studies were made of plant diseases, of methods of obtaining higher yields, and of means of eliminating insects and parasites. The British found agricultural research a profitable proposition; foreign

plantation owners also conducted research on their own.

Temperature-zone agriculture: Most of the less developed areas were in tropical climates. In the temperate zones of the less developed regions, changes in agriculture were somewhat different. Whereas in the tropics large foreign investments were made in plantation agriculture, in the temperate areas of the less developed world, although foreign capital often was involved in the commercialization of agriculture, in trade and transportation, there was far less foreign investment in agriculture itself. When there was foreign investment, it was by settlers rather than by large impersonal plantation enterprises. In temperate zones of the less developed world, south of the Tropic of Capricorn, white settlers were common. In Southern Africa, European settlers established corn, wheat, and tobacco farms; in South-West Africa, Europeans became involved in stock raising. In the temperate areas of Latin America that were less developed—in southern Brazil, Uruguay, and south-central Chile—settlers undertook European-style farming. In southern Brazil and Uruguay, stock raising and corn and wheat farming prevailed. Chile, following Iberian-peninsula practices, developed large estates with inefficient farming, but these were owned by settlers in Chile, not foreigners. Agriculture in all these temperate zone nations was largely commercial. It involved agriculture on private property. In the less developed areas of traditional settlement above the Tropic of Cancer some changes took place in agriculture, although these regions in large part were characterized by an absence of change, by a continuation of old forms of cultivation, traditional patterns of land tenure, and subsistence agriculture. Nonetheless, in western Turkey, mechanization of agriculture began. (In Adana, for example, in the early 1900's there were in use 1,000 mowing machines, 100 steam threshers, and 110 steam plows.) Cash crops for export increased; 1884–1911: Turkish tobacco cultivation grew 3-fold (tobacco was Turkey's main export); Turkish cotton output in Adana ex-

panded from 400 tons, 1896, to 33,750 tons, 1911. In Syria (tobacco), Egypt (cotton), Iraq (dates), and Lebanon (silk), as well as wheat and barley in most of these lands, there was an expansion of cash crops for export. The extension of breeding of silkworms in Lebanon provided a basis for considerable prosperity. In general, in the 19th cent. agricultural methods did not alter, but the areas under cultivation rose, causing output to expand. In the early 20th cent. there was some introduction of improved seeds and commercial fertilizer in the Middle East countries; in Lebanon scientific research aided in preventing diseases of the silkworm. Throughout the Ottoman Empire, the substitution of private property for communal or tribal systems of land tenure began to occur. In Iran the output of cash crops rose slowly, but exports were restricted by poor transportation. 1870's ff.: In China attempts to increase areas under cultivation were made, but methods of cultivation remained unchanged. 1878–79: A famine was estimated to have destroyed between 9 to 13 m. persons in China. The Chinese had used the iron plow before Europe; now, as the West switched to steel plows and extensive mechanization, China did not change, believing in its superiority. China's tea production dropped, faced with competition from Indian tea, which was raised on large plantations; China failed to modernize her tea industry, and tea remained a peasant crop. Likewise, cotton in China was a peasant crop. 1900 ff.: Chinese silk suffered a decline, faced with Japanese competition. (Chinese farmers were unable to prevent silkworm disease, or produce as high a quality product as Japan.) Land taxes and land tenure relationships remained basically unaltered in China, although tenant farming increased. 1918: C. 50% of Chinese peasants were occupying owners, 30% tenants, and 20% owned part and leased part of their land. The unit under cultivation remained small. With population rising, in the early 20th cent., landless peasants provided a pool of cheap coolie labor for urban and rural areas (and for emigration) and also a source

of recruits for warlord armies. Productivity in Chinese agriculture showed no increase; changes in agriculture did not become aids to economic development. There was no foreign investment in Chinese agriculture.

Relocation of agricultural production:

(1) Rubber: 1876: Britisher H. A. Wickham transported rubber seeds from the Brazilian Amazon River to England; 1876-79: some 7,000 plants were raised at Kew Gardens. 1876 ff.: These plants were shipped to the Far East, replanted in government gardens, and then transplanted on plantations; in time the trees began to yield, especially in Malaya and Ceylon; the cultivation of *Hevea brasiliensis* then spread to the Netherlands East Indies. Plantation output rose rapidly in the East, and, 1914, Asian rubber output reached 52.17% of the world's production; Brazilian wild rubber production was eclipsed. (2) Cacao: 1885: 1st export of cacao from the Gold Coast, 1919: the Gold Coast produced half the world's supply. (3) Quinine: 1870's: Increasing production of plantation quinine in Java and India brought the price of quinine planted in Ceylon down to unprofitable levels. (4) Tea: 1870's: British producers of quinine in Ceylon increasingly switched to tea; 1875: barely 1,000 acres planted with tea in Ceylon; 1893: 305,000 acres of tea. (5) Coffee: 1880's: Coffee became a major crop for Colombia. 1885: Coffee cultivation—plagued by the borer beetle and leaf blight—came to an end in India (land was replanted with tea or quinine). As coffee in India and Ceylon declined, Brazilian coffee output grew. 1880-81: Brazilian coffee output 3.7 m. 60-kilo bags; 1901-02: output 16.3 m. 60-kilo bags; Brazil was the world's largest coffee producer. (6) Sisal: 1893: 1st introduced from Mexico into Africa by the Germans. (7) Opium: 1907: British government in India made an agreement with China to cut opium exports to China; this resulted in a reduction of opium cultivation in India.

Agricultural co-operatives: 1904: Co-operative Credit Societies' Act passed in India, allowing credit societies to be

formed. 1907: India had 149 co-operatives. 1912: Indian law passed allowing the formation of co-operative societies for other than credit; co-operatives were formed for seed distribution, purchase of manures and implements, cattle insurance, cotton sales, dairying, and cotton ginning; 1918: India had 26,465 co-operatives. Even so, co-operatives did not have significant impact in India—or in other parts of the less developed world.

Effects of change: The consequences of all the changes in agriculture were (1) plantation agriculture disrupted existing traditional society and demonstrated what could be done with agriculture, given sufficient capital and skill; (2) plantations in their demand for wage labor, no matter how small the wage was and no matter if they used immigrant labor, increased the monetization of the economy—an essential precondition for later economic development; (3) plantation agriculture, in that it encouraged native growers to raise and market similar crops, created profitable farming enterprises outside the foreign enclave; (4) commercialization of agriculture in the tropics and in the temperate areas brought increased monetization; (5) agricultural research, to the extent that it existed, served a useful purpose for less developed countries, (6) new crops offered new sources of revenue and more effective use of resources; (7) the agricultural co-operative movement served to spread information about scientific agriculture, and to encourage commercialization of agriculture. These were affirmative aspects of the changes. Attempts at changing or clarifying land-tenure relations seem at this point to have had no clearly positive or negative effect on economic development. What was still absent in all these less developed areas was an effective use of agricultural surpluses for economic development; this did not occur because (1) there were still limited surpluses outside of the plantation economies (which because of their foreign ownership were "capital-autonomous"), and (2) the governments of these countries did not devise fiscal policies designed to tax agriculture for

the benefit of economic development, as was done, for example, in Russia and Japan. The co-operative movement did not serve a constructive function in this respect, because of its limited impact. Likewise, in none of the less developed nations did agricultural incomes rise to the point that peasants provided a market for domestically produced industrial products. In India, China, Mexico, and Brazil, incipient industrialization seems to have been retarded by the absence of rural markets. Because a large part of the distribution of export crops was in foreign hands, the profits accrued from the trading activities did not usually go back into the countries' economy and aid their growth. But over time, Asians, Africans, and Latin Americans did participate in the trade and services, with favorable results.

RAW MATERIALS. **Diamonds and gold:** 1869: Diamonds were discovered in the Kimberley fields in South Africa; 1886: discovery of gold on the Witwatersrand in South Africa. Diamonds and gold spurred immigration to South Africa and created prosperity. Except during the Boer War, South African gold production rose steadily; 1905 ff.: South Africa was consistently the world's largest gold producer; 1913: South African gold output was 8.81 m. troy ounces. Industrial raw materials in the less developed countries were slowly coming into production, but, compared with the industrial nations, output was small.

Coal: Production in 1913 (m. metric tons): India, 14.9; China, 14.0; South Africa (Transvaal, Natal, and Cape of Good Hope.) 8.8; Mexico, 2.4 (1912). In India the new railroad lines opened the way to develop certain coal-mining areas. The coal fields in Bengal and Bihar were developed by British capital. 1895 ff.: Chinese coal attracted foreign capital; 1913: the largest producer was the Kailan Mining Administration, a British-Chinese enterprise. 1905 ff.: Japan, which lacked good coking coal, made investments in Chinese coal mining. 1914 ff.: There was considerable foreign interest in developing Chinese coal mines, but poor transportation and lack of good harbors on

the China coast hampered the export trade in coal.

Iron: The iron-ore resources of Brazil were becoming well known, but there was not much development. Iron ore was mined in India. 1905 ff.: In China, the Japanese, who had virtually no iron-ore resources, took leadership in developing Chinese iron mining with the goal of meeting Japanese needs; the 3 largest Chinese iron mines were all financed by Japanese capital. The Japanese invested in iron mining in Manchuria. Iron-ore deposits in North Africa (in Tunisia and Algeria) were developed by European capital. With extension of railroads, new minerals came into production.

Other minerals: Minerals (other than gold, coal, and iron) which provided, or would provide, substantial export industries for less developed nations included nitrates, tin, copper, and oil. (1) Nitrates: Nitrate production in Chile grew steadily; during World War I Chile was under a cloak of prosperity based on nitrate production. Nitrates had been developed mainly by British capital. (2) Tin: 1883: Malayan tin output exceeded Australian production and, 1883-1919, Malaya was 1st in worldwide production. 1889-1904: The Netherlands East Indies was in 2nd place, then, 1901-19, Bolivia held 2nd place, with the Netherlands East Indies in 3rd position. China and Thailand also became substantial producers of tin; 1903 ff.: Nigerian production of tin began, undertaken by British capital; Nigeria became an important producer. (3) Copper: 1878 ff.: Copper in Chile was a declining industry; 1880: Chile produced $\frac{1}{5}$ of the copper consumed in the world; 1882: Chile produced less than $\frac{1}{10}$ of the world's copper. In the early 1900's American investments in Chilean copper (based on new technology for processing low-grade ores) created new possibilities for that Chilean industry. 1911: Belgian capital started production in the copper mines of the Belgian Congo. 1870-1910: Mexico increased its production of copper, lead, zinc, silver, etc. 1870-1914: Turkey enlarged its production of coal, lead, emery, borax, and chrome.

Oil: While most of the world's oil came

from the U.S. and Russia (until 1917), in underdeveloped countries oil resources began to be developed. 1890: Royal Dutch started to develop oil fields in Sumatra, and other Dutch oil companies got concessions there. 1896: Samuels obtained 3 concessions in East Borneo. 1901: American Edward Doheny started to drill in Mexico; commercial oil production began; 1918: Mexican oil production surpassed Russian output and became 2nd only to U.S. output. (1918: U.S. output, 355 m. barrels; Mexican output, 63 m. barrels.) 1908: Oil was found in commercial quantities in Iran by Anglo-Persian Oil Co. 1914: Commercial oil discovered in Venezuela. The development of mineral resources on a large scale was by foreign capital. Oil production in the less developed countries was in every case financed and managed by foreign enterprises. Whereas in all the industrial and most of the industrializing nations a large percentage of the mineral resources was used domestically to supply domestic industry, in less developed countries the bulk of the mineral resources was exported to industrial nations. Non-mineral industrial resources in the less developed countries often existed in the form of raw cotton, hemp, jute, and timber. Both India and China grew cotton, which provide a basis for their early cotton industries. But by the early 1900's China was importing raw cotton for her industry.

LABOR. Mobility of labor: Demand for wage labor on the plantations and in the mines of the industrializing areas created new labor mobility. In Brazil, the new textile mills in Rio attracted wage labor. The entry of foreign labor—European, Chinese, or Indian—or the migration of African labor over considerable distances within Africa (and the mixing in the labor forces of various African tribes) represented new mobility throughout the less developed world. The continued migration of Arab traders into Africa and of Greeks, Armenians, and Syrians into Egypt was also evidence of mobility. 1878: China lifted official prohibitions on migrations of peasants from northern China to Manchuria. Slavery was being ended in most of the less developed

countries, although it still persisted in much of the Arab world. 1868–1910: Thailand and Cambodia abolished slavery. 1873: End of slavery in Puerto Rico. 1884: Legal status of slavery abolished in Malaya. 1886: Cuba ended slavery. 1884, Nov.–1885, Feb.: The Berlin Conference formally prohibited slavery in the Congo, but King Leopold's subsequent use of enforced black labor virtually voided the antislavery provisions. 1877, Aug.: Egypt and Britain signed a Slave Trade Convention, providing for an end to the slave trade in the Sudan by 1889 (it was not effective). 1888, 13 May: Brazil abolished slavery. 1916: Slavery made illegal in southern Nigeria and in all of Kenya. Tradition remained a key factor inhibiting labor mobility everywhere in the less developed world. The caste system in India was not conducive to labor mobility. In a number of Latin American countries, Ecuador, Peru, Bolivia, and in parts of Central America, Indians and poor mestizos fell into debt to landlords and signed wage contracts to cover the debt that involved debtor servitude; such contracts served to impede labor mobility. Similarly, in exchange for land, certain relationships of servitude or indenture existed in the west-coast countries of Latin America.

Quality of labor: In all the less developed countries, there was a persistent shortage of skilled, literate labor. In India, despite overpopulation, there was an acute shortage of factory workers. Labor was uncommitted to factory work, and served part time in farming. Other less developed countries found similar shortages. On foreign-owned plantations and even more in the mining camps, workers were taught elementary skills which had been lacking. The absence of skilled, literate workers was unquestionably a major factor in retarding industrialization. Even more, the absence of managers and technicians retarded industrialization.

ENERGY. The energy resources of the less developed world remained for the most part undeveloped. The use of steam power in developing modern industry spread slowly in India and China and parts of Latin America. The use of elec-

tric power and the power of the internal combustion engine was starting. 1893: 1st use of hydroelectric power in Mexico. 1901: 1st large hydroelectric plant started in Brazil. Human, animal, and water power were, however, still the main sources of energy for most of the less developed world.

INDUSTRIES. Textiles: India's modern textile industry had preceded Japan's, yet it developed more slowly. 1876: India had a million power driven spindles. 1887: Empress Mills Factory started operations in Nagpur, India, founded by Jamsetjee N. Tata (1839-1904); it installed the newest British machinery and was an innovator in the Indian textile industry. Indian cotton textile factories were under the control of Indians, including Parsees, and were located in Bombay and western India. Often they employed British managers. While the Indian industry had difficulty maintaining itself against the pressure of goods imported from Britain and later (in the 20th cent.) from Japan, the industry did develop. 1914: India was the 4th largest cotton manufacturer in the world (following the U.S., Great Britain, and Japan). India likewise developed an important jute industry. 1870's: Boom in jute production; 1908: Calcutta jute output surpassed that of Dundee. 1890: China's 1st modern textile mill was established, the Shanghai Machine Cotton Weaving Co. 1912: China passed the million mark in power spindles; 1913: there were 46 Chinese-owned cotton mills in that country, and a number of others which were financed by foreign capital. In the cotton-producing countries in Latin America, modern textile industries developed. 1909: There were a million power-driven spindles in Brazil. Brazil's textile industry developed slowly because of high production costs. (Transportation of the raw cotton to the factory was expensive, coal for steam power was usually imported, productivity was low, equipment was imported, marketing charges were high with poor transportation, and taxation proved a handicap.) 1880's-1910: Modern textile industries in Mexico, Peru, and to a lesser extent Colombia and Venezuela developed. British

textile machinery and technicians from Lancashire were often imported for the industry. In the Ottoman Empire, there were successful silk factories (in Lebanon), a variety of carpet-weaving plants, and a few cotton-yarn factories. Many of the latter were failures; attempts at modernization were unsuccessful; older handicraft industries disappeared; and the empire became increasingly dependent on imports of cotton yarn and fabrics. Egypt did start a few modern textile plants and 2 spinning mills; it was exceptional on the African continent. South of the Sahara there were no modern textile plants, and increasingly African consumers imported western textiles.

Iron and steel: The iron and steel industries in the less developed countries were in their infancy. 1890: Construction of China's 1st modern iron and steel plant, the Hanyang Iron and Steel Works, began in Hankow (completed 1893); 1914: production, 135,000 tons of steel; that year, the iron and steel firm passed to Japanese financial and managerial control; 1914-18: Japanese influence in the Chinese iron and steel industry grew. 1900-1903: 1st modern steelworks in Latin America built at Monterrey, a joint venture of American and Mexican capital. 1905: Chilean government granted a concession to a French co. to start an iron and steel industry in Chile (the French enterprise was not a success). 1911, Dec.: Operation of Tata Iron and Steel Co. began in Bengal, 155 mi. west of Calcutta, financed by Indian capital but with foreign management; this was India's 1st iron and steel plant. 1914: production: 150,000 tons of pig iron and 75,000 tons of finished steel. 1917, 19 Oct.: 1st successful manufacture of commercial steel in Brazil—in the Engenho de Dentro works of the Central Railroad of Brazil.

Other industries: An assortment of modern industries, all on a small scale, began to develop in India, China, and parts of Latin America (Brazil and Mexico, mainly). In Egypt, under the British occupation, some breweries, cigarette factories, and soap manufacturing developed. These were typical early industries. Other early industries included

flour milling and sugar refining. In Brazil there were glass and paper factories. 1914: In India cement production started. But industrialization in the less developed world was limited.

TRANSPORTATION. Railroads: Railroad construction expanded in Asia, Africa, and Latin America. Railroads

were built primarily by foreign capital; most were designed to bring primary products (agricultural and mineral) into world commerce. Some had as a goal more effective colonial administration. Improved ocean transportation connected with the railroads.

RAILROADS IN THE LESS DEVELOPED WORLD
(000 mi.)

	1870	1880	1890	1900	1910	1920
Latin America	2.4	7.9	34.9	37.5	60.7	69.2
Asia (excl. Russia)	5.1	10.0	20.1	36.5	59.5	59.5
Africa	1.1	2.9	5.9	12.5	23.0	n.a.

1870: Brazil had 650 mi. of railroad; 1920, 17,800 mi., the railroads were built mainly by foreign capital. 1876, June: 1st railroad opened in China, with capital provided by the British trading house of Jardine, Mattheson & Co. (a short line from Shanghai to Kiangwan); 1876, Aug. a Chinese was killed on the railroad; 1877: the rails were torn up and shipped to Formosa (where they rusted); 1880: the Tangshan Hsukochwang railroad was built in China between the Kaiping coal mines and Pei Tang; 1896: China had only 240 mi. of railroad; 1896 ff.: the French, Russians, British, Japanese, and later Americans got concessions to build railroads in China. 1920: Only 5,000 mi. of railroads in China; many provinces had no railroads at all; transportation was inadequate. 1877: Mexico had 417 mi. of railroad; 1920: 13,000 mi., mainly financed by foreign capital. 1885: 1st railroad in Malaya, built to transport tin from the mines; 1st railroad in tropical Africa, connecting Dakar with the Senegal River port of St. Louis. 1888, 12 Aug.: Railroad connections made between Constantinople and Western Europe; 1889: German investors started railroad construction in Turkey; this was the 1st step on a projected Berlin to Baghdad Railroad; large sections of the railroad were built but at the outbreak of war, 1914, the railroad had not been completed. 1890's: Much of African railroad construction was in South Africa, 1892: 1st railroad built in Iran; 1915: Iran had no other railroads; 1916: Russian company completed a line from

Dzhulfa to Tabriz. 1893: 1st railroad opened in Thailand 1896: Kenya-Uganda railroad started, a key East African railroad. 1900-1910: Intensive railroad building in India, based on British capital; 1920: India alone had 37,000 mi. of railroad. 1903. Benguela railroad started in Africa. 1909: British South Africa Co. had provided Southern and Northern Rhodesia with their railroad systems, offering alternative routes to the sea through the Cape or through Beira.

Consequences of railroad building: New areas were opened to development. Agricultural properties and mines were brought into commercial development. Isolation of communities was broken down. Employment on railroads meant the introduction of cash wages and more monetization. Not only did railroads open new sources of supplies but they opened new markets. 1920: Lord Lugard estimated that 1 railroad train in Africa could do the work of 13,000 human carriers at $\frac{1}{20}$ the cost. Locomotives were not bothered by the tsetse fly, which killed draft animals in much of Africa. Thus, with the railroads, large areas in Africa became open to development. But railroad construction in the less developed world was not sufficient to create country-wide markets because of the low per capita income.

Other means of transportation: Despite the development of the railroad, primitive means of transportation still persisted in most of the less developed world. Human carriers were widely used. Where tsetse flies were absent, pack animals were

used in many areas. Automobile usage in the less developed nations was low. Internal water transport was aided by the increasing use of steamships, but traditional means of travel by water persisted.

COMMUNICATIONS. Under the aegis of foreign investment and colonial administrators, telegraph lines were introduced worldwide. 1870-71: Cable lines connected Vladivostok, Nagasaki, Shanghai, Hong Kong, and Singapore, and from there telegraph communications went around the world via London and San Francisco.

FINANCE. All the less developed countries were short of capital. They had no domestic capital markets of importance. Many countries borrowed in Europe. With the aid of European entrepreneurs private companies floated their stock in Europe. Colonial governments often became involved in local enterprises because of the absence of available private (foreign or domestic) capital. In China the government took part in Chinese industry. Banking intermediaries (foreign and domestic) came into existence in the less developed areas, but they were inadequate to serve the needs of economic development. Everywhere there were foreign banking houses. 1896: 1st modern Chinese bank established, Imperial Bank of China. 1913: Bank of China started under government auspices; 1914: 17 modern banks in China; modern banking began to replace the old-fashioned Shansi banks. 1915: Chinese government authorized the creation of agricultural banks. In India, banking lagged; the government of India was the key banker in the country; in these years it had its own cash balances and had exclusive right of note issue. 1913: British-owned exchange banks—handling remittances of monies to and from India—numbered 12; there were 18 joint-stock banks in India, with capital and reserves of more than Rs. 5 lakhs (Rs. 500,000); there were also the Presidency banks. 1890: Imperial Bank of Persia founded, chartered in England. 1891: Loan Bank of Persia established, as branch of the Russian State Bank. In the Ottoman Empire, foreign banks proliferated; 1888: the government founded an agricultural bank in the Ottoman

Empire. In Latin America new banking institutions started; 1871, 17 Aug.: Banco Nacional de Bolivia founded; 1911: Banco Central de Bolivia established. 1882: Banco Nacional Mexicano founded (1884: reorganized as Banco Nacional de Mexico, S. A.). 1888-89: New banks in Brazil multiplied. *In toto*, banking facilities in the less developed world, however, were not plentiful. Moneylenders, charging high rates of interest, continued to be prevalent in all countries.

Stock exchanges: Less developed countries had no domestic capital markets of importance, although stock exchanges were being started. 1892: 1st stock exchange in Chile established in Valparaiso; 1893: stock exchange in Santiago, Chile, begun. 1893: A mercantile exchange, the Royal Exchange, was established in Calcutta. 1899: Indian Share and Stock-Brokers Association formed in Bombay; it dealt in joint-stock co. securities. 1908: The Calcutta Stock Exchange Association was started. Often with the aid of European entrepreneurs, private cos. in less developed countries would sell their securities on European exchanges.

FOREIGN TRADE. Commodity exports from undeveloped nations rose, and European and American businessmen made investments in agriculture, mining, and trade in less developed nations, as Latin America became increasingly settled, as railroads penetrated the interiors of all continents, as port facilities were improved, as the Suez Canal (completed 1869) made transportation between East and West easier and the Panama Canal, opened Aug. 1914, encouraged trade between the U.S. and Latin America, as refrigerated cars aided the movement of tropical output, and as the demands in most developed nations grew, based on higher income in the latter nations.

VALUE OF FOREIGN TRADE IN 1913
(EXPORTS PLUS IMPORTS)
(\$ million)

British India	1,383
China	750
Brazil	643

Less developed countries were typically exporters of primary materials and importers of manufactured goods. The un-

equal treaties of earlier years meant that many less developed countries could not place high duties on imports. Some less developed countries, which had in earlier years exported manufactured products, found they could no longer compete in world markets. 1900 ft.: India lost its export markets for cotton goods in the Far East to Japan. Probably the only instance where a less developed country developed a new manufactured product as an important export was India, with its export of manufactured jute. There were some other cases where there were exports of manufactured goods, based on the processing of local raw materials.

Trading cos.: The age of the chartered co temporarily returned. Having eschewed monopoly privileges and having dissolved the major trading cos of times past, Great Britain in Africa and in Borneo, and Germany in Africa, re-embarked on a policy of chartering giant trading cos. with special privileges. Outside of Africa and Borneo, however, large trading cos. with monopoly rights and administrative functions were a thing of the past. Trading firms and corporations, without monopolies, handled international transactions.

Consequences of foreign-trade expansion: Increased foreign trade introduced money into less developed countries. Port cities grew up based on foreign trade. The coastal towns remained in sharp contrast to the interiors of many nations where commercialization had not penetrated, yet more and more, Africans and Asians who had never had any contact with money became fewer. Foreign trade introduced new products to the less developed countries. As international trade grew, banking, insurance, shipping, and marketing abroad continued to be handled in large part by foreigners. Thus the benefits of this activity did not accrue to indigenous entrepreneurs. Yet in some countries there developed certain services connected with trade—and moneys were made locally. Chinese merchants—aided by their guild organizations—began to handle the distribution within that country of imported goods. In India and China profits made from these activities were sometimes reinvested within the

country. Indian merchants mingled their capital with British money in developing industry. Chinese merchants invested in industries (in joint activities with the government or with foreign capital, and sometimes alone). Yet frequently, in the less developed countries, men who made money did not invest their earnings at home; instead they spent the earnings on articles of consumption imported from abroad. Thus, moneys made from foreign trade did not altogether satisfactorily serve the function of providing domestic investment capital, as had been the case, for example, in Great Britain and the U.S.

FOREIGN INVESTMENT. Foreign investment in the less developed countries played an increasingly important role. In some countries, foreign investment prompted the extension of imperialism. Thus, 1869: the bey of Tunis, who had borrowed heavily in Europe, did not meet his obligations, and Britain, France, and Italy exercised financial control over Tunis, 1881: France occupied Tunis, making it a French protectorate. 1876, 4 Apr.: The British accused the Khedive Ismail of Egypt of poor financial management, and advocated European supervision; 18 Nov., khedival decree appointed British and French controllers to manage the Egyptian debt, 1878, 15 Aug.: Sir Rivers Wilson (an Englishman) made minister of finance and M. de Blignières (a Frenchman) made minister of public works; 1879, 25 June: sultan of Turkey deposed Ismail; 4 Sept.: under new khedive, Tewfik, European controllers were reappointed and their tenure was subject to British and French (not Egyptian) "Anglo-French Dual Control." 1880, 17 July: Law of Liquidation provided that all Egyptian budgetary surpluses should go to service the national debt; 1882, 11 July: after threats to British investment, the British landed troops in Egypt to protect the Suez Canal; 15 Sept.: British occupied Cairo; 9 Nov.: Dual Control of Britain and France ended; the British took charge. 1883–1907: Sir Evelyn Baring (1841–1917; 1892, Lord Cromer), as British Consul-General in Egypt, reordered Egyptian public finance. In short, foreign investment led to British occupation. Similarly, French

occupation of Morocco was closely tied to the protection of foreign loans. Foreign investment also led to foreign administration: the British established a number of chartered cos. in Africa, and Britain then followed as colonizer. Because of their foreign debts, some less developed countries lost control of their finances and were faced to greater or less degree with the presence of foreign administrators. 1900, Jan., and 1903-4: Persia pledged its customs revenues at all places except Fars and the Persian Gulf ports to the Russians, and at Fars and the Persian Gulf ports to the British in return for foreign loans. 1917: American financial commission was established in Nicaragua to stabilize that nation's finances. In these cases, political interference followed foreign loans. In other instances, the prior presence of colonial governments created a good environment for foreign investment. Likewise, the foreign-investment climate was improved by the presence of the western powers in China, supported by unequal treaties, extraterritoriality, open ports (1895, 15 Apr.: Treaty of Shimonoseki at end of Sino-Japanese War gave Japanese subjects freedom to engage in manufacturing in open ports and towns in China; other nations got the same advantage under the most-favored-nation clause), spheres of influence (1895, 20 June: treaty between China and France gave France a sphere of influence south to the borders of French Indochina; 1896 and 1899: Russia obtained a sphere of influence in Manchuria; 1898, Feb.: Britain got from the Chinese government the Yangtze Valley as her sphere of influence; 1905, 5 Sept.: in the Treaty of Portsmouth, after the Russo-Japanese War, Russia handed over her sphere of influence in south Manchuria to Japan; 1905: Japan also obtained Shantung as her sphere), and leased areas (1898, 6 Mar.: the Germans leased Kiaochow; 27 Mar. and 7 May: Russians leased the southern part of the Liaotung Peninsula, including Talienwan and Port Arthur; 10 Apr.: France leased Kwangchow; 9 June: Britain secured a lease of Kowloon and Weihaiwei; 1905, 5 Sept.: Japanese took over

the Russian lease of the southern part of the Liaotung Peninsula; the leased areas were under the complete control of the foreign power during the term of the lease, in all cases 99 years except in the Russian lease and the British lease of Weihaiwei, which were both 25 years). The political implications of foreign investment were thus extensive; the loss of national sovereignty that might occur after the acceptance of foreign loans or preliminary to foreign investment was feared in less developed countries. Yet there were important benefits that did accrue to less developed regions as a result of the British, Dutch, Belgian, French, German, American, Canadian, Japanese, and Russian investments that went into railroads, port facilities, schools, plantations, mines, public utilities, and banking in less developed regions. Oil production began, based on foreign capital. Foreign investment stimulated trading activities. While there were certain foreign investments in manufacturing in less developed countries, this was not typical, because within the latter there was no large domestic market for locally produced goods; moreover the industrial nations wanted to export *their* products to the less developed countries. Most foreign investments in manufacturing in the less developed countries that did exist were in the processing of materials for export or in manufacturing for the use of the expatriate community of the plantation, in the mining town, or in the foreign concession. Exceptions were foreign investments in cigarette factories that sold their product in the less developed countries. Foreign investments assisted economic progress through the establishment of infrastructure and in the development of primary products for export; foreign investment was not aimed at industrialization of the less developed nations. Industrialization that occurred, based on foreign investment, was an extra bonus rather than an intended consequence. As a result of foreign investment, new resources went into international commerce; in time in many nations this commerce would provide sources of tax-

able revenue. Foreign investment brought money into the economy, and there were linkage effects; wage laborers had money to spend, no matter how little. Services developed as a result of foreign investment, which provided income for local people. Local farmers produced crops which were sold to the foreign investor. Local mines developed, based on the existence of foreign demand as represented by a new smelter. Foreign investors introduced new skills. Foreign investors in many cases introduced the conception of profit making. Foreign investors demonstrated new standards of health, sanitation, and education. Foreign investment brought in new capital that was not otherwise available. In the Middle East, foreign investment accounted for the greater part of net capital formation. 1900-1914: Annual capital imports into India from Britain came to about 1% of Indian national income. In China, foreign capital dominated the modern sector; it provoked the Chinese government and Chinese people to try to modernize their economy. Foreign investment brought to the less developed countries an obligation to repay the investment which had both positive and negative effects; the negative effects are obvious; the positive effects were that the obligation meant a need to raise revenue which stimulated development. Most important, foreign investment brought with it in every less developed country a disruption of the old economy; new social and cultural patterns as well as political and economic change came with foreign capital.

BUSINESS ORGANIZATION. Traditional family enterprises continued in less developed countries as they had for centuries. Family enterprises ranged from the small subsistence plot (cultivated by the extended family) to a variety of household activities to prosperous family firms. At the other pole, there were modern foreign-owned joint-stock cos. These companies included the limited-liability corporations that by the turn of the century were managing the Dutch plantations in the Netherlands East Indies and the banana plantations in Middle

America, the large companies that ran the Belgian mining enterprises in the Congo, and the American-owned mining enterprises in Latin America. For all kinds of mining ventures in less developed countries, joint-stock cos. were organized and their stock floated on the London market. Other corporations active in less developed countries included such multinational units as Standard Oil, Lever Brothers, and British-American Tobacco. In addition, there were the new British chartered cos. 1884: British North Borneo Co. established (its aim was to develop trade and to make a profit out of land disposal and taxation). 1886: Royal Niger Co. chartered, designed to engage in trade in palm oil and palm kernels, it had monopoly privileges in Northern Nigeria (1899: British government agreed to buy the co.'s monopoly rights and its treaties, land, and mining rights, the co. kept trading posts and warehouses; 1900 ff.: Royal Niger Co. continued as a profitable trading co. with no administrative responsibilities, the British government having taken over the administration of Northern Nigeria); 1888, 3 Sept.: Imperial British East Africa Co. chartered to promote "trade, commerce, and good government" in East Africa; it expanded and established British rule in Kenya and Uganda (it sought to develop the trade routes to Uganda, to put new products into trade, and to make profits out of land sales and taxation; it became overextended; 1894: the British government bought the co.'s assets and took over the administration of British East Africa). 1889, 29 Oct.: British South Africa Co., founded by Cecil Rhodes (1853-1902), chartered by the British government to bring the lands north of the Limpopo River within the reach of miners, farmers, foresters, and traders, but primarily to develop gold mining; it built railroads and carried on the administration of Southern Rhodesia (until 12 Sept., 1923), and of Northern Rhodesia (until 1 Apr., 1924). Between the 2 poles of the various native unincorporated family enterprises and the various foreign incorporated companies were certain indigenous firms in the

modern sector, such as the Indian businesses run by managing agencies. 1870's: In China, a form of business organization, the *kuan-tu shang-pan* (the official supervision and merchant system), started new industries; the government would aid a Chinese enterprise, and the merchant would supply the basic capital; it was thought that only with official patronage would Chinese merchants invest in industry. 1894: 1st year in which total capital of new Chinese private enterprises in the modern sector (manufacturing and modern mining) exceeded that of Chinese government and government-private enterprises. 1894 ff.: Private Chinese businesses in modern industries developed (generally within the treaty ports); 1894-95: Sino-Japanese War aided in dissolving the links between the Chinese merchant and the government. Chinese merchants often went into joint ventures with foreign capital. In Latin America modern factory enterprises developed, in textiles, processed foods, and beverages, which were owned and managed by an individual, his family, or a small group of partners. These businessmen might go into several different kinds of enterprises, each on a relatively small scale. They were generally unincorporated.

Entrepreneurship: The development of entrepreneurship in the less developed countries was slow. Risk taking was not a typical attribute. Traditional attitudes and loyalties inhibited entrepreneurial behavior. Indian investors hedged their risks by using management agencies; the Chinese hedged theirs by involvement 1st with the government and then with foreign capital. In India certain groups had special entrepreneurial talents, e.g., the Parsees. A number of compradors in China became leaders in industry, but usually linked with foreign capital and generally in the treaty ports. Foreign firms in China often served entrepreneurial roles, and the Chinese imitated. There was considerable entrepreneurial activity on the part of the Chinese in Southeast Asia, where they developed new industries. In Lebanon and Syria indigenous entrepreneurs emerged to a

far greater extent than elsewhere in the Middle East, where entrepreneurship was limited. Lebanese and Syrians also migrated to become entrepreneurs away from home—in Africa and in Latin America. In Latin America successful entrepreneurs were few, but there were some. 1881: Francisco Matarazzo (1851-1937) arrived in Brazil; he was a leading example of the immigrant entrepreneur; he began as a rural store owner, started a lard refinery, then dealt in flour and grain, erected flour mills, moved into manufacture of bags for flour, then into cottonseed oil production, and next into soap and boxes; his operations became among the largest enterprises in South America. Another success was Simón Patiño (1868-1947); born in Cochabamba, Bolivia, of humble parents, Patiño acquired a small tin mine in the 1890's; by 1910 he was a millionaire; his interests expanded to include tin properties in Malaya and tin smelters in Germany and England.

GOVERNMENT POLICY. In most less developed countries, governments became involved in economic development.

Colonial governments: British government policy—that colonies must be self-supporting—meant revenues had to be found locally. Since revenues were not easy to come by, British administrators took steps to encourage economic development so that there would be sources of government income. British colonial governments, by building railroads, ports, and public utilities, and by introducing law and order, made important contributions to the development of the colonies. With the exceptions of the railways in India, the Rhodesias, and Nyasaland, the railroads throughout the British tropics were built by British colonial governments. In India, the railroads were subsidized by land grants and the state-guaranteed interest on investments; in time Indian lines came to be built by the British government directly. 1888: King Leopold organized the Comité d'Études du Haut-Congo, designed to develop the Congo with Belgian capital; 1906: Belgium adopted a plan for economic development for the Congo—probably the

1st central-government development plan. The French government provided subsidies to French colonies. Because of their concern for health, education, and commerce and as a result of their sponsorship of agricultural research, the colonial powers played important roles in economic development; they were, however, hesitant about the industrialization of the colonial areas and contributed little to that end. The introduction by the colonial powers of western concepts of law, justice, and contract likewise set a basis for later economic development.

Independent governments—Eastern Hemisphere: In the Ottoman Empire, the Convention of 1838 had deprived the empire of the right to raise tariff duties above 5%; 1862: the empire got the right to raise duties to 8%, but this was inadequate to encourage modern industry. 1873: The Ottoman Empire exempted machines used in industry from duties. 1913: The Ottoman Empire offered special privileges to individuals establishing new industries or expanding existing ones. These measures were not effective. Moreover, the rules, codes, and patterns of law existing within the empire were not conducive to economic development. China too, by the unequal treaties, was deprived of the right to set her tariffs to protect industry or to raise tariffs for revenue purposes. 1870's: The Chinese government sought to promote industrial development. 1872: Li Hung-chang undertook to develop guns, cannons, and armament industries, but this had no substantial effect on economic growth. The government introduced the *kuan-tu shang-p'an* system. But, in general, the Chinese government was not successful. The imperial government had no funds for these enterprises; often the enterprises were left to provincial governors. The government-sponsored industries found themselves in financial difficulties. 1882: Chinese imperial government exempted factory-produced cotton goods from inland transit taxes and later applied this policy to all machine-made products (but a large internal market did not develop because of the low standard of living). 1882 ff.: Provincial governments offered

monopoly privileges to companies which introduced western-type manufactures. 1898: China for the 1st time permitted the patenting of inventions. 1903: Active government promotion of private industry began in China with the formation of the Ministry of Commerce, yet promotion was limited owing to the bankruptcy of the imperial government. 1912: New republican government in China continued the policy of attempting to promote industry. 1914: Chinese government agreed to guarantee dividends of 5% to 6% of paid-up capital to stockholders in selected industrial corporations. Despite the efforts of the Chinese governments—central and provincial, before and after the revolution—they were unable to spur economic development on a substantial scale. Neither before nor after 1912 did the governments give the Chinese economy a stable set of laws and monetary practices to provide the basis for economic development. Corruption in government served as a drain on efficient use of the few existing government resources. • Where industry did develop, it was primarily in the treaty ports, where western standards prevailed.

Independent governments—Western Hemisphere: In Latin America, national governments took initial steps to prompt development. In Mexico Porfirio Diaz subsidized railroads, provided police protection for foreign investors, and granted concessions to those who would build smelters. 1903–9: The Mexican government purchased control of the main railroad lines. 1917: The Mexican constitution set the basis for a far more extensive government role in economic life. 1911 ff.: In Uruguay, President José Ordóñez began to nationalize foreign-owned public utilities. 1870 ff.: Brazil encouraged railway construction through subsidies. 1875: Brazilian government guaranteed 7% return on investment to those sugar planters who modernized production. 1879: Brazilian import tariff increased the protection granted to industry; the policy of protective tariffs was confirmed in the tariff of 1888; 1905: Brazil extended tariff protection to food output. Legislation in Brazil granted

duty exemptions on certain industrial equipment and raw materials (although this was erratic and Brazilian industries in this period complained of the tariffs on their imports of equipment). 1906-7 ff.: Coffee Valorization Scheme. The state of São Paulo, Brazil, took the initiative in the world's 1st large-scale attempt to control the world price of a foodstuff; the state, in order to establish a balance between supply and demand for coffee, intervened in the market and purchased surpluses; the plan was financed by foreign capital. Elsewhere in Latin America, governments subsidized railroads and aided in the flotation of railroad securities; they became involved in construction of highway and port facilities, but negligible effort was made by Latin American governments in the direction of industrialization.

OTHER FACTORS. In Asia and Africa there was the broad challenge of the West. With colonization came new ideas on administration, justice, and property. Christian missionaries, who arrived in large numbers with the colonizers (and before), confronted old religious values with new alternatives. Medical practices of the colonists vied with past superstitions. The basic inertia of traditional societies in Asia and Africa was jarred, even when there was no colonization—as in the case of China. Along with the western impact came humiliation; traditional societies had not stood up to the

encounter. Whereas in Japan the humiliation of the unequal treaties offered a stimulus for rapid and profound change, in most of the less developed world the humiliation of colonization or of unequal treaties and defeat in war (as in the case of China) did not spur a positive response. The revolution in China and the establishment of the republic, and the achievements of the Young Turks in the Ottoman Empire, were partially successful as attempts at modernization, but unsuccessful as attempts at economic development. Latin America had long since thrown off colonization; in much of the region, however, political instability slowed economic development. Political instability in China had similar effects. Economic development required a concept of progress, and this was absent in much of the less developed world. Likewise, a concept of nationality has served the cause of economic development. Ideas of nationalism were absent in Africa, and in Asia too they were in many cases lacking. China, which had a unity and feeling of national tradition, did not have a central government strong enough to promote political and national unity. Poor communications in most of the less developed world retarded the extension of ideas of "the nation." Throughout the less developed world the vicious circle of poverty, which begot more poverty, provided a seemingly insuperable obstacle to economic development.

1865-1914

The International Economy

INTERGOVERNMENTAL MULTINATIONAL ECONOMIC INSTITUTIONS. 1865: Latin Monetary Union established (treaty took effect, 1866), including France, Belgium, Italy, and Switzerland; 1868: Greece joined; Spain, Rumania, Finland, and several Latin American countries followed the policies of the Union without joining; it estab-

lished standards of fineness of coins and metal or metals to be used in coinage; 1873-74: it adopted the gold standard; from its adoption the use of the gold standard spread, so that by the end of the 19th cent. every country of importance in world commerce, except China and Persia, had adopted gold as the basis of its currency. 1865: 20 European nations

signed international telegraphic treaty, establishing the International Telecommunication Union; 1868: several Asiatic countries joined; 1869: International Office of Telegraphy established at Bern, Switzerland; 1875: International Telegraph Convention signed at St. Petersburg, and revised at Lisbon, 1908; there were 50 signatories to the Lisbon Convention. 1871: Universal Postal Union founded by 21 countries under the Treaty of Bern; other nations subsequently joined, the organization made the world a single postal territory. 1878: Semi-official World Meteorological Organiza-

tion established. 1879: International Bureau of Weights and Measures founded by convention signed in Paris by 17 nations. 1883: Convention of the International Union for the Protection of Industrial Property signed in Paris, protecting patents and trade marks. 1886: Bern Convention inaugurated international copyright protection. 1912: International Radiotelegraphic Convention signed in London. 1919, 25 Jan.: Resolution of the Peace Conference established the League of Nations, the Secretariat of the League was to collect information dealing with international economic problems.

THE ENERGY REVOLUTION.

WORLD PRODUCTION OF COMMERCIAL SOURCES OF ENERGY
(billion kwh electricity equivalent)

	<i>Coal^a</i>	<i>Petroleum^b</i>	<i>Natural Gas</i>	<i>Water Power</i>	<i>Total</i>
1870	1,658	8		8	1,674
1880	2,569	43		11	2,623
1890	3,894	109	40	13	4,056
1900	5,785	213	75	16	6,089
1910	8,724	467	162	34	9,387
1920	9,934	1,046	254	64	11,298

^a Includes lignite.

^b Includes natural gasoline.

THE TRANSPORTATION REVOLUTION.

SPEED OF TRANSPORT
(mph)

	<i>Horse Coach</i>	<i>Canal Tug</i>	<i>River Boat</i>	<i>Ocean Ship</i>	<i>Railroad</i>	<i>Automobile</i>	<i>Airplane</i>
1880	5	3	8	20	50		
1900	5	4	10	25	60	30	
1920	5	4	11	30	65	55	110

Even more important than speed, the actual existence of steamships, railroads,

telegraphs, and cables as well as refrigerated transport provided the basis for a global economy. The airplane made the world still smaller.

WORLD CONSUMPTION OF ENERGY
FROM COMMERCIAL SOURCES
(as % of total energy use)

1870	35.4
1880	44.3
1890	53.3
1900	62.5
1910	68.0
1920	72.7

WORLD TRADE (EXPORTS PLUS IMPORTS)
(\$ million)

1870	10.6
1880	14.7
1890	17.5
1900	20.1
1910	33.6
1913	40.4

1919-1945

The Mature Industrial Society of the West

AGRICULTURE. 1920: In the major industrial nations (except the U.S.), agricultural output was lower than before World War I.

INDEX OF PHYSICAL VOLUME OF
AGRICULTURAL PRODUCTION, 1920
(per capita of total population; 1913 = 100)

Germany	62
Belgium	78
France	83
U.K.	89
U.S.	112

1920-45: agriculture occupied an increasingly less significant role in these economies. 1920's: American agriculture did not share the general prosperity; 1930 fl.: U.S. agriculture felt the depression more severely than did industry. 1940-45: U.S. agriculture prospered. 1920-40: In Western Europe low agricultural prices existed, with the nadir in 1932-33.

Mechanization: Despite economic difficulties on American farms, mechanization increased rapidly.

TRACTORS AND AUTOMOBILES ON U.S. FARMS
(000)

	Tractors	Automobiles
1920	246	2,146
1930	920	4,135
1940	1,545	4,144
1950	2,354	4,148

In Europe, long-distance transmission of electricity and use of tractors, trucks, and, to a far lesser extent, automobiles aided the farmer. Compared with the U.S., European mechanization on the farm proceeded slowly. 1940-45: British and Swedish mechanization especially accelerated.

TRACTORS IN USE
(000)

	1939	1949
Germany	60	75 ^a
U.K.	55	280
France	30	89
Sweden	20	52

^a 70,000 in western zones, 5,000 in Soviet zone.

Self-sufficiency: 1920-45: The U.S. remained self-sufficient in foodstuffs. 1930's: Attempts were made in Britain, France, and Germany to enlarge national food output; in France and Germany, especially, the governments hoped to achieve self-sufficiency.

SELF-SUFFICIENCY IN FOODSTUFFS, 1937

	% total consumption
U.K.	25
Netherlands	67
Germany (1934 boundaries)	83
France	83

RAW MATERIALS. Coal: U.S., Germany, and Britain still led in world coal production.

COAL AND LIGNITE PRODUCTION
(million metric tons)

	1920	1930	1938
U.S.	597.2	487.1	355.3
U.K.	233.2	247.8	230.7
Germany	252.4	288.7	381.5
France	25.3	55.0	47.6
World total	1,319	1,416	1,469

1920: European coal production had been sharply affected by the war. The peace settlement provided that the Saar Basin

be detached from Germany and the coal mines ceded to France (the coal reserves of the Saar were equal to those in all of France); the settlement also provided that Upper Silesia, the source of 23% of Germany's hard coal, would go to Poland; by the peace settlement, Germany lost c. 36% of its coal reserves. 1923: French occupation of the Ruhr temporarily halved German coal output. 1930: Coal output figures reflected the worldwide depression, increases in German, French, and British output represented recovery from the postwar disorder. 1935, 1 Mar.: After a plebiscite had been held in the Saar Valley, the Saar region was returned to Germany. Germany took advantage of its rights under the peace treaty to repurchase the coal mines; this accounted for the large increase in German coal production in 1938. 1938: Coal production figures indicated German preparation for the war and the waning of U.S. and British coal industries. Liquid fuels, natural gas, and hydroelectrical power began to compete with coal; the shift had been made during World War I from coal-burning to oil-burning ships, eliminating this large source of coal consumption; improved utilization of coal in electrical generation curtailed the demand for coal. 1930's: The British coal industry was in the doldrums, as was the U.S. coal industry.

Oil: With the exception of the U.S., all the mature industrial nations continued to be importers of oil. 1919: U.S. became concerned with the problems of oil shortages; Americans began an intensive search for oil resources abroad; 1930: large east Texas oil discoveries.

OIL PRODUCTION
(million barrels of 42 U.S. gals.)

	1920	1930	1938

World total	688.9	1,411.9	1,978.3

Iron ore: 1919: When Lorraine was returned to France, Germany lost the source of 74% of its prewar iron ore; Germany had to buy from France. 1930's: German improvements in steelmaking meant it could use previously unutilized ore. 1938-41: German territorial expan-

sion brought huge iron-ore resources under its control. The U.S. remained basically self-sufficient in iron ore. 1938: Great Britain's output of iron ore was 11,800 metric tons; its imports were 5,100 metric tons.

General: 1930's: Key innovations in raw-material usage occurred as a result of the German drive toward self-sufficiency. The Germans developed new chemical industries based on utilization of waste wood and German timber; they put more acreage into such industrial raw materials as flax and hemp; they sought to develop substitutes for basic raw materials.

Synthetics revolution: 1920-45: Increasingly, in the mature industrial nations substitutes for natural raw materials appeared—rayon for silk, plastic for wood, clay, glass, and metals, synthetic nitrates for natural nitrates, and synthetic rubber for natural rubber, research was done on obtaining oil from coal. Such steps made industrial nations less dependent on specific primary products

ENERGY. Use of electric power and the internal combustion engine created a revolution as great as the one caused by the use of steam in the 1st Industrial Revolution.

ENERGY CONSUMPTION PER CAPITA, 1937
(electricity equivalent in kwh
for all energy sources)

	Per Capita Use	Ratio of Inanimate to All Other Sources
U.S.	6,996	97.6
U.K.	5,553	97.9
Germany	3,461	96.2

A substantial portion of the world's energy production was represented by the major industrial nations.

^a Estimated. 1940 figure is not available; 1937, 8.9; 1943, 12.0.

Internal-combustion engine: The internal-combustion engine as a means of powering transport came of age. 1924, 17 Dec.: 1st diesel-electric locomotive put into service in the U.S.

Rocket power: 1919, 28 June: Treaty of Versailles disarmed Germany of its military air force, but did not mention rockets as potential weapons; Germany could develop them without treaty violation. 1923, 1 Nov.: American Robert H. Goddard (1882-1945) successfully operated a liquid oxygen and gasoline rocket motor on a testing frame. 1923: Publication in Germany of Hermann Oberth, *Die Rakete zu den Planetenräumen* (*The Rocket into Interplanetary Space*), which stimulated widespread discussion of rocket propulsion. 1928, 11 Apr.: 1st manned rocket automobile tested by Fritz von Opel, Max Valier, and others in Berlin, Germany. 1930, 17 Dec.:

GROWTH IN ELECTRICITY PRODUCTION PER CAPITA, 1920-47

German army decided to develop military missiles. 1930: British inventor Frank Whittle (b. 1907) awarded patents for 1st turbojet engine. 1932: German engineer Paul Schmidt patented a ramjet engine, which was later modified and used in the V-1 flying bomb. 1937, 12 Apr.: Whittle's 1st gas turbine engine, the U-type, was static-tested. 1942, 22 Oct.: Westinghouse Electric Co. got government authorization to build the 1st practical jet engines of wholly American design. 1944, 17 Nov.: Following the success of the German missiles, U.S. Army Ordnance initiated the "Hermes" program for research into and development of ballistic missiles. (When on 31 Dec., 1954, Army Ordnance ended the Hermes project, the latter had developed high-performance liquid-fuel rockets and stabilized platform inertial guidance equipment).

Atomic energy: 1942, 2 Dec.: 1st self-perpetuating nuclear chain reaction (fission of uranium isotope U-235) was achieved at the University of Chicago, under physicists Arthur H. Compton (1892-1962), Enrico Fermi (1901-54),

and others. 1945, 16 July: 1st atomic bomb tested at Alamogordo, N.M. (bombs were dropped 6 Aug. on Hiroshima and 9 Aug. on Nagasaki, Japan); the harnessing of the atom opened the way for a new source of industrial energy.

INDUSTRY. 1919: In the U.S. new capacity had been built during the war; many industries in America had not been fully converted to war production and so reconversion was not difficult; there was no physical damage in the U.S. In Europe economic dislocation was immense; nations had to convert from war to civilian production and reconstruct plants damaged during the war. In the U.S. and Europe the war had witnessed inflation, which created adjustment problems in the postwar era; demobilization caused an indigestion of man power. 1920-21: Severe economic downturn in the U.S. and Europe. 1922-24: Rapid recovery in the U.S.; slow recovery in most of Europe,

with France the exception. 1924: Industrial production in France had surpassed the 1913 level; based on 1913 = 100, the index for manufacturing production in France was 117.9, in England only 87.8, while in Germany it was 81.8. 1925-29: Industrial growth in Europe and especially in the U.S. was the norm. 1929-33: During the Great Depression industrial output fell. 1933-39: France remained in general stagnation. 1933 ff.: U.S. witnessed languid recovery, blemished by the depression of 1938, and then followed by an upturn with the war demands; British industrial expansion resumed until 1937, when the recession of 1937-38 slowed development, which restarted with the outbreak of war. German industrial growth, sharply jarred by the depression, moved upward as Germany prepared for war. 1930's: Growth of manufacturing in the mature industrial nations did not keep pace with the world as a whole.

INDEXES OF MANUFACTURING ACTIVITY
(1913 = 100)

	U.S.	Germany	U.K.	France	World
1920	122.2	59.0	92.6	70.4	93.2
1921	98.0	74.7	55.1	61.4	81.1

SOURCE: League of Nations, *Industrialization and Foreign Trade*, New York, 1945.

In the mature industrial nations innovations were not for the most part in textiles (except for synthetics), or in iron and steel, or in shipbuilding.

Textiles: 1920's: To counteract decline, certain American textile companies trans-

ferred their operations from New England to the South, where labor rates were lower; 1930's: the textile industry in the U.S. floundered. 1920-40: The British textile industry, Britain's great staple in the past, was on the decline; 1924: British

% DISTRIBUTION OF THE WORLD'S
MANUFACTURING PRODUCTION

1913 ^a	35.8	14.3	14.1	7.0
1926/29	42.2	11.6	9.4	6.6
1936/38	32.2	10.7	9.2	4.5

^a These 1913 figures (unlike those on p. 707 above) are adjusted to represent the frontiers established after World War I.

SOURCE: League of Nations, *Industrialization and Foreign Trade*, New York, 1945.

output of cotton textiles equaled £84 million; 1935: British cotton textile output was £40 million. Rayon production in the U.S. and Great Britain grew.

Iron and steel: Basic innovations were absent in iron- and steelmaking, although there were advances in metallurgy and chemistry of steels (new alloys and improvements in old methods: larger ovens, mechanization of rolling mills, and fuel economy); in Germany new processes of producing steel, using low-grade iron ore, were introduced by the state-owned Hermann Göring Works. On the whole, however, the iron and steel industries in the mature nations were not progressive industries and were slow to adopt what technological improvements there were. Growth industries in the mature industrial nations were automobiles, chemicals, and electrical supplies of all kinds. The pattern of development in the growth industries varied by country and by decade.

Automobiles: 1920's: Prosperity in America was linked with the expansion of the automobile industry. 1929: In the U.S., automobile production peaked at an output of 4.5 m. passenger cars, a figure not exceeded again until after World War II; the U.S. automobile industry had 3 large producers, Ford, General Motors, and Chrysler (formed in 1925). 1919 ff.: Europe copied America's mass-production methods; in England, Morris and Austin produced cars by mass production; Ford expanded its output at Manchester, England; in France, Renault and Citroën adopted moving assembly lines. 1924: Adam Opel, A.G., in Germany (which had begun to manufacture cars in 1898) started postwar operations, adopting American mass-production

methods; it made a small car and led in German industry. 1925: General Motors bought the small British producer, Vauxhall Motors, Ltd. 1928 ff.: Ford started construction of the largest automobile plant outside the U.S., at Dagenham, England (1st cars produced in 1931). 1929: General Motors purchased control of Adam Opel, A.G., giving G.M. leadership in the German automobile industry. 1931: Ford started to manufacture at Cologne, Germany. 1934: Ford began to make automobiles in France; Simca (Société Industrielle de Mécanique et Carrosserie), the successor to a Fiat dealership in France, began to produce Fiat cars in France. 1934, 8 Mar.: Adolf Hitler proposed the *Volkswagen*, a cheap mass-produced vehicle. 1934 ff.: British, German, and French automobile output (protected by tariff barriers) rose, in all these countries small cars, locally produced, designed for the European markets, made progress over the imported large American units. 1930's: U.S. automobile production was lower than in the 1920's; in Europe, automobile output exceeded the European levels of the 1920's, but the U.S. industry continued to outproduce all of Europe.

Chemical industry. 1919 ff.: The American chemical industry adopted innovations developed in Europe (rayon, cellophane, etc.). 1920: Standard Oil (N.J.) produced isopropyl alcohol commercially, the 1st chemical from petroleum. 1923: Thiokol, 1st synthetic rubber, discovered by American chemist J. C. Patrick (1892-1965). 1925, 28 Nov.: I. G. Farbenindustrie formed, combining all the major chemical producers in Germany; I. G. Farben diversified into all facets of the chemical industry. 1928, Oct.: Imperial Chemical Industries (I.C.I.) joined together the 4 great British companies manufacturing heavy chemicals, alkalies, explosives, and coal-tar dyes into a new company with an authorized capital of £65 million, a new high in Britain. 1928: Établissements Kuhlmann in France linked the Kuhlmann enterprises (in sulphuric acid), St.-Gobain (heavy chemicals, alkalies, fertilizers, glass, etc.), Pechiney (electrochemicals), and the

Nitrogenous & Compositd Fertilizer Co. (synthetic ammonia). 1929: In the U.S., there was no single great chemical company, the leaders in the American chemical industry were Du Pont, Allied Chemical, and Union Carbide; there were a large number of pharmaceutical concerns, the oil companies were becoming interested in the chemical industry. 1920's: The age of synthetics and new chemical processes; synthetic nitrogen increasingly replaced natural nitrates, synthetics challenged wood chemicals, synthetic medicines rose in numbers, synthetic lacquers and resins came into commercial production, the phenolic and cellulosic plastics were widely used, rayon output grew, the petrochemical industries began, and hydrogenation of oil and coal was developed. 1931: Belgian-born American chemist Julius A. Nieuwland (1878-1936) discovered "Neoprene," a synthetic rubber introduced by Du Pont. 1933: I.C.I. made 1st commercially produced synthetic detergent; soapless shampoos were developed in Germany by I. G. Farben. 1934: 1st Buna rubber (S) patented in Germany by I. G. Farben, commercial production of vitamin C began in the U.S. and Europe, the 1st vitamin to be prepared chemically. 1935, 28 Feb.: Nylon discovered by Wallace H. Carothers (1896-1937), American chemist, at Du Pont (1940, 15 May: nylon stockings 1st put on sale). 1936: Leonard Colebrook and Neave Kenny in England introduced sulfanilamide, the 1st of the sulfa drugs. (1938: A. J. Ewins and M. A. Phillips in England synthesized sulfapyridine, the most effective of the early sulfa drugs.) 1937, Mar.: Sun Oil Co. began to operate the 1st fully commercial catalytic cracking unit by the Houdry process, developed by French engineer Eugène J. Houdry (1892-1962); the Houdry process created a revolution in oil refining, producing high-octane gasoline at quality and yields better than ever before. 1938: "Fiberglas" patented by Americans Games Slayter (1896-1964) and John H. Thomas (b. 1907). 1939: Swiss chemist Paul Muller (1899-1965) invented DDT. 1930's: Large expansion in synthetic plastics and abrasives; the Germans maintained superiority

in a wide range of chemical products. 1939: The value of chemicals produced by American industry totaled \$3.7 billion compared with \$454 million in 1920; a chemical revolution had taken place, involving the use of chemicals in many industries and the spread of new chemical processes and new synthetic products. 1930's: In the mature industrial nations, especially the U.S. and Germany, the chemical industries were highly innovative. 1942: Penicillin (discovered in England in 1929) was introduced to the public, the 1st antibiotic to prove useful for injection into the body. 1944: Streptomycin introduced. The age of antibiotics had begun.

Electrical industries: The expanding use of electric power meant a comparable growth in the manufacture of industrial and consumer electrical products. 1919: General Electric Co. formed Radio Corporation of America. 1920's: The radio changed from a toy to a household appliance in all the mature industrial nations. 1924: 1st television system developed. 1925: The 1st 2 theaters in the world to be completely air-conditioned were in New York, the Rivoli and the Rialto; this stimulated the development of air-conditioning equipment by electrical cos.; 1st automatic electric percolator developed in the U.S.; 1926: 1st automatic electric toasters for use in the home produced in the U.S. 1929, Jan.: Formation of Associated Electrical Industries, Ltd. in England, a merger of several of the largest British electrical firms. 1930, July: Schick, Inc., marketed the 1st commercial electric shaver. 1937: 1st fully automatic electrically operated washing machine produced in the U.S. 1938: Introduction of fluorescent lamps in the U.S. 1939: R.C.A. demonstrated 1st color T.V. 1940's: Electronics developed as a subsidiary of the electrical industry. 1944, May: Professor Howard Hathaway Aiken (b. 1900), with the co-operation of International Business Machines, built an automatic sequence-controlled calculator, Harvard Mark I; this was the 1st successful general-purpose digital computer. 1945: John W. Mauchly (b. 1907) and J. Presper Eckert (b. 1919) at the Uni-

versity of Pennsylvania designed and built the Electronic Numerical Integrator and Calculator (ENIAC), the 1st electronic computer. 1945, May: 1st computer program, written by J. von Neumann (1903-57), for the Electronic Discrete Variable Automatic Computer (EDVAC), then under design.

Aircraft industry: An aircraft industry grew in every mature industrial nation.

AVERAGE ANNUAL INCREASE IN
MANUFACTURING, 1933-48
(% per annum)

U.S.	8.1
Belgium	2.4
U.K.	1.5
Holland	1.0
France	.2

SOURCE: UN, *Growth of World Industry—National Tables*.

1938-48: Decline in manufacturing activity in West Germany was equivalent to an average annual loss of 6.9%.

CONSUMER GOODS. 1920's: Revolution in consumer goods industries, espe-

cially in U.S.: automobiles, electrical appliances (from radios to refrigerators), cosmetics, etc., were widely available to consumers. Consumer goods were accompanied by consumer credit provisions and new retailing outlets. The U.S. had developed mass-production industries that went far beyond those related to housing, clothing, feeding, and defense. 1930's: Depression temporarily dampened consumer spending. 1939-45: Industries converted from consumer goods to wartime industries.

TRANSPORTATION. Railroads: 1919 ff.: Traffic on the railroads rose steadily in the U.K., France, and Germany. 1919-39: American railroads were eclipsed by the automobile; passenger traffic declined. 1924-41: Transition from steam to diesel and diesel-electric locomotives.

Automobiles, trucks, and highways: 1919 ff.: Automobile travel in the U.S. and Europe grew rapidly, but the private automobile in Europe was not nearly as ubiquitous as in the U.S.; in the U.S. and Europe, the truck began to provide competition with the railroads for freight traffic.

REGISTERED MOTOR VEHICLES

Expansion of motor vehicle use created a need for new roads and highways. 1930's: Highway construction was a form of public works to use the unemployed, especially in Germany and the U.S. 1933, June: Law passed in Germany authorizing construction of 4,200 miles of Reich motor roads. 1933-40: Germany built a system of expressways (the *Autobahnen*). 1940: In the U.S. the Pennsylvania Turnpike opened, the 1st modern toll road in America.

Air travel: 1919, 5 Feb.: 1st civilian airline with passenger service, Germany's

Deutsche Luftreederei, started operations between Berlin, Leipzig, and Weimar; 8-31 May: American Albert Cushing Read (1887-1967) made 1st transatlantic crossing, stopping at 2 islands in the Azores, at Lisbon, and then on to Plymouth, England. 14-15 June: British aviators Capt. John Alcock (1892-1919) and Lieut. Arthur W. Brown (1886-1948) made 1st nonstop transatlantic crossing by airplane (Newfoundland to Ireland, 1,936 mi.—15 hrs. and 57 mins). 1924, 6 Apr.-28 Sept.: 3 U.S. Army planes circumnavigated the globe. 1927, 20-21 May: American Charles

A. Lindbergh (b. 1902) in his monoplane, *Spirit of St. Louis*, made 1st non-stop solo flight from New York to Paris, 3,610 mi.—33 hrs. and 29 mins. 1929, 24 Sept.: American aviator James H. Doolittle (b. 1896) made 1st public all-blind (i.e. instrument) flight, accompanied by a check pilot. 1935, 9 Mar.: Hermann Göring announced the existence of a German Air Force, this meant that Germany was openly violating the Treaty of Versailles; Dec.: U.S.-built Douglas DC-3 made its 1st flight; the DC-3 was one of the most successful aircraft in aviation history. (By 1938 the bulk of air travel in the U.S. was by DC-3.) 1937: Scheduled airlines worldwide transported 2.5 m. passengers. 1938, 10-14 July: American Howard Hughes (b. 1905), with 4 others, flew around the world in 3 days, 19 hrs., and 17 mins. 1939, 20 May: Pan American Airways started regular commercial flights between the U.S. and Europe, by way of the Azores 1939-45: Air travel for military purposes expanded. 1940, 8 July: Boeing 307-B Stratoliner made 1st commercial flight with a pressurized cabin. Application of new forms of propulsion to air travel: 1926, 16 Mar.: Goddard launched world's 1st liquid-fueled rocket at Auburn, Mass.; it traveled 184 ft. in 2½ secs.; the event was the "Kitty Hawk" of rocket history. 1928, 11 June: Friedrich Stamer in Germany made 1st rocket-powered flight in a tailless glider (1-mi. flight). 1929, 17 July: Goddard fired a liquid-fueled rocket with a camera, thermometer, and barometer and recovered these items intact after the flight; Aug.: 1st recorded jet-assisted take-off of an airplane occurred in Dessau, Germany, powered by a battery of solid-propellant rockets; 30 Sept.: 1st jet-assisted take-off of a glider (powered with 16 rockets of 50 lbs. thrust), which made successful 75-sec. 2-mi. flight in Frankfurt, Germany; Fritz von Opel was the pilot. 1930, 4 Apr.: Formation of the American Interplanetary Society (later American Rocket Society) by David Lasser, G. Edward Pendray, Fletcher Pratt, and 9 others, with the goal of "interplanetary expeditions and travel." 1931, 14 Mar.: In Ger-

many, 1st European-made liquid-fueled rocket was launched (built by Johannes Winkler). 1939, 27 Aug.: 1st complete flight of jet-propelled aircraft, piloted by Erich Warsitz, took place secretly in Germany. 1941, 15 May: 1st official flight of British turbojet (with Whittle's jet engine); July: 1st successful U.S. jet-assisted take-off. 1942, 1 Oct.: 1st U.S. jet-propelled aircraft tested at Muroc, Calif.; aircraft was powered by engines developed by General Electric Co. in the U.S. from the British Whittle model; 3 Oct.: 1st successful experimental launch and flight of 5½-ton German rocket (V-2). 1943, Aug.: Germans launched 1st radio-controlled glide bomb against a British ship—the start of guided-missile warfare. 1944, 8 Jan.: Jet-propelled Lockheed XP-80 made 1st flight (at 500 mph) from Muroc, Calif.; this was the 1st U.S. airplane designed from the start for turbojet propulsion; it was powered by a British engine; 13 June: 1st German V-1 fell on London. 1944, Summer: German program initiated for use of manned V-1's for suicide missions, test flights made in Germany. 8 Sept.: 1st German V-2 rocket (3,400 mph) struck England. 1945, 8 May: At time of German surrender, more than 20,000 V-1's and V-2's had been fired.

COMMUNICATIONS. 1920, 16 July: World's 1st commercial radio telephone service opened between Los Angeles, Calif., and Santa Catalina Island; 2 Nov., Station KDKA, owned and operated by Westinghouse Electric & Manufacturing Co., opened in Pittsburgh—the 1st radio station to broadcast regularly scheduled programs (1st broadcast was the election returns of the Harding-Cox presidential contest). 1922: British Broadcasting Company organized; in the U.S. Albert H. Taylor and Leo C. Young 1st developed "radio detection"—the 1st step in radar. 1923: Charles Francis Jenkins (1867-1934) transmitted pictures of President Harding by radio from Washington to Philadelphia; Apr., 1st sound-on-film talking pictures (vaudeville shorts) shown at Rivoli Theater, New York. 1924: Russian-born American Vladimir K. Zworykin (b. 1889) completed a television system, in-

cluding an iconoscope (pickup eye) and kinescope (receiving tube) in the Westinghouse research laboratory in Pittsburgh; 1st 3-color traffic lights appeared in the U.S. 1926: Western Electric Co. made sound films commercially practical; British Broadcasting Corp. established, replacing British Broadcasting Co.; in U.S. Gregory Brett (b. 1899) and Merle A. Tuve (b. 1901) developed effective radar detection; in Britain J. L. Baird (1888-1946) demonstrated television in Soho. 1927: New York to London telephone communication established; talking equipment, with simultaneous action and sound, announced in U.S. for motion pictures; 1st transmission of television signals, New York to Washington, by American Telephone & Telegraph Co. 1928, 6 July: 1st all-talking moving picture presented at Strand Theater, New York; the "movie" spread rapidly and movie theaters multiplied; 11 Sept.: Radio Station WGY, Schenectady, broadcast the 1st television play. 1928: American scientist E. F. W. Alexanderson (b. 1878) made 1st demonstration of home television; in Britain J. L. Baird demonstrated color television. 1932, 11 Oct.: Television 1st used in a political campaign in the U.S. 1935: Great Britain had 5 radar detection stations in operation. 1936: Broadcasting by FM (frequency modulation) developed by American Edwin H. Armstrong (1890-1954); 2 Nov.: BBC started television service. 1938: Chester Carlson demonstrated the feasibility of xerography. (1940: Carlson took out his 1st patent; 1944: the Battelle Memorial Institute agreed to develop the invention; 1947: agreement between Battelle and the Haloid Co. (now Xerox Corp.) to further develop the invention; 1960: 1st xerographic copier marketed.) 1941: 1st full commercial television in U.S., but television did not become commonplace in the U.S. until after World War II.

FINANCE. 1919 ff.: Domestic and international finance became interwoven. The mature industrial nations were the principals in international financial relations, involving the entire world. 1919: Disruption of European financial conditions

after the war; huge wartime-incurred debts represented peacetime obligations. Wartime inflation had destroyed the value of savings, thus impeding the revival of investment; postwar inflation continued, interest rates on borrowing were high because no one knew the value of money. 1919: U.S. had become the greatest creditor nation in the world; America came out of the war with inflation, but with prosperity. U.S. returned to the gold standard. (1917: U.S. had placed an embargo on gold and suspended gold redemption.) 1921: Severe worldwide recession in the U.S. and Western Europe.

German financial crisis: 1921, 30 Apr.: Reparations Commission set German reparation obligations at roughly \$32.5 billion; at that point Germany had paid less than half its interim obligations. Germany accepted these reparation terms and raised funds for the initial payment by borrowing in London. German inflation grew, and the German mark lost its value rapidly. 1922, July: Germany requested a 2-year moratorium on reparation payments. The French government refused. 26 Dec. and 9 Jan.: The Reparations Commission declared Germany in default on reparations. 1923, 11 Jan.: As a result, France and Belgium occupied the Ruhr district. Oct.: A new bank, the Rentenbank, was established in Germany to issue new currency. Nov.: German currency reform; new German mark replaced the old mark at the rate of 1 new mark for every 1 trillion old marks. The successful currency reform had been accomplished by Hjalmar Schacht (b. 1877), president of the Rentenbank. 1923: Britain had lent the allies funds during the war, which the latter expected to repay through reparations; the U.S. had lent Britain money during the war, which it expected to have repaid; with the German defaults, the chain of debt repayments broke down. 1924, 9 Apr.: The Dawes Plan issued, prepared by a committee under American Charles G. Dawes (1865-1951); it provided for reorganization of the German Reichsbank under allied supervision, reduction of German reparation payments, a virtual morato-

rium on German debt payments for 1 year, a loan to Germany of 800 m. gold marks (of which \$110 m. would be raised in the U.S.); 1 Sept.: the Dawes Plan went into effect; Schacht became president of reorganized Reichsbank (serving until 1930). 1924: With the Nov. 1923 currency reform and the Dawes Plan, Germany seemed on the route to recovery; the nation returned to the gold standard. 1925, May: Britain went back to the gold standard at the prewar parity in relation to the dollar (\$4.86); 1926, 25 Oct.: Belgium returned to the gold standard. 1928, 25 June: French legislation brought France back to the gold standard. 1928: Restoration of pre-1914 financial conditions seemed achieved; yet the restoration was precarious.

International indebtedness: International long-term lending on the part of U.S., Britain, and France rose. Germany was by now an important debtor on international account, borrowing from abroad about 3 times as much as she paid out in reparations. The U.S. lent money to Germany for the latter to pay reparations, which allowed European countries to pay their war debts to the U.S. 1929, 7 June: The Young Plan, prepared by American Owen D. Young (1874-1962), aimed at a final settlement of the reparations question; it reduced German indebtedness to \$8 billion, payable over 58½ years. 1929, Oct.: U.S. stock-market crash, Nov. ft.: U.S. stock-market prices continued to fall; U.S. loans to Europe began to dry up. 1930: Bank suspensions in U.S. reached 1,352; losses to depositors, \$343.5 million. 1931, Mar.: When Germany made plans for a customs union with Austria, the French in opposition brought financial pressure on Austria and Germany. 11 May: The largest commercial bank in Austria, Kredit-Anstalt, failed. 5 June: German government memorandum mentioned the possibility of discontinuing reparations payments; foreign short-term funds, fearing disaster, fled Germany; Bank for International Settlements (established May 1930), Bank of England, Bank of France, and the U.S. Federal Reserve System loaned Germany \$25 m. to tide her over financial

collapse. 20 June: U.S. President Herbert Hoover proposed a 1-year moratorium on all reparations and war-debt payments. 7 July: French government accepted the Hoover proposal. 12 July: The important German Darmstädter and National Bank failed; run on other German banks; German government decided to close all banks and credit institutions in the country (banks were reopened 5 Aug.); Germany froze British short-term assets in Germany. 20-23 July: London conference of representatives of the U.S., Belgium, France, Germany, Italy, Japan, and the U.K. agreed to renew loans to Germany when they expired. July: Britain (because of blocked short-term assets in Germany and Central Europe) became a heavy borrower from abroad. French banks began to withdraw funds from London, as did other foreign banks, when rumors spread of possible financial difficulty. Aug.: Britain's reserves of foreign exchange reached a new low. 23 Aug.: British government resigned. 21 Sept.: Britain suspended the gold standard. 23 Dec.: Committee of the Bank for International Settlements reported Germany would not be able to make payment on reparations, due in July 1932. 1931: 2,294 bank suspensions occurred in the U.S.; losses to depositors came to \$391.2 million. 1932, 2 Feb.: Reconstruction Finance Corporation established in the U.S. with authority to provide emergency financing for U.S. banking institutions, life insurance companies, building and loan societies, railroads, and farm mortgage associations; Charles G. Dawes headed the R.F.C. 27 Feb.: In U.S. the Glass-Steagall Act passed, designed to increase the collateral the Federal Reserve could hold against Federal Reserve notes; government bonds as well as eligible paper were to serve as collateral; the act provided aid for individual banks, broadening the conditions under which they could borrow from the Federal Reserve. 16 June: International conference opened at Lausanne to discuss problem of German reparations and interallied debts; plans made were not ratified by governments involved. Germany never resumed reparations pay-

ments. 1932: Britain established an Exchange Equalization Account, through the operations of which it attempted to control fluctuations of the pound and the currencies tied to it; Britain, as leader of the so-called sterling bloc, took responsibility for stabilizing the currency of the bloc.

U.S. financial crisis: 1932: 1,456 bank suspensions in U.S.; losses to depositors, \$172.5 million. (The existence of the R.F.C. had stemmed the tide of bank failures temporarily.) 1933, Jan.-Feb.: Bank failures in the U.S. mounted; 4 Feb., Louisiana declared a 1-day bank holiday; 14 Feb., Michigan governor called for an 8-day bank holiday; 2 Mar., 21 other U.S. states had suspended or restricted banking operations. 4 Mar.: On Inauguration Day practically every bank in the U.S. was closed or under restriction by state proclamation. 5 Mar., 11 P.M.: The new U.S. President, Franklin Delano Roosevelt, issued a proclamation, dated Mon., 6 Mar., proclaiming a 4-day bank holiday and placing a 4-day embargo on gold, silver, and currency exports; although Secretary of Treasury William H. Woodin declared U.S. had not gone off the gold standard, this effectively took the country off gold, for it put gold out of reach. 9 Mar.: Emergency Banking Relief Act in U.S. approved the national bank holiday and other measures taken by the President; the act provided a plan for the reopening of all sound banks and gave the President broad powers over transactions in credit, currency, gold, and silver. 10 Mar.: U.S. executive order continued the prohibition against gold exports and dealings in foreign exchange, except under Treasury permission. 19 Apr.: Executive order took U.S. definitely off the gold standard, prohibiting gold exports unless they were shown to be "necessary to promote the public interest." 12 May: Thomas Amendment to the Agricultural Adjustment Act authorized U.S. Federal Reserve banks to purchase up to \$3 billion of government securities directly from the Treasury, and if they did not the President was authorized to direct the Treasury to issue

up to \$3 billion in greenbacks; the Thomas Amendment provided for devaluation by presidential proclamation of the gold content of the dollar by a maximum of 50%. 5 June: Gold Clause Repeal Joint Resolution; the gold clause in U.S. federal and private obligations was canceled; contracts and debts became payable in legal tender.

Increase in governmental controls: 1932, 12 June-27 July: World Economic Conference in London, avoiding discussion of the insoluble issues of war debts and reparations, sought to secure agreement on currency stabilization; the U.S. sent representatives, but the U.S. policy—with the removal of the gold standard just before the conference—was more national than international; the conference did nothing to restore international financial stability. 1933, 16 June: U.S. Banking Act (1) created the Federal Bank Deposit Insurance Corporation, for guaranteeing individual bank deposits under \$5,000; (2) prohibited the payment of interest on moneys in checking accounts in banks in the Federal Reserve System; (3) raised minimum capital requirements for national banks to \$30,000; (4) allowed branch banking by national banks, where it was permitted to state banks by state law; and (5) extended the open-market operations of the Federal Reserve Board—all of which measures were designed to cope with the U.S. domestic crisis. 25 Oct.: U.S. government set the price of gold at \$31.36 an ounce (as compared with \$29.01 an ounce on the world markets on 24 Oct.). 18 Dec.: Price of gold increased to \$34.06. 1933: France remained on the gold standard (until Sept. 1936); Germany kept an "artificial" parity and retained foreign-exchange controls. The National Socialist government in Germany completely repudiated its reparation obligations. European nations, which owed the U.S. \$10.3 billion (of which \$7.1 billion were war debts and \$3.2 billion were postwar loans), had repaid less than \$3 billion. 1933 ff.: Under Hjalmar Schacht, as president of the Reichsbank (1933-39) and as minister of economics (1934-37), Germany mobilized its finances for re-

armament; Schacht printed banknotes, manipulated currency (at 1 point, German currency was estimated to have 237 different values), and created credit within the nation; Schacht was considered to be a financial magician. 1934, 30 Jan.: Gold Reserve Act in U.S. gave the government greater control over dollar devaluation; the act placed the U.S. on a gold-bullion standard internationally and on an irredeemable paper standard domestically; it amended the Thomas Amendment to give the President the power to devalue the dollar to between 50% and 60% of its former gold value. 31 Jan.: President Roosevelt by proclamation officially devalued the dollar to 59.06% of its former value, and Secretary of Treasury Henry M. Morgenthau, Jr., announced that he would buy and sell gold at \$35 an ounce plus or minus $\frac{1}{4}$ of 1% handling charge. 13 Apr.: The Johnson Act in the U.S. prohibited loans by Americans to any foreign government that remained in default in its payments to the U.S. 5 Dec.: German law for regulation of credit put German banks under tight government control. 1935, Mar.: Belgium went off the gold standard, devaluing its currency. 23 Aug.: U.S. Banking Act of 1935—a purely domestic act—provided that (1) the title of the Federal Reserve Board be changed to the Board of Governors of the Federal Reserve System, (2) state nonmember banks having \$1 million or more deposits were required to become members of the Reserve System by July 1942 or forfeit their insurance benefits, and (3) an open-market committee composed of the Board of Governors and 5 representatives of the Reserve banks be created, these and other provisions made the Banking Act of 1935 an important step in the direction of central banking in the U.S.—the largest step since the passage of the Federal Reserve Act of 1913. 1936, July: Reform of the Bank of France, under which the French government got a leading voice in bank policies. (7 Aug.–25 Sept.: The Bank of France lost \$320 m., principally to the U.S. and England.) 25 Sept.: Tripartite Currency Agreement

between France, Great Britain, and the U.S. announced; these countries agreed to co-operate in the stabilization of currencies; this was a key move toward joint action in monetary and exchange matters; 26 Sept.: France virtually suspended the gold standard; 27 Sept.: Holland left gold; 28 Sept.: Switzerland left gold. 1 Oct.: Legislation in France authorized suspension of the gold standard law of 25 June, 1928, thus officially devaluing the franc; U.S. arranged with Great Britain and France for the purchase and sale of gold through stabilization funds of these countries, with the aim of reducing fluctuations between their currencies. 1937, June: Gold began to flee France; the franc declined. 1 July: France removed the legal limits on exchange fluctuations. 1937–38: French franc gained value in late 1937 (with reaffirmation of the Tripartite Agreement), but declined again in 1938. 1939, 20 Jan.: Walther Funk replaced Schacht as president of the Reichsbank in Germany; 24 Mar.: Germany undertook a new inflationary financial program; German foreign-exchange controls remained in force; remittances remained blocked.

World War II measures: 1939, Sept.: With the coming of the war, new controls on foreign exchange were imposed. The British pound, which had declined from \$4.86 to \$3.20 after the Sept. 1931 devaluation and had risen up to \$4.90 before World War II, was now fixed at \$4.03. 1940: U.S., France, and Great Britain recognized that to deal with the disruption of trade and payments in the 1930's a properly functioning international payments system was required; the experiences of the 1930's indicated that the *ad hoc* steps taken by individual states were inadequate, but solutions were not yet at hand. 1940, Apr.: When Germany invaded Denmark and Norway, U.S. froze the assets owned by these countries in the U.S., to prevent American funds and property of these countries being utilized by Germany and to protect them for their owners. (As other areas were occupied by Germany, U.S. followed the same procedure.) June: With Ger-

man occupation of France, the Tripartite Agreement became inoperative; it had, however, been an early stage in international co-operation. 1942, Aug.: John Maynard Keynes proposed an International Clearing Union, equivalent to an international central bank. 1944, Apr.: Agreement was reached between the U.S. and the U.K. on the establishment of an International Monetary Fund. July: At Bretton Woods, N.H., plans were made by 44 nations for such a fund; plans were also made for a world bank. 1945, 27 Dec.: Articles of Agreement for the International Bank for Reconstruction and Development (the World Bank) and for the International Monetary Fund were signed by 30 countries.

FOREIGN TRADE. 1920's: World War I disrupted commerce. 1920: The current value of U.S. exports reached an all-time high, not to be exceeded until 1948. The high figures reflected postwar inflation and worldwide demand. 1921: With the recession there was a sharp drop in demand. 1924: Measured in terms of *constant* purchasing power (1913 currencies as base), the value of foreign trade of France had risen 9%, 1913-24, while British trade had declined 3% and that of Germany 42%. 1928: All the mature industrial nations were exporting more (in current values) than in 1913; yet Britain, which had in the pre-World War I years depended on foreign trade to stimulate prosperity, was in a poor position; if the export values for Britain are recalculated in terms of 1925-29 prices, then, 1927-29, the average real value of British exports ran to about 84% of the 1913 level. When in 1925 Britain had returned to the gold standard, the pound was overvalued—thus imports were cheap and exports expensive; British goods had difficulty competing abroad. Textile industries in less developed countries and Japanese output created competition with British textiles overseas. British coal exports lagged. By contrast, when France returned to the gold standard in 1926, the franc was undervalued, and French exports rose as a result. 1926-29: U.S. foreign trade exceeded British

foreign trade and the U.S. became the world's largest trader.

Trade restraints in the 1920's: 1920's: Tariffs to some extent impeded the trade of industrial countries, but not in a major fashion. 1920: Britain decided on a complete prohibition of imports of dyestuffs and coal-tar dyes to protect its domestic chemical industry and to bar the revived German industry. 1921, 3 Apr.: France passed a temporary tariff, raising duties 5 times their 1910 level; 27 May: Emergency Tariff Act in the U.S., with dye licensing provisions and embargoes on oxalic and formic acids, amyl and butyl alcohols, butyl acetate, and fusel oil, aimed to protect America's new chemical industry; this act also raised duties on agriculture; the act contained antidumping provisions, which provided for special duties on goods sold in the U.S. at lower prices than they were sold abroad; 12 Aug.: Britain also passed an antidumping act; 1 Oct.: Safeguarding of Industries Act in Britain extended the range of wartime McKenna duties, which were retained; under the new British act, customs duties were collected on 6,000 imported articles. 1922, 21 Sept.: Fordney-McCumber Tariff (U.S.) imposed higher duties on agricultural products, raised other rates, and gave the U.S. President the power to alter duties as much as 50% to equalize foreign and domestic costs of production, this act contained the highest duties in American history. 1924: Minor reductions in duties in England, but duties reimposed in 1925. 1925, 11 Jan.: High tariff protection given to agriculture in Germany, as Germany enacted a tariff of the same type as its 1902 tariff. 1926, Apr.: France raised all import duties by 30%; Aug.: France again raised all import duties by 30%. 1927: Further increase in French duties, but modifications were made through tariff negotiations. 1929: Customs duties had risen in the mature industrial countries well above the 1919 level, but nowhere were the duties prohibitive.

1930's: 1930-33: Sharp decline of trade with worldwide depression. 1933 ff.: Attempts at trade recovery, but in a context

of restraint; Britain regained leadership in world foreign trade, followed by U.S., Germany, and France. »

Trade restraints in the 1930's: 1930-33: Trend worldwide toward trade restrictions, tariffs, exchange controls, quotas, and licensing. 1930, 17 June: Hawley-Smoot Tariff became law in the U.S.; it increased U.S. tariff rates to their highest level in 20th cent.; this tariff provoked retaliatory action by other countries. 1931, May: France became the 1st nation during the depression to adopt "quantitative restrictions" on trade, i.e., to put quotas on imports. (By 1934, 3,000 articles were on the French quota list.) 1932: U.S. introduced "import excise taxes," which were tariffs by another name, on copper, petroleum, coal, lumber, oils, and fats. 1932, Feb.: With the Import Duties Act, Britain instituted quotas; Britain was finally fully committed to a protective tariff policy; 21 July-20 Aug.: at the Ottawa Conference various parts of the British Empire accepted increased imperial preference; the result of the conference was a higher external tariff for the empire (including Britain). 1932: France gave preferential tariff concessions to its colonies. 1933 ff.: Germany expanded export trade to the Balkans and Latin America. Policies of "bloc trading" came into evidence: Britain with its empire, France with its empire, Germany with selected regions, and the U.S. to a greater extent with Latin America 1933: With the depression and trade restraints, foreign commerce of the major industrial nations sank to a nadir. 1933: U.S. exports were a mere 37.9% of the 1929 level, while imports were 35.8% of that level. 1933-34: Britain made bilateral commercial treaties to reduce tariff barriers with Scandinavian and Baltic countries. 1934, 12 June: U.S. sought to stem the tide of rising trade barriers with the Trade Agreements Act, a turning point in U.S. tariff history; it authorized the President to enter into reciprocal trade agreements with other governments for reduction of specific duties by as much as 50%. 1934 ff.: U.S., under this act, made a series of bilateral agreements aiming toward freer trade, but the for-

eign trade of the U.S. and of the industrial nations in Europe recovered slowly; economic nationalism' was the norm. 1937: British exports reached their peak for the decade (83% of the 1929 level; at no time in the 1930s did British exports exceed their 1913 level). 1938: British exports represented a new low as a percentage of British industrial output: 1924, 27%; 1930, 22%; 1935, 17%; 1938, 15%. German government policy of self-sufficiency discouraged imports; the Germans encouraged exports through (1) direct export subsidies, (2) rewards of various sorts to exporters, (3) barter agreements, and (4) manipulation of exchange rates. Exports did rise as a result. 1939-45: International trade came to be shaped by the patterns of war deliveries. 1940, July: U.S. started export control; 1941, Apr.: almost half of U.S. exports had to be licensed (arms, ammunition, certain machine tools, chemicals, raw materials); Dec.: all U.S. exports became subject to license after U.S. entered the war. Britain and Germany also put on restraints of trade designed to meet wartime requirements.

FOREIGN INVESTMENT. 1920's: The principal capital markets were New York and London. Americans made foreign investments as never before. 1929: U.S. foreign investments had a book value \$17.2 billion; those of Britain were \$18.2 billion, this total of \$35.4 billion represented the bulk of international investments. (France had \$3.5 billion invested abroad, the Netherlands \$2.3 billion, Germany \$1.1 billion, Switzerland \$2 billion, and other countries, including Canada, Belgium, Sweden, Japan, India, Australia, and New Zealand, together totaled \$5.7 billion.)

1929-33: U.S. capital market evaporated; 1934-40: the U.S. was a net importer of capital. 1932-37: There was a general disenchantment in Britain with foreign investment, Britain became a net importer of capital. 1937: The value of U.S. foreign investments had dropped to \$11.8 billion, while British foreign investment (converted at the exchange rate at end of year) had grown slightly to \$18.8 billion.

FOREIGN INVESTMENT POSITION, 1938
(\$ million)

	<i>Credits</i> (Foreign Investments Abroad)	<i>Debts</i> (Foreign Investments Within Nation)
U.K.	22,905	1,299
U.S.	11,491	7,007
France	3,859	559
Germany	676	2,743

1939-45: With the war, Germany lost almost all its foreign assets. At war's end the U.S. and Britain still ranked as the world's largest creditor nations. Together they controlled foreign assets of about \$29.5 billion compared with \$35.4 billion in 1929 and \$34.3 billion in 1938.

FOREIGN AID. 1941, 11 Mar.: U.S. Lend-Lease Act aided Britain in supplying her dollar requirements; goods were supplied to Britain without immediate payment. 1941, 11 Mar.-1945, Aug.: U.S. lend-lease aid came to \$43,615 m., of which \$30,073 m. went to the British Empire (mostly to Great Britain) and \$10,670 m. went to USSR. Reciprocal aid to the U.S. from the British Empire came to \$7,567 m.

BUSINESS ORGANIZATION. The methods of business organization developed in the U.S. spread to Europe. 1920's: More use of the corporate form in Europe. The "rationalization" movement assumed popularity in Western Europe, with conferences, discussions, and study groups established to apply the techniques of scientific management; linked with this was the diffusion to Europe of American ideas on mass production of standardized products. In the U.S. innovations in business organization included (1) the increased use of the pyramided holding-company structure in utilities, which served to centralize control; (2) the introduction by Du Pont and General Motors of a form of organization structure for business enterprises—comprising a central staff and multidivisional operating units, designed to provide efficient use of resources within a large corporation; (3) the more frequent use of committees within a business organization, in place of a 1-man decision making system; and (4) the spread of research laboratories

within business enterprises (the earliest ones were before World War I, but only in the 1920's did they become common). 1925-29: 2nd large wave of corporate mergers in the U.S.; the corporate form provided continuity of business organization and a means of facilitating mergers. In the U.S. the corporation had become the way of doing business. 1929: In large American corporations, there was increasingly a separation of ownership and management control. This was more the case in the U.S. than in Europe, because of (1) the greater use of the corporate form, (2) the longer use of the corporate form, and (3) the growth in the U.S. of enterprises to a larger scale. In Europe too the age of the giant enterprise was emerging. 1925, 28 Nov.: Formation of I. G. Farbenindustrie A. G. in Germany. 1926, Oct.: Sir Alfred Mond united Brunner-Mond, United Alkali, British Dyestuffs Corp., and the Nobel Industries into Imperial Chemical Industries, Ltd. 1926: Vickers-Armstrong, Ltd., munitions makers, was founded. 1929, Jan.: Associated Electrical Industries founded in Britain, merging several of the key British electrical companies. 1930: Establishment of Unilever, Ltd. In Germany, the cartel form of operation continued, sometimes encouraged by the German government. International cartels also became more prevalent. International business enterprises—single companies with business stakes worldwide—came into new prominence. 1930's: Americans, seeking explanations for the depression, asked new questions about corporate organizations, concentration of corporate power, and the role of the large business enterprise. 1932: Estimated 2,400 cartels in Germany. 1933 ff.: Under National Socialism in Germany, the tendency of business organiza-

tion was toward more combination, greater co-operation, and less competition; compulsory cartels became prevalent in Germany. 1930's: The decline of competition was also evident in Britain. In France, with general stagnation there was little change in private business organizations, although the government played a far larger role in business. 1930's: Americans began to fear the decline of competition (pp. 769-770 below).

GOVERNMENT POLICY. General: 1919-26: The French government, expecting Germany to cover the bill (with reparation payments), put large sums of money into reconstruction of devastated areas, which encouraged economic expansion in France.

**FRENCH CENTRAL GOVERNMENT EXPENDITURES
AS % OF NATIONAL INCOME**

	<i>Estimates</i>
1920	47.5
1921	28.1
1922	29.6
1926	27.9

In Britain the government played a less significant role in generating investment, after the war, most government intervention stopped. 1922-26. British central government expenditures, however, ran just over 20% of national income, with the expenditures mainly on payments of the national debt, defense, and veterans' pensions. In the U.S., Republican governments held to the motto "less government in business, more business in government", 1920, 1 Mar.-5 June. Merchant Marine Act (Jones Act) provided for sale of U.S. government owned ships to private interests. 1922-26. U.S. federal government expenditures were about 4% of national income. Germany, trying desperately to recover from its wartime losses, found its domestic policies shaped by international conditions. 1920. German state railways became the property of the Reich; 1921: on the recommendation of the Dawes Plan, private companies undertook to operate the German railroads on 40-year leases. 1926-29: Except in respect of aid to agriculture, in some

cases tariffs, and in Britain aid to exports, there was no marked increase in governments' role in the economies of the mature industrial nations. 1929-39: With the depression and postdepression attempts at recovery, governments of mature nations took on a more important role, trying for the 1st time to provide extensive aid to the able-bodied unemployed. 1933 ff.: The New Deal in the U.S. inaugurated greater government participation; the National Industrial Recovery Act introduced government-industry planning (which lasted 1933-35). 1933, 1 May Adolf Hitler outlined Germany's 1st 4-year plan, aiming at lowering unemployment and increasing economic advance. 1935 ff.: In the U.S. government-industry planning was abandoned, and more reliance was placed on the market mechanism, including a government role in regulation and welfare. 1935-36: The British government's activities in supervising, co-ordinating, and planning industrial expansion began to increase. 1936 ff.: In France under the Popular Front government, state intervention took the form of welfare measures and direct participation. 1936, Sept.: Hitler announced Germany's 2nd 4-year plan, which involved more extensive planning than had ever been undertaken in the U.S. or Western Europe; state control and interference sought to make Germany self-sufficient in raw materials, encourage industries, prompt technological changes, and use existing resources efficiently. Hitler and Hermann Göring indicated that the 4-year plan involved sacrifices; workers had to put aside wage increases, business to accept curtailment of freedom of action, everybody to pay higher taxes; in return the state promised Germans security from enemies in time of war, economic strength, and a higher standard of living in the long run. The German 4-year plan was directed toward developing Germany's economic capacity to fight a war. 1938: With the recession in the U.S., President Roosevelt was prepared for the 1st time consciously to employ fiscal policy as an aid to recovery; U.S. regulation of business enterprise increased. 1940-45: Wartime governments'

involvement in economic matters soared in the U.S., Germany, and Britain; 1944: after liberation, Ministry of National Economy established in France, and wave of nationalization began.

Aids to agriculture: The pleas of the farmer in the mature industrial nations made government aid seem essential. 1921: U.S. 1st postwar tariff gave special protection to agriculture. 1922, 18 Feb.: Co-operative Marketing Act (Capper-Volstead Act) in U.S. exempted agricultural producers, co-operatives, and associations from antitrust laws. 1923, 4 Mar.: Intermediate Credit Act in U.S. sought to facilitate loans for crop financing, it established 12 intermediate credit banks, each with a capital of \$5 million subscribed by the government; each bank was authorized to make short-term loans (6 months to 3 years) to agricultural co-operatives, the act also authorized the creation by private capital of agricultural credit corporations. 1924, 24 Aug.: Agricultural Credits Act provided for government loans to dealers and co-operatives to permit them to withhold commodities from domestic and foreign trade in an effort to prevent bankruptcies and dumping. 1925: German agricultural tariff rose sharply; British Sugar (Subsidy) Act was passed, under which Britain provided subsidies to its beet-sugar industry. 1929: German legislation made provisions for agricultural credits. 1929, 15 June: Agricultural Marketing Act, in U.S., established a Federal Farm Board to promote marketing of farm commodities through agricultural co-operatives and by stabilization corporations. 1930: In U.S., Federal Farm Board created Cotton Stabilization Corp., Grain Stabilization Corp., and Wool Marketing Corp. 1931: British Agricultural Marketing Act established an agricultural marketing board; Wheat Act in Britain guaranteed wheat prices. 1932, 2 Feb.: Reconstruction Finance Corp. in U.S. authorized to loan money to farm mortgage associations. 1933: Agricultural Marketing Act in Britain placed new restraints on agricultural imports; under the act, schemes were established for marketing potatoes, pigs, and milk. 1933 ff.: Under the New

Deal in the U.S. and under National Socialism in Germany, new aids to farmers. 1933 ff.: In addition to high protective duties, France established extensive support programs for wheat, wine, sugar beets, and some other crops. 1933, 27 Mar.: Farm Credit Administration set up in the U.S. by executive decree; 12 May.: Agricultural Adjustment Act in U.S. sought to guarantee a fair return to agriculture and to restore the purchasing power of the farmer; it introduced the concept of parity prices (based on 1909-11 period); it aimed to eliminate surplus crops through compulsory curtailed production; for the 1st time the American farmer was subsidized (1936: Supreme Court ruled the act unconstitutional). 2 June: German Law for the Reduction of Unemployed contained provision for national funds to be spent on agricultural activities; sums spent out of profits for improvement of agriculture were made exempt from income tax. 16 June: Farm Credit Act in U.S. gave the farmer the opportunity to refinance farm mortgages on long terms at low rates. Aug.: U.S. participated in International Wheat Agreement. 18 Oct.: Commodity Credit Corp. established in U.S., authorizing the use of Reconstruction Finance Corp. funds for loans to farmers. 1933-34: German agriculture was completely reorganized under the Food Estate (Reichsnährstand), which included landowners, tenants, cultivators, agricultural workers, processors of foodstuffs, and wholesale and retail traders in agricultural produce, as well as all agricultural co-operative societies and farmers' organizations; German agriculture was rationalized; state control and guidance of marketing associations was established; the Germans sought self-government of agriculture under state supervision. 1934: British introduced subsidies for cattle raisers; Germans started a "battle for production" of agricultural output with extensive government subsidies. 31 Jan.: Farm Mortgage Refinancing Act in U.S. established Federal Farm Mortgage Corp., 23 Feb.: Crop Loan Act in U.S. allocated more funds for loans to farmers. 21 Apr.: Cotton Control Act in U.S. provided for

compulsory reduction of surplus cotton crops. 9 May: Jones-Costigan Sugar Act in U.S. sought to limit sugar production. 28 June: Federal Farm Bankruptcy Act in U.S. gave new relief to farmers, providing means of obtaining credit, it suspended bankruptcy proceedings for 5 years (act declared unconstitutional in *Louisville Joint Stock Land Bank v. Redford*, 1935). 28 June: Tobacco Control Act in U.S. provided for compulsory reduction of surplus tobacco crops. 1935, 29 Aug.: Farm Mortgage Moratorium Act in U.S. offered a 3 year moratorium on seizure to debt-burdened farmers. 1936, 6 Jan.: In U.S., Agricultural Adjustment Act of 1933 declared unconstitutional (*U.S. v. Butler*); 29 Feb.: Soil Conservation and Domestic Allotment Act in U.S. provided benefit payments to growers who co-operated with the government soil-conservation program, payments related to the acreage withdrawn from production (this was designed to replace the unconstitutional AAA legislation), there was to be no compulsion. Sept.: 2nd German 4-year plan aimed at agricultural self-sufficiency, cutting food imports and developing agriculture; government funds were allocated for land improvement; prices of fertilizers were artificially lowered; credits were provided farmers for purchase of machinery and fertilizers; attention was paid to better agricultural practices, agriculture prices were artificially raised to encourage production of potatoes and sugar beets. 1937: In Britain, legislation guaranteed prices for oats and barley; producers of fertilizers were subsidized by the government. 1938, 16 Feb.: New Agricultural Adjustment Act in U.S. sought to curb farm surpluses; the secretary of agriculture could fix marketing quotas and authorize acreage allotments to farmers; as in the 1933 Agricultural Adjustment Act, the parity principle was repeated, this act established the concept of the "ever-normal granary"; the U.S. government would store excess crops and only when the price was above parity would these be marketed; the act authorized the creation of the Federal Crop Insurance Corp.

Aids to industry: 1918, 10 Apr.: Webb-Pomerene Act passed in U.S., an act to promote export trade; it allowed exporters to combine without being subject to U.S. antitrust laws. 1919: German Coal Act was designed to merge the entire German coal industry into a national compulsory cartel, supervised by the German government; under this legislation there was a rationalization of the German coal industry. 1920's: In Britain, where the coal industry was ailing, the government sanctioned restrictive agreements among coal producers and the fixing of production quotas, export subsidies were paid by the government. 1921 ff.: Tariff protection of industry in the U.S. and in Western Europe. 1928: British established an Export Credits Guarantee Department. 1930: Coal Mines Act in Britain endorsed earlier restrictive measures in industry and introduced a marketing scheme for coal, including quotas, export markets, and minimum prices, this amounted to a government-sponsored cartel. 1933, 20 Feb.: Hitler in Germany made promises to industrialists to aid them, and asked that they assist him; Apr.: taxation on all new motor cars removed in Germany to encourage that industry; 2 June: Law for the Reduction of Unemployment in Germany contained tax aids to firms that raised capital expenditures and increased employment. 16 June: National Industrial Recovery Act in the U.S. sought to raise prices and encourage industrial expansion, the act employed the concept of industrial self-regulation (with industry codes) under government supervision; the act created the National Recovery Administration. (1935: The U.S. Supreme Court declared the code provisions of the act unconstitutional in *Schechter Poultry Corp. v. U.S.*). 1933 ff.: British government supported rationalization proposals in the shipbuilding, tin-plate, and wool-combing industries. 1934, 2 Feb.: Export-Import Bank established in U.S. to provide industry with credits for exports to the newly recognized Soviet Union (this bank never functioned in this capacity); 12 Mar.: a 2nd Export-Import Bank was established in the U.S. to provide credits for Ameri-

can exports to Cuba and then to other countries (1936, the 2 Export-Import banks became 1): 1935, 21 May: Defense Law passed in Germany (Schacht was appointed plenipotentiary general for war economy); under the law, encouragement of industrial development, especially munitions factories and armaments. 1935 ff.: British government began to aid the nation's steel industry. 1936, Sept.: 4-year plan in Germany; Hermann Göring in charge; export subsidies were given to industries and industry was urged to expand. 1937: British steel industry discussed planned price changes with the government's Import Duties Advisory Commission, which favored the industry's needs. 1939: Cotton Industry (Reorganization) Act passed in Britain sought to reduce competition in the British cotton industry. The attempts by government to reduce competition were seen as aids to industry.

Aids to transportation: 1920's: The British subsidized their airlines, as did the U.S. 1928, 22 May: Merchant Marine Act (Jones-White Act) in the U.S. was designed to encourage private shipping. 1933: Road and Rail Traffic Act in Britain sought to reduce competition on the railroads. 1936, 26 June: Merchant Marine Act in U.S. provided outright subsidies to develop domestic shipping. In every mature nation, governments built new highways. 1944: In the U.S., Federal Aid Highway Act provided federal assistance for the building of a national system of interstate highways and federal aid to primary and secondary road construction.

Other government aids: 1919: British passed an act to encourage home building, guaranteeing local authorities against losses on approved municipal projects. 1920, 10 June: Water Power Act in U.S. established a Federal Power Commission, which was authorized to issue licenses (limited to 50 years) for the construction and operation of facilities to improve navigation and to develop and utilize power facilities (such as powerhouses, dams, reservoirs, and transmission lines) on U.S. public lands; the commission was empowered to regulate rates and security issues of such licensees. 1923: Chamber-

lain Act in Britain provided for 20-year annual subsidies of £6 on new (suitable) houses; 1924: Wheatley Act raised the subsidy to £9 per annum for 40 years. 1930: Housing Act in Britain gave financial aid for slum clearance. 1932, 2 Feb.: Reconstruction and Finance Corp. established in U.S., which would provide emergency financing for banking institutions, life insurance companies, building and loan societies, railroads, and farm mortgage associations. 21 July: Relief and Construction Act in U.S. extended the functions of the R.F.C. 22 July: In the U.S., Federal Home Loan Bank Act established a Home Loan Bank Board and authorized the establishment of 8 to 12 banks for home mortgages. 1933, 31 Mar.: Civilian Conservation Corps Reforestation Relief Act in U.S. involved the government in public works programs, designed to cut unemployment. 1 May: German 4-year plan announced by Hitler provided a range of public works measures. 12 May: Federal Emergency Relief Act in U.S. authorized grants to states and municipalities for the administration of relief. 13 June: Home Owners Refinancing Act passed in U.S., which created the Home Owners Loan Corporation; act provided means for refinancing home mortgage debts for nonfarm owners. 16 June: Title II of the U.S. National Industrial Recovery Act provided for a federal emergency administration of public works to be established by the President; Roosevelt set up the Public Works Administration, under Secretary of Interior Harold L. Ickes (1874-1952); this section of the act was not considered to be unconstitutional and continued after the code provisions of the act were rejected by the U.S. Supreme Court. 8 Nov.: Civil Works Administration established in U.S. as an emergency unemployment relief program. 1934, 15 Feb.: Civil Works Emergency Relief Act authorized \$950 million in U.S. for civil works and direct relief. 27 Apr.: In the U.S., Home Owners Loan Act authorized funds for the refinancing of home mortgages. 28 June: National Housing Act in U.S. was designed to stimulate residential construction; it provided for the establishment of

the Federal Housing Administration for the purpose of insuring loans made by banks, trust companies, building and loan associations, and other private lending institutions for new construction and improvements. 1935: Housing Act in Britain authorized local authorities to plan housing projects. 8 Apr.: Emergency Relief Appropriation Act in U.S. provided for the establishment of large-scale public works programs for the jobless; it authorized the establishment of the Works Progress Administration (renamed Works Project Administration in 1939). 26 June: National Youth Administration created as part of the Works Progress Administration to superintend work-relief and employment programs for persons between 16 and 25 years of age. 14 Aug.: Social Security Act broadened the U.S. government's aids to the unemployed and to the aged.

Regulation, rationalization, and control: 1933, 27 May: Federal Securities Act ("Truth in Securities" Act) in the U.S. made corporations disclose in detail relevant information relating to new securities issues offered the public. 1933, 16 June: Under the National Industrial Recovery Act in the U.S., the American government sought to supervise industry, to raise prices, and to develop a system of industrial self government. 1934, June-Dec.: German government sought to control prices of industrial goods; the National Socialist government organized industry into 13 groups, each with subgroups, with the whole structure under the Ministry of Economics; the goal was industrial self-government, the management was left to private enterprise; general direction and planning were by the state; compulsory cartels were formed in Germany in 26 important industries. 16 June: Emergency Railroad Transportation Act in U.S. provided for financial reorganization of the carriers, avoidance of unnecessary duplication of services and facilities, and other means of improving conditions of rail transportation, the act authorized a new office, the Federal Coordinator of Transportation. 1934: Dividends Limitation Law in Germany, designed to encourage industries to reinvest

profits. 6 June: Securities Exchange Act in the U.S. established a Securities and Exchange Commission; act provided for federal regulation of the stock exchanges; all issues of securities offered the public (not just new issues) required full disclosure of relevant information. 19 June: Communications Act in U.S. established the Federal Communications Commission (FCC) for regulation of interstate communication by telephone, telegraph, cable, and radio. 1935, 26 Aug.: Public Utility Holding Co. Act (Wheeler-Rayburn Act) in U.S. put public utilities under federal regulation; all utility holding companies had to register with the Securities and Exchange Commission; the act required utility holding companies to simplify their corporate structure and to eliminate pyramiding; the act also gave the U.S. Federal Power Commission authority to regulate the transmission and sale of electric power in interstate commerce. 1936, 19 June: Robinson-Patman Act in U.S. was designed to protect small retail businesses against the large chain stores; it made illegal price discrimination between different purchasers of commodities of like grades and qualities, where the effect was to lessen competition or to create a monopoly. June: Price regulation adopted in France, in an effort to obtain price stability after the introduction of new social legislation. Sept.: Under a new German 4-year plan there was large increase in government regulation. 1936-37: Enlarged British government regulation, including some price controls. 1937, 17 Aug.: Miller-Tydings Resale Price Maintenance Act in U.S. protected small retailer; it amended the U.S. antitrust laws to legalize contracts made between producers and distributors, which involved maintenance of resale prices of branded nationally advertised goods traded in interstate commerce. 1938, 16 June: Temporary National Economic Committee (TNEC) established in the U.S. to look into concentration of corporate power. 1939 ff.: Department of Justice in the U.S. initiated a series of antitrust suits against giant American enterprises. The attempts of the U.S. government policy, 1936 ff., to protect

and encourage small business had no counterpart in Europe, where the thrust of government policy was toward rationalization and elimination of competition. European governments' controls sought larger-scale, more efficient business enterprises, while the U.S. government sought to safeguard competition and return to the classical free-market economy. 1939, spring: French government assumed authority over entire economy, in the belief war was imminent. 21 Aug.: British Parliament passed the Emergency Powers Bill, giving the British government key powers over all facets of the economy; the British Treasury ordered all owners of foreign securities to return their holdings to the Bank of England within 30 days; this gathering of foreign assets was to obtain resources with which to buy needed materials from abroad. 1 Sept.: British Currency (Defense) Bill passed, which provided that funds from the Exchange Equalization Account could be utilized for war needs. Nov.: Britain adopted a broad price-control law, Prices of Goods Act. During the war, for ever, participant regulation and control expanded.

Direct participation in industry: 1920: The operation of the potash properties in Alsace, returned to France under the Treaty of Versailles, went under a "national industrial office," *Les Mines Domaniales de Potasse d'Alsace*, administered by a French government office; a French government agency also started to manufacture synthetic ammonia, taking over from a German firm the patents for the Haber process. 1924: French government participated in a group of "mixed" industry-government cos. in the Alsace territory. 1933-34: German government chose the route of supervision rather than direct participation; the state actually divested itself of certain direct participations. 1934, 8 Mar.: Hitler at Berlin automobile show made 1st suggestions for the *Volkswagen*. 1936, Aug.: With the establishment of the Popular Front in France there was accelerated state participation; law in France authorized 3 defense ministries to nationalize enterprises

in munitions and aircraft industries. 1936, Sept. ff.: Under 4-year plan in Germany new government-owned enterprises began to make synthetic rubber, textiles, fuel, and other products from Germany's own resources, designed to make Germany self-sufficient; Hermann Göring Works was built by the German government to make steel by a new process from local low-grade ore. 1936: In Britain the Air Ministry started the "shadow factory" plan, new plants to be built by the government and operated by cos. in the automobile industry to manufacture parts for aircraft engines. 1940-45: With the coming of the war, government direct participation increased, the making of the atomic bomb at Oak Ridge, Tenn., was a U.S. federal government project; the German government participated directly in research on and manufacture of V-1 and V-2 missiles. Government and/or government-financed plants to build aircraft existed in all the mature nations. Governments financed new factories to fill war needs. 1940-45: U.S. government financed new plant construction, so that by the end of the war 90% of the plants for synthetic rubber, aircraft, magnesium, and shipbuilding, 70% of the aluminum capacity, and 50% of the machine-tool facilities were U.S. government-owned. 1944-45: Wave of nationalizations in France. 1944, Oct.: The holdings of Louis Renault, who was accused of having collaborated with the Germans, were nationalized; a new co., Régie Nationale des Usines Renault, owned by the state, was established. Jan. 1945. 18 Dec.: Coal-mining companies in northern France were merged into a single public enterprise, Houillères du Nord et du Pas de Calais. French nationalization continued in 1945-46.

Direct participation in other sectors: 1926: Electricity (Supply) Act passed in Britain, establishing a Central Electricity Board, to own and operate a national transmission system known as the "grid"; this spurred development of electric power on a national basis. 1933 ff.: In the U.S. and Germany, governments became involved in large-scale public works programs, designed to eliminate unemployment.

ment and revive the economy. 1933, 18 May: Establishment of the Tennessee Valley Authority (TVA) in the U.S. as an independent public corporation, authorized to construct dams and power plants and to improve economic and social conditions in the Tennessee Valley region (including 40,000 square miles in the states of Tenn., N.C., Ky., Va., Miss., Ga., and Ala.); this was the U.S. government's 1st entry into electrical power production. TVA would produce, distribute, and sell electric power and nitrogen fertilizer to the region's residents and industry (1933-40: Congress appropriated \$270 million for TVA's activities). 1933: Roosevelt authorized the use of Public Works Administration funds for the construction of the Grand Coulee Dam on the Columbia River as part of a plan for the development of the Columbia Valley. 1933-40: Other power developments by the U.S. federal government included the completion of the Boulder Dam on the Colorado River, the Fort Peck Dam on the Missouri River (in Montana), and the Bonneville Dam on the Columbia River. 1935, 11 May: Rural Electrification Administration was established in the U.S., by executive order, to administer a program of generating and distributing electricity in isolated rural areas not served by private utilities. These measures, involving the U.S. in public utilities enterprises, had worldwide impact; from France to Latin America, governments took part in large-scale hydro-electrical developments. 1937, Aug: Nationalization of the railroads in France; Société Nationale des Chemins de Fer Français established to administer a unified railroad system (51% owned by the state, 49% owned by private capital). 1940-45: General wartime participation of the governments was extensive. 1940-45: In U.S. 3,800 miles of oil pipelines were constructed by the government to carry petroleum to the East Coast, one of many types of direct participation.

OTHER FACTORS. 1936: John Maynard Keynes (1883-1946) published *General Theory of Employment, Money*

and Interest, introducing the "new economics"; using Keynesian ideas, economists in the U.S. and abroad would in time demonstrate a new role for government.

MEASURES OF ECONOMIC GROWTH.

REAL NATIONAL INCOME PER CAPITA, 1920-46

The Drive Toward Maturity—USSR, Canada, Australia, Japan, Etc.

During the period 1919–45 the Soviet Union, Italy, Canada, Australia, and Japan (and some other countries) took large strides along the path to industrial maturity.

AGRICULTURE. 1919: The USSR, Italy, and Japan (but not Canada or Australia) had over 50% of their labor force in agriculture. 1940: In none of these countries (except the Soviet Union) was over 50% of the labor force in agriculture.

% OF LABOR FORCE INVOLVED IN
AGRICULTURE, FORESTRY, FISHERIES

	1920–29	1930–39
Australia	20	17
Canada	36	32
Italy	56	48
Japan	53	49
USSR ^a	85	59

^a Soviet figures are for 1925 and 1940.

AGRICULTURAL LABOR FORCE
IN OTHER SELECTED COUNTRIES

	% of Total Labor Force
New Zealand (1945)	20
Denmark (1940)	29
Norway (1930)	35
Czechoslovakia (1947)	38
Austria (1939)	39

Agricultural progress: 1920's: The low agricultural prices experienced by farmers in the mature industrial nations adversely affected the newly industrial nations, with these major exceptions: (1) In Canada and Australia—based on available land—wheat acreage expanded. 1923–28: Canadian wheat acreage grew by 3 m. acres. Costs were low and western Canadian farmers prospered despite similarly low agricultural prices. 1919: 6.5 m. acres were planted with wheat in Australia; 1929, 15

m. acres in wheat in Australia; here too expansion occurred despite lower price.

(2) Russian agricultural output began slowly to turn upward, 1922–28 (as the government left the individual farmer on his own). Most of this output was absorbed by domestic consumption. 1927–31: Large rich harvests in Japan sent rice prices down to their nadir. 1929 ff.: All the newly industrialized nations felt the depression severely. 1930: With the virtual closing of the American market for Japanese silk, prices dropped drastically. 1930 ff.: Soviet agriculture stagnated because of the depression and peasant opposition to collectivization. 1932–33: Famine in Russia.

1939	121

1930 ff.: Canadian wheat production sank into the doldrums; depression, drought, crop failures, and foreign tariff barriers had a disastrous impact on the wheat farmer. (1929–36: The Saskatchewan wheat crop averaged only 60% of the preceding 5-year period; wheat prices were about 56%.) The plight of the wheat farmer affected the rest of the

Canadian economy, causing the 1930's to be a time of national stagnation. 1930's: Australian acreage in wheat production declined from the 1930-31 high of 18 m. acres to 12 m. acres, 1934-37, and then rose to 14 m. acres, 1938-39. 1930's: Japanese agricultural output rose slowly, aided to a small extent by the government; Italian output in agriculture expanded significantly, mainly because of government assistance and protection. 1930's: On the whole, the decade saw few benefits accruing to the farmer in the newly industrialized nations.

Land reform: 1919, July: Italian war veterans, spurred by talk by socialists and populists about agricultural reform, began to occupy the farming area in the Lazio and then elsewhere; the government gave the prefects power to expropriate holdings and cede them to the new occupants, 1920, 15 Apr.: 27,252 hectares (half in Lazio) had been redistributed in this manner; 1922 ff.: under the Italian Fascist government no attempt was made to change the landholding pattern, but with agricultural distress large landowners frequently sold or rented part of their holdings to small farmers; 1922-40: in Italy there was a rise in number of independent cultivators, who were loyal to the Fascist regime. 1919 ff.: In Eastern Europe (including Czechoslovakia) there were major agrarian reforms, with some 60 m. acres redistributed, these measures created more small farmers. 1919-28: In Russia, despite efforts, 1919-21, to initiate state farming and despite formal "nationalization," most land remained in peasant hands; 1921: under the New Economic Policy in Russia peasants were allowed to hold their land (though title was vested in the state) and to trade in their own produce. 1927: In the USSR all forms of state and co-operative farming included only 2% of the peasants; the number of small farms had increased (1916, 18 m. farms in Russia; 1928, 25.6 m. farms). The Soviet government thought small farming was inefficient. 1928: The Soviet government undertook a new policy of collectivization; to succeed in the other goals of its 5-year plan; it needed labor released from agriculture

to man new factories, large amounts of food to feed the urban labor force, and exportable surpluses to obtain foreign exchange for industrial machinery. It wanted to put unused land into production, to mechanize farming, and to increase productivity. To obtain these benefits and also for ideological reasons (peasants were conservative and hostile to Communist goals), the Soviet government decided to substitute collective farms (*kolkhozy*) for individual peasant farms. 1928 ff.: Collectivization proceeded by force over the violent opposition of the peasants. 1932: Sharp reduction in area seeded. 1933: Under 2nd Soviet 5-year plan peasants were allowed to farm "garden plots" (allocated to them by the collectives) and to sell freely any surplus. 1938: Collectivization in Russia included 19 m. peasant households and 99.3% of cultivated land. 1940: The USSR had more than 236,000 collective farms (with 371 m. acres) and 4,000 state farms (with 4.7 m. acres).

Mechanization: 1919 ff.: In Canada and Australia extensive mechanization of agriculture occurred. 1928 ff.: Russian government policy sought to increase output through mechanization; tractor plants were built as part of the 1st Russian 5-year plan. The low level of mechanization is evident from the table that follows.

NUMBER OF TRACTORS IN SPECIFIED COUNTRIES
(000)

	1939	1949
USSR	483.5	400.0
Canada	131.5	322.9
Australia	50.0 ^a	76.3
Italy	39.0	39.0
Austria	2.2	10.0
Japan	.1	1.8

^a 1940-41 figures.

Self-sufficiency: 1930's: Government policy in the maturing nations aimed at agricultural self-sufficiency. Most were or became self-sufficient in foodstuffs: Russia (1937), 100%; Italy (1937), 95%; Japan (1930), 80%. Japan—failing to achieve domestic self-sufficiency—sought self-sufficiency within its empire.

RAW MATERIALS. Coal: 1920: Soviet coal production was 27% of its 1913 value; its coal output was only 6.2 m. metric tons; 1930, 50.4 m. metric tons; 1938, Soviet coal production exceeded that of France, and ranked 4th in world industry (following Germany, U.S., and Great Britain).

COAL AND LIGNITE PRODUCTION, 1938
(million metric tons)

USSR	132.9
Japan	53.0
Poland	38.1
Czechoslovakia	30.5
Australia	14.0
Canada	12.9
Italy	2.2

Canada and Italy had inadequate coal for domestic needs and were importers. Japan needed to import certain coking coals.

Oil: Of the newly industrialized countries, only the USSR was self-sufficient in petroleum. 1920: Soviet oil production was 41% of the 1913 value. 1927: USSR resumed its role as the 2nd largest oil producer in the world (USSR surpassed Mexican output to achieve that status.) Soviet oil production (in millions of barrels of 42 U.S. gallons): 1920, 25.4, 1930, 127.4, 1938, 206.2.

Iron ore: USSR and Canada had substantial reserves of iron ore; on the other hand, Italy was an importer of iron ore. Japan had virtually no iron ore, and had to import for its needs.

Other industrial resources: USSR was rich in natural resources of all kinds; Canada too had excellent mineral resources, while Italy and Japan were deficient. Raw silk from Japan—an industrial raw material—continued as an important Japanese export and provided Japan with foreign exchange. 1930's: In the search for self-sufficiency, efforts were made in Italy to develop local resources and also substitutes for certain natural resources. Japan's expansion into Manchuria, 1931, and China, 1937, and then its sweep through Southeast Asia, 1941-42, provided it with basic industrial resources (iron, coal, rubber, and oil).

ENERGY. The energy revolution—the use of electricity and the internal-com-

bustion engine—that had occurred in the mature nations spread to the newer industrial nations. Inanimate sources of energy now did the bulk of the work.

**ENERGY CONSUMPTION PER CAPITA FOR
PRODUCTIVE PURPOSES, SELECTED COUNTRIES,
1937**

(electricity equivalent in kwh for all
energy sources)

	<i>Per Capita Use</i>	<i>Ratio of Inanimate to All Sources</i>
Australia	2,971	91.3
USSR	1,380	88.2
Japan	1,251	91.0

1935: Energy production as a percentage of the world total was, with the exception of the USSR, small compared with the leading industrial nations.

ENERGY PRODUCTION, 1935
(%)

World	100.000
USSR	8.584
Japan	2.963
Canada	1.488

Electric power: The surge of industrialization in the newer countries came to be based from the start primarily on electric rather than steam power. In Canada, Japan, and Italy most of the electric production was from hydroelectric facilities; in the USSR and Australia, the developments were primarily in thermoelectrical plants; 1940: only about 10% of Soviet electrical energy was generated by hydroelectrical stations.

Internal-combustion engine: Applications of the internal-combustion engine to motor-vehicle transport took place along the same lines (but on a smaller scale) as in the mature industrial nations.

Other sources of energy: 1924, Apr.: Establishment in the USSR of a Central Committee for the Study of Rocket Propulsion. 1932: According to Soviet historians, jet-assisted-take-off-type rockets were 1st used in that country. 1935: Successful flight of Russian liquid-propellant meteorological rocket, designed by M. K. Tikhonravov. 1937: The USSR set up rocket test centers—Kazan, Moscow, and Leningrad. 1941, Nov.–Dec.: The Russians used anti-aircraft rockets against German aircraft which were attacking Moscow and also air-to-air rockets on their Stormovik Il-2 fighters. Russian work on rocketry—whether for civilian or military purposes—aided in the development of a powerful propellant to be used in the postwar years.

INDUSTRY. Industrialization occurred in the new industrial nations mainly through the borrowing of techniques developed in the mature industrial nations. 1920's: Canadian industrial progress was significant, following closely the course of U.S. development, U.S. investors in the dominion aided in the growth of the

latter's industry. Yet Canadian manufacturing continued to represent only a small portion of world manufacturing. 1930's: With the depression, there was a slowdown in the development of manufacturing in Canada. 1920–40: Italian, Japanese, Soviet, and Australian manufacturing output rose more rapidly than the world average, only Soviet manufacturing, however, came to provide a substantial percentage of *world* manufacturing. 1938: USSR was 2nd only to the U.S. in world manufacturing.

Textiles: Among all the newly industrialized nations, only in Japan did the textile industry act as the leading sector. The Japanese textile industry became increasingly efficient (1920, 91 workers per 100 looms in Japan; 1931, 36 workers per 100 looms); 1927–32: the technical revolution in the Japanese cotton industry gave that nation the opportunity to move into foreign markets formerly served by British goods. 1930's: Japan introduced more precision machinery, improved the quality of its cotton goods, and reduced prices. Although its textile industry became increasingly capital-intensive, wage levels remained low. Japan had the lowest cost cotton textile production in the world.

Utilizing steel, engineering industries developed especially in the USSR and Japan. 1930's: Growth of Japanese and Soviet armaments industries. Automobiles and tractors: 1919: Japanese army authorities ordered trucks from existing private factories; 1919-31: most motor vehicles in Japan were imported; 1931: Japan started to develop an indigenous motor-vehicle industry.

1932	840
1933	1,612
1934	2,701
1935	5,355
1936	9,632

1923, 4 Mar.: Soviet decree formally established a domestic tractor industry. 1928: 5-year plan endorsed expansion of tractor output. 1930, June: Stalingrad tractor factory opened, the 1st Russian large-scale tractor plant. 1932, Jan.: USSR began to produce the 1st all-Russian-made cars and trucks at a plant in Nizhni Novgorod. 1944: Australia made the commitment to full manufacture of automobiles (not only building the bodies); the Australian government invited foreign automobile makers to submit proposals, which they did.

Other industries: 1920's: Increase in industries processing raw materials (paper and pulp in Canada, especially). 1920-40: Electrical and chemical industries grew. 1930-45: In the USSR, Japan, Italy, Canada, and Australia new aircraft industries began. Petroleum refining became

an important industry in USSR and Canada (the latter based mainly on imported oil). 1920's: In Italy, the state-owned Azienda Generale Italiana Petroli (AGIP), established in 1926, started to build refineries in that country; American cos. also built refineries in Italy. Although Australia had several oil refineries, they were concerned almost entirely with by-products and accounted for only a small fraction of Australian requirements; all automobile and aviation gasoline used in Australia was refined abroad. 1938-48: The war stimulated industrial activity in some cases and destroyed it in others.

TRANSPORTATION. 1920: For practically all the new industrial countries railroad development had been completed; the USSR was the exception. 1920-40: Railroad lines in the Soviet Union increased from 36,600 to 62,500 mi. Automobiles became the main means of transportation in Canada. 1920's: Total private automobiles in use in Canada numbered 2nd only to those in U.S.: 1930's: private automobiles in use in Canada numbered 3rd, after the U.S. and Britain.

PRIVATE AUTOMOBILES IN USE
(000)

	Canada	Italy	Japan	Russia

1926	736	105	28	8
1930	1,047	183	56	10
1935	990	244	83	44
1938	1,160	289	59 ^a	85

^a The decline was due to the Japanese government's policy of not granting foreign exchange for imports of private automobiles.

In Japan available transportation ranged from the primitive to the sophisticated.

**BICYCLES, CARTS, AND MOTOR VEHICLES
(INCLUDING TRUCKS) REGISTERED IN JAPAN,
1937**

Bicycles	7,878,463
Carts for goods, human or animal drawn (excl. horsecarts and oxcarts)	1,519,334
Horsecarts	307,889
Oxcarts	111,146
Motor vehicles (incl. trucks)	128,735
Rickshas	15,376

With the growth of automobile travel came improvements of the roads in all these countries, especially Canada and Italy. Travel by air increased. 1937, 15 July: 3 Russian flyers made a world-distance nonstop record, flying over the North Pole from Moscow to San Jacinto, Calif., in 62 hours. 1941, Aug.: An Italian Caproni-Campini jet-propelled plane, having a conventional engine with ducted fan, was produced and test-flown in Italy; 30 Nov.: Italian jet-propelled Caproni-Campini airplane flew 275 miles from Turin to Rome.

FINANCE. Capital: 1919-39: In the drive to maturity, the new industrial nations generally financed their economic growth out of locally available funds; this was true in the USSR, Italy, and Japan; it was not in large part true in Canada and only partly true in Australia. USSR, because of its refusal to honor previous debts, got virtually no capital from abroad. Italian economic growth was out of reinvested earnings rather than foreign capital. Japan too financed its own development in the main with a high rate of savings and investment. Canada, by contrast, depended on U.S. and to a smaller extent British capital; Australia got considerable capital from Britain.

Banking reform: 1919: In the USSR banking was in disarray following the Revolution, 1917, when it had been nationalized. 1921, 16 Nov.: New Russian state bank (the Gosbank) established. 1919-20: Boom in Japanese banking; 1920-21: failure of a number of Japanese banks; 1923: Kwanto earthquake in Japan meant new calls on banking facilities; moratorium declared as an emergency measure; 1927: Watanabe Bank failed, the Akaji Bank followed,

and a run occurred on Japanese banks; this major banking crisis had come in the wake of the construction boom after the earthquake. 1928, 1 Jan.: as a result of the 1927 crisis, a new Banking Law in Japan provided that all ordinary banks must have capital of more than 1 m. yen (banks in Tokyo and Osaka were required to have capital of more than 2 m. yen, while banks in towns and villages with populations under 10,000 were allowed a minimum capital of 1.2 m. yen); the new Banking Law prompted many bank mergers. 1926, 6 May: When the right of issue was finally confined to the Bank of Italy, Italy at last had a central banking system; 1936, 12 Mar.: in a major reform of the Italian banking system, the Bank of Italy was transformed into a public institution. 1934: Canada established its 1st central bank; the Royal Bank of Canada opened, 11 Mar., 1935.

Stock exchanges: After the Bolshevik Revolution, Russian stock exchanges were closed. 1922, 2 Jan.: Re-establishment in Moscow of a Central Commodity Exchange with a stock-exchange section. 1930: Abolition in the USSR of both the commodity and stock exchange; the spread of government ownership and centralized allocation of capital in the USSR made the use of stock exchanges irrelevant.

Effects of international financial conditions: Unlike the mature industrial countries, the new industrial nations were less active as principals in international financial transactions. The events that stemmed from the establishment of German reparations and German inability to pay, however, ultimately had important worldwide ramifications. While Japan's domestic financial crisis of 1927 anticipated the world crisis, her financial recovery was once more jarred by world conditions, 1929-33. Although there were no bank failures in Canada, Canada felt the world financial crisis in a severe manner, with economic stagnation as a consequence. The Soviet Union, seeking to end her isolation from the world economy, found the curtailment of credit worldwide, affecting her economy. 1929-33: The world crisis left no nation ex-

empt. 1931, 2 Dec.: Japan went off the gold standard. 1934, 26 May.: The Italian government imposed strict control over foreign exchange, and controls continued through World War II. 1936 ff.: Japanese controls on foreign exchange became more extensive.

FOREIGN TRADE. 1920's: Japan depended on imports of essential raw materials and on exports to obtain foreign exchange to import for its needs; textiles continued as the main Japanese export. Italy required imports of iron and oil—basic raw materials; initially, Mussolini's government, 1922 ff., sought to stimulate foreign trade through commercial treaties (1922, 13 Nov.: Italian-French treaty, 1923, 28 Apr.: Italian-Austrian treaty; 1925, 31 Oct.: Italian-German treaty); 1925 ff.: Italy's policy became more nationalist. After the Bolshevik Revolution, Russian foreign trade dropped sharply; 1921 ff.: the Soviet Union sought to re-enter international trade, with only minor success. 1920's: Wheat was the basic Canadian export. 1929, Aug. ff.: Wheat prices in Liverpool began to fall sharply; Canada had giant grain surpluses which pushed down prices; there were excellent harvests in Europe; USSR began to export wheat, 1930: Australia had a record wheat crop (214 m. bushels)*; to add to the depressing influences, European nations erected high tariff barriers, closing off markets to Canadian, Russian, and Australian wheat. The Canadian and Australian economies suffered, as the result of falling export prices. 1931–32: Australian wheat exports were 80% greater in volume than before the depression; butter exports more than doubled; mutton increased nearly 2½-fold; sugar twice over; beef by ⅓, flour by ¼, and wool by ⅓; nonetheless, with the low prices, in value Australian exports were 55% of their 1928–29 value. 1929, Apr.: Export price per 100 *kin* of Japanese silk was 1,420 yen; 1932, June: export price for the same quantity of silk was 390 yen. 1929–33: Italy, Canada, Australia, and Japan followed the international pattern of raising tariffs and imposing restraints on imports. 1932, 21 July–20 Aug.: Ottawa Conference was

convened with the goal of reviving trade within the British Empire; the British offered dominion products preferential treatment; such products were guaranteed free entry into Britain for 5 years (except for certain exempted items on which a duty might be applied after 3 years); Britain imposed or raised its duties on foreign goods. In return, the dominions lowered their tariffs on British imports. 1932 ff.: These arrangements notwithstanding, Canadian trade stagnated. Australia lowered its duties in accord with the Ottawa Agreements, but because of imperial preference the Commonwealth became involved in trade disputes with other countries. 1933 ff.: Australia negotiated commercial treaties with Belgium, France, and Czechoslovakia. 1936, May: Australian government adopted the policy of "trade diversion," consisting of discriminatory duties, quotas, and import licenses directed against the U.S. and Japan; the U.S. was subjected to discrimination because it sold far more in Australia than it bought there; the Australians discriminated against the Japanese to protect British trade (Japanese products in Australia competed against British goods); Japan, as a result, stopped buying Australia's major export, wool, which hurt the Australian economy. 1936, Dec.: Australian-Japanese agreement. Japan, however, continued to purchase less from Australia than in the 1920's. 1930's: Australian commerce recovered very slowly from its depression lows. 1930s: In Italy self-sufficiency became the cornerstone of government commercial policy; 1935, 7 Jan.: Count Paolo Taon di Revel, Italian minister of finance, terminated completely the system of multilateral trade and payments negotiations; he imposed added restrictions on trade and foreign exchange transactions; Italy encouraged bilateral agreements and barter plans. 1935: League of Nations declared economic sanctions against Italy after that nation's invasion of Ethiopia (9 Oct., 1935: sanctions declared, to be imposed 18 Nov.); the League urged all countries (1) to end exports of arms and war matériel to Italy; (2) to refuse credit to the Italian government, public agencies,

businesses, and private persons in Italian territories; (3) to stop importing Italian goods; and (4) to discontinue exporting raw materials required for Italy's war industries. 1935, 9 Oct.-18 Nov.: Italy bought everything it could before the sanctions went into effect; 18 Nov. ff.: many nations (including U.S., Germany, and Japan) did not follow the League's proscriptions; Italy was able to import sufficient goods. 1936, 15 May: The League's sanctions against Italy ceased, they had been a total failure. Yet Italy continued to pursue a policy of self-sufficiency. 1933: Yardage of Japanese cloth exports exceeded that of Britain for the 1st time. Tariff barriers abroad rose against "cheap" Japanese exports. 1934: Japanese Trade Protection Law gave the government power to retaliate against discrimination against its goods, Japan increasingly turned to "empire self-sufficiency." 1930's: National and empire "self-sufficiency" became common goals. "Bloc trading," such as that within the British Commonwealth and in the Japanese Empire, assumed increasing importance.

Soviet participation in world trade remained low; because of the USSR's continued failure to honor its prewar debts, it was not considered a reliable trading partner. USSR achieved virtual self-sufficiency. 1939 ff.: Canadian exports and imports rose as Canada filled wartime needs; with many imports cut off, Australia moved into more manufacturing. 1911, Dec. ff.: Japanese trade with the allied countries ceased entirely and was confined during the war years to areas under Japanese control 1943: Under lend-lease Americans made large shipments to Russia for the latter's defense; the USSR's imports rose sixfold over their 1936-40 level, her exports fell by 1/4.

FOREIGN INVESTMENT. USSR had renounced her foreign obligations. 1920's: While a few foreign investments were made in the USSR, most foreign investors hesitated. 1928 ff.: USSR stopped trying to encourage foreign investors. There were no important Soviet investments abroad. Japan and Italy were creditors in international accounts, while Canada and Australia were debtors.

FOREIGN INVESTMENT POSITION, 1938
(\$ million)

	Credits (Foreign Investments Abroad)	Debts (Foreign Investments Within Nation)
Japan	1,290	534
Italy	424	176
Canada	1,855	6,628
Australia	254	3,730

1939-45: Following the war and military defeat, Japan and Italy lost almost all their foreign assets; Canada and Australia continued to be debtors on international accounts.

BUSINESS ORGANIZATION. Canadian and Australian business organizations in all but size bore a clear resemblance to those developed in the U.S. 1928 ff.: In the USSR government participation in business meant an attempt to substitute a "command" economy for one regulated by the market; government-owned business enterprises allocated resources to correspond with prescribed needs (prescribed by the government) rather than market demands;

profit in Russia was not the measure of business performance—as in other contemporary industrial nations. In Japan the *zaibatsu* form of business organization assumed greater importance; 1931: Major Industries Control Law and Industrial Association Law in Japan legalized the existence of cartels, 1930's: the leading giant *zaibatsu* continued to be Mitsui, Mitsubishi, Sumitomo, and Yasuda; other large *zaibatsu* existed; in addition, private Japanese corporations developed outside the *zaibatsu* structure. Also present in Japan were literally thousands of small businesses (of the type prevalent in a backward economy). 1922 ff.: Mussolini's plans for a corporate state in Italy took

shape; private businesses were expected to co-ordinate their plans with national goals; yet within the context of the corporate state, private enterprise was given a large measure of freedom. The Italian government encouraged cartelization. 1930's: Increasingly the Italian government became directly involved in industrial enterprises. There do not seem to be any valid generalizations on the path of the newly industrialized nations and forms of business organization; prevailing government attitudes toward competition ranged from acceptance of competition as desirable (in Canada and Australia) to rejection of it as inefficient (in the USSR, Japan, and Italy). The rejection of competition was most complete in the Soviet Union; in Japan, despite government encouragement of cartelization, there seems to have been considerable competitive activity on the part of private businesses; in Italy harmonization took priority over competition.

GOVERNMENT POLICY. 1920-40:

As a whole, these decades saw increased government intervention in every industrial nation; there were (1) aid to agriculture, (2) participation in building transportation facilities, (3) aid to and in some instances direct involvement in industry, and (4) in some nations new planning and control.

Aid to agriculture: 1925, 20 June: Mussolini called for higher Italian grain output and urged agricultural self-sufficiency; 1925 ff.: Italian farmers got tariff protection, artificially high prices, and other government assistance; the Fascist state undertook land reclamation and improvement; 1926, 30 Dec.: Italian government aid went to farmers' co-operatives (purchasing, processing, and marketing units); 1927, 29 July: law passed in Italy creating the National Consortium of Agrarian Credit for Improvements, providing loans to farmers. 1936: After the Ethiopian War, the Italian government renewed its efforts toward developing agricultural self-sufficiency; under government sponsorship new crops were introduced. 1928: With government encouragement, Canadian wheat pools held back part of their crop, seeking to avoid price declines.

1930, Nov.: Canadian federal government provided substantial aid to the wheat pools. 1930's: The Japanese government used its funds to attempt stabilization of rice and silk prices, to readjust farm debts, to provide relief to indigent tenant farmers, to control fertilizer prices, and to encourage emigration to Manchukuo. 1931-35: The Australian government subsidized wheat farmers to the extent of £12.5 million; state governments in Australia canceled debts of many wheat growers; 1934: the Australian government imposed high domestic prices on wheat to aid the farmer; the proceeds of a tax on flour were distributed among the wheat growers; similar government support went to the dairying and sugar industries in the Commonwealth.

Transportation: Participation in highway and railroad construction became a common function of all governments. 1920: Formation of Canadian National Railroads, which put the transcontinental railroads in Canada (except for the Canadian Pacific Railway) in government hands; nationalization was not based on principle, but rather to maintain operations on railroads that were not profitable to private investors. 1928: Establishment in Italy of the Autonomous State Agency for Roads, which undertook a large-scale program of building *autostrade* and improving existing roadways. The Japanese railroads and roadways were government-built.

Government aid to and participation in industry: Tariffs and restrictions against imports aided industry; likewise, governments sought to encourage exports. 1919 ff.: Japanese government extended protectionist tariffs to key industries, iron and steel, machinery, and chemical; it encouraged citizens to "buy Japanese." 1931 ff.: Japanese government policy of armament and industrial development went forward with dramatic results. Key officials in the *zaibatsu* took on important roles in shaping government economic policy; the government thus was sympathetic to industry's needs. 1934: Yawata Ironworks (the government-owned iron and steel co.) merged with 6 *zaibatsu* firms to form the Japan Iron Manufactur-

ing Co. (the Japanese government owned 78% of the authorized capital of this firm—the largest iron and steel producer in Japan). 1937 ff.: After the start of the Sino-Japanese War, the Japanese government undertook extensive direct investment in Japanese business. "National Policy Cos." were formed, owned by the government to expand production for war needs. The Australian government had participated in munitions production during World War I; after the war, some plants were retained by the government, these produced consumer goods until the outbreak of World War II, when they were reconverted into armament facilities. The Australian government, which owned railroads, also manufactured equipment for the railroads; it participated with British oil cos. in joint ventures, refining certain oil products. The Australian government also took part directly in aircraft production and shipbuilding. The Italian government gave aid to industry when it was required. 1933, 23 Jan.: Formation in Italy of the *Istituto per la Ricostruzione Industriale* (IRI), with capital provided by the state and by the sale of its own bonds, the new IRI was to aid banks and faltering industries. IRI made direct investments in a number of enterprises, providing financing and management; 1936: IRI took over the Italian Line, Lloyd Triestino, Adriatica, and Tirrenia and established, as a shipping subsidiary, Finmare; 1937: IRI created Finsider, a subsidiary, which had holdings in the metallurgical trades, including Italy's major steelworks; IRI also became involved in shipbuilding, machine industries, and munition manufacturing. 1933-41: IRI's net expenditures were 4 billion lire; through its activities what had started as government aid became extensive direct government involvement in industry. This supplemented the Italian government's participation in the petroleum industry and its general controls.

Government planning and control:

The most extensive government involvement was in the Soviet Union. 1918-21: Period of "War Communism": the Soviet government attempted to nationalize the

means of production and also the service industries; it sought to nationalize land. 1921-28: New Economic Policy (NEP) in the USSR marked a sharp change in policy; about 40% of Russian business was returned to private ownership and operation (this involved mainly enterprises in light industry and trade); peasants were allowed to till their own land (although technically the land belonged to the state); foreign concessionnaires were invited to invest in USSR. Basic industry and utilities remained nationalized. 1928, 1 Oct.: The 1st 5-Year Plan of the Soviet Union was announced, providing for heavy industry, increased coal and oil production, greater electrical energy output, and automobile, tractor, and machining plants. The plan offered the basis for an industrialized Russia. Renewed emphasis was placed on nationalization of all industry. Foreign technical aid was called in, but foreign capital was not. The 5-Year Plan endorsed collectivization of the land. 1933: By this time all private ownership of Soviet industrial production had ended; with the exception of collective farms and some co-operatives (mainly in retailing), state ownership had become general. 1933: 2nd 5-Year Plan introduced; it stressed the growth of transportation; initially it put emphasis on enlarged consumption. 1933-35: Output of consumer goods increased, so that severe shortages, which occurred under the 1st 5-Year Plan, were in part eliminated. 1936: Emphasis of 2nd 5-Year Plan shifted attention primarily to heavy industry; production for defense began. 1938: USSR inaugurated 3rd 5-Year Plan, concerned mainly with providing for the possibility of war. Italy: 1922-25: "Liberal phase" of Italian Fascist economic policy began: Mussolini, 1922, returned to private ownership all government-owned utilities, reopened to private underwriters the field of life insurance (which had been nationalized in 1912), issued decrees seeking to attract foreign capital, and eliminated government subsidies to co-operatives; tariffs were moderate; Mussolini's plans for a corporate state began to take shape; the goal was to organize employers and

employees into syndicates or "corporations" that would act in harmony in the interest of the total national welfare. 1923, 20 Dec.: Mussolini named a permanent commission of 5 worker and 5 employer representatives to study means of improving relationships between business and labor. 1926, 3 Apr.: Rocco Law on Corporations (written by Alfredo Rocco, minister of justice) was the capstone of the "corporate state"; it created means for the government to use in handling disagreements between employers and workers. The law authorized the establishment of 13 syndicates (6 each for employers and employees plus 1 for professionals and intellectuals); employees had a general confederation and a similar general confederation was projected for employers (the latter never came into existence); at the top of the pyramid was the Ministry of Corporations, which controlled the entire system; the system sought to encourage private initiative; state intervention was to occur only when private enterprise could not act efficiently or when there were political considerations involved. Government intervention could be in the form of aid, regulation, ownership, and control. 1933 ff.: Major increase in Italian government's role. 1934, 4 Feb.: Reform of the Italian corporate state's structure occurred, substituting 9 syndicates for the original 13; the reform introduced 22 new corporations composed of leaders in the 9 syndicates, technicians, workers, co-operatives, and Fascist Party. Members of the 22 corporations formed the National Council of Corporations. 1939, 19 Jan.: Italian Chamber of Deputies replaced by a Chamber of Fasces and Corporations, made up of members of the National Council of Corporations, representatives of the Fascist Party, and the Grand Council of Fascism. The extensive government planning and control in the USSR and the novel role of the government in Italy put these states in a unique peacetime economic position. The Japanese government, in its attempt to build up armaments, did not perhaps take radical de-

partures, although its role was clearly one of increased national involvement. By contrast, the Canadian government sought to promote economic development by maintaining classical competitive enterprises. 1919: Combines and Fair Prices Act and the Board of Commerce Act passed in Canada to cope with post-war profiteering (1921: Privy Council disallowed these measures). 1923: Canadian Combines Investigation Act passed, which became Canada's basic antitrust measure. 1923 ff.: Canada continued to see the role of government as favoring competition rather than co-operation among business enterprises. 1938 ff.: In every newly industrialized nation, as the threat of war grew, government regulation and control became the norm. New government agencies were formed to direct the various economies toward war production. Planning and control came to be linked with national defense and victory.

MEASURES OF ECONOMIC GROWTH. The indexes of manufacturing output indicate that with the exception of Canada (which felt the depression years most severely) the USSR, Italy, Japan, and Australia all grew faster during the interwar years than the world average.

NONMONETARY INDICATORS OF RELATIVE
NATIONAL CONSUMPTION LEVELS, 1934-38

	<i>Relative Data (U.S. = 100)</i>
Canada	80.6
Australia	80.0
Czechoslovakia	47.0
Japan	40.0
Italy	39.6
USSR	33.6

SOURCE: M. K. Bennett, "International Disparities in Consumption Levels," *American Economic Review*, Sept. 1951, p. 648.

Economic Change in the Less Developed World

During 1919-45 much of the less developed world remained unchanged. There were still the Bedouins, who moved with their camels and horses over vast territories. Masai cattle breeders in East Africa still wandered over long distances to obtain fresh pasturage. Mongol and Turkish cattle-breeding tribes in Central Asia held to established patterns of migration, returning regularly to the same regions. Change in the lives of most nomads was nonexistent. Yet in some cases change did occur. 1920's: the Siberian reindeer nomads began to adopt a more settled pastoral life. King ibn Saud in Saudi Arabia took preliminary steps to develop agricultural communities and to transform Bedouins into farmers. In Outer Mongolia some nomads began to settle.

AGRICULTURE. For most of the world agricultural conditions—subsistence farming, commercial (domestic and export) farming, and plantation agriculture (for export)—persisted in much the same fashion as in 1870-1919. Typically, a less developed country had more than 50% of its population involved in agriculture, although there were exceptions. 1920-45: Changes in agriculture included spreading use of the plow in agriculture (especially in Africa), increasing monetization of economies (through greater commercialization of agriculture practically everywhere and through more demand for male labor where there were plantations), new lands under cultivation, and some new plantations (but the peak years of starting fresh enterprises, 1870-1919, were past). Efficient plantation agriculture in rubber, quinine, tea (for example) eclipsed indigenous agriculture; 1920's: expansion of rubber plantation economy in Malaya and the Netherlands East Indies. Except for foreign-owned plantations, everywhere agriculture remained undercapitalized. Mechanization (except

on foreign-owned plantations) proceeded slowly.

Agrarian reform: 1919 fl.: 12 Eastern European nations undertook agrarian reform. 1924 fl.: In Turkey a gradual process of land redistribution began; peasants were given tax relief and encouraged to raise output. In Latin America, where large landed estates, inefficiently farmed, retarded economic progress, land reform began 1917-34: In Mexico 20 m. acres were returned by the government to Indian villagers and to mestizos; nonetheless, large landholdings persisted. 1934-40: Under the administration of Lázaro Cárdenas in Mexico, millions more acres were redistributed and there

^a Often includes woodlands or wasteland.

^b By 1937 about 6.5 million additional acres had been redistributed among some 700,000 purchasers.

was a breakup of the largest landed estates. 1915: By this time the Mexican government had redistributed 76 m acres to 1.7 m. individuals; land had been given to agrarian communities known as *ejidos*, to the extent of 3 m. acres. Mexican land reform was the most dramatic in Latin America. 1921: Tenancy reform legislation in Argentina sought to protect the tenant by requiring contracts of not less than 5 years' duration and by recognizing certain tenant rights, the legislation was, however, ignored by the large landlords. 1930's: Laws were passed in Argentina, seeking to tax large landowners and aid small farmers; but the legislation was evaded. The Argentine land reforms had no important effects. In much of Asia small peasant plots grew smaller as population increased. Attempts were made in India to consolidate "postage stamp" plots, with little success. 1939: 75% of the landholders in India held less than 10 acres; in many sections of India average farm size was less than an acre. 1929-33: A survey of about 17,000 farms in China in 22 provinces discovered 80% averaged less than 7.17 acres. 1930:

Land Law in China gave the Land Bureau power to take steps for the consolidation of scattered plots into single holdings; success in this effort was minimal. In China, there was no reform of tenancy relations and, at the same time as fragmentation in ownership existed, there were also large absentee landowners. Inequity in land distribution was evident. 1930's: In Tongking (Indochina) 62% of all farm families had less than .9 acres in rice fields (the major crop), while in Annam 69% of the peasants cultivated less than 1.2 acres in rice; little was done to cope with this situation. Egypt had a similar problem, with 70.7% of all farms under an acre in size; on the other hand, Egypt also had huge landholdings. 1938: The average cocoa farm in the Gold Coast was 2½ acres. Land reform in colonial empires continued to involve clarification of land-tenure relations and the introduction of concepts of private property.

Agricultural progress: 1920-45: The perpetuation in many countries of existing agricultural conditions (or the worsening of agricultural conditions with

land fragmentation), plus the low level of agricultural technology, did not aid agricultural productivity and served to retard the process of industrialization. One exception was Turkey, where, based mainly on the increase in agricultural output, per capita income rose by over 50% between 1924 and 1938.

RAW MATERIALS. **Coal:** On the whole, less developed nations were not large producers of coal. 1938: In all South America only 3.3 m. metric tons of coal were produced, while in all Africa (excluding South Africa and Southern Rhodesia) only .5 m. metric tons of coal were mined. In the less developed world, only Poland, India, China, and Union of South Africa developed their coal output so it exceeded that of Australia or Canada. They were exceptional and compared with the leading industrial nations their coal output was low.

Southern Rhodesia	1.0
Mexico	.9

^a Estimate for 1936.

Oil: 1919-40: The major interwar development in the less developed countries was in petroleum. Oil development was by foreign capital. 1919: The largest oil producers were the U.S., Mexico, USSR, and the Netherlands East Indies (in that order); oil production was just starting in Venezuela; the only Middle Eastern countries producing oil were Iran and Egypt. 1940: The largest oil producers were the U.S., USSR, Venezuela, Iran, Netherlands East Indies (in that order); in the interim, key events in the oil industry were: 1927, Oct.: large Kirkuk oil field discovered in northern Iraq. 1932, 1 June: Oil discovered in Bahrain. 1938: Oil discovered in commercial quantities in Saudi Arabia; oil discovered in Kuwait. 1938, 18 Mar.: Mexican government nationalized its oil industry.

Iron ore: In China, India, French Indochina, Brazil, Chile, Union of South Africa, and North Africa, iron-ore mining developed.

Copper: 1930's: In Chile copper replaced nitrates as the nation's major export. Northern Rhodesian mines came into production; output of copper mines in the Belgian Congo rose. The U.S. remained the world's largest producer of copper.

Tin: Tin came almost exclusively from less developed countries, and the world's

largest tin producers were Malaya, Netherlands East Indies, Bolivia, Thailand, China, and Nigeria. World War II resulted in changes of patterns of control over raw materials. The Japanese invasion of Southeast Asia meant that industrial raw materials such as rubber and tin, and to a lesser extent oil, were under Japan's control.

Synthetics: 1919-45: While less developed countries produced increased quantities of industrial raw materials, a challenge to raw-material industries came in the form of synthetics; the develop-

ment of synthetic nitrates put the prosperous Chilean nitrate industry into the doldrums; synthetic rubber presented a potential challenge to natural rubber, synthetic fibers began to offer competition to other industrial raw materials.

ENERGY. In less developed countries, use of electrical power and the internal-combustion engine rose, especially in Latin America. The use of human beings and animals as sources of energy, however, remained common in Asia and Africa.

The less developed countries accounted for only small portions of the world's total energy production.

INDUSTRY. The spread of industry to less developed nations was most pronounced in Latin America and Asia (especially India and China); manufacturing in Africa (except for South Africa) remained rudimentary (and mainly of a household sort). 1920-45: In South Africa, substantial development of manufacturing industries. 1920's: In the

Netherlands East Indies attempts made to establish large-scale manufacturing enterprises failed because of the absence of local markets. 1930's: In India, China, and a number of Latin American countries modern industries were established; in the Netherlands East Indies, develop-

ment of small-scale industry in rural regions; in French Indochina, new industries were established on a small scale, of a native handicraft type. Measures of growth of manufacturing in less developed countries are few.

Textiles: 1920-40: Indian factory-made cotton cloth replaced imports. 1920 ff.:

China's machine-made yarn replaced imports; 1925: China was no longer a net importer of yarn (1937: China had roughly 5 m. spindles, about half of them in foreign-owned—mainly Japanese mills). 1920-40: Modern power looms began to replace handlooms in China; 1937: China's 60,000 power looms were also mainly in Japanese mills; 80% of China's cloth was still woven on handlooms. 1920 ff. Brazilian cotton textiles became a well-developed factory industry; in Argentina, new textile factories—on a large scale—began.

Iron and steel: 1921: Establishment of Brazil's 1st integrated iron and steel operation, with charcoal blast furnaces, by the Belgo-Mineira Co. (a Luxembourg steel combine). 1911: construction started on the National Steel Co. (Companhia Siderurgica Nacional) works at Volta Redonda (production began 1946)—the true start of Brazil as a steel-producing nation. 1920-10: Expansion of existing iron and steel facilities in India and Mexico. 1934: Establishment in Pretoria, South Africa, of a fully integrated iron and steel industry. 1941: Incorporation of Cia. de Acero del Pacifico, S.A., in Chile, and the start of construction on what would become a large-scale fully inte-

UN figures (except China); Chinese figures are from *Mineral Industry*, they are in gross tons. Turkish figures are for 1940.

Other industries: 1920-45: India developed certain metal products and chemical industries. India's sugar-refining, papermaking, soap, match, cement, rubber, and leather-goods industries developed. In China, factory-made paper, matches, and pottery replaced village industries; 1930's: the main Chinese industrialization took place in Manchuria, which was (from 1931) under Japanese control. 1937: Japan invaded China proper; the effects on industry were twofold: (1) the destruction of industrial equipment, but (2) the rebuilding of industry to meet Japanese requirements. 1920's and 1930's: British firms developed business enterprise in Hong Kong—sugar refining and cement, as well as textiles. 1937: After the Japanese invasion of China, industrialization of Hong Kong (still under British sovereignty) accelerated. 1920's: In Malaya, where there was prosperity based upon rubber and tin, rubber-tire industries and automobile assem-

bly began (based on foreign investment). 1920's. In South Africa, automobile assembly began, 1921, processing of locally produced foodstuffs (flour, cheese, preserved fruit, and sugar) developed as a substantial industry, diamond-cutting workshops were established (1927 for the 1st time); other industries from the making of gasoline pumps to nails and shovels started in South Africa. 1934 ff. As the South African steel industry developed, metalworking industries expanded, involving engineering industries (including machinery) as well as consumer goods. 1920's: In Brazil, automobile assembly began. 1920; electrical-appliance, cement, and corn-products industries took form. 1930's: In Brazil a variety of new chemical, metal products, and foodstuffs industries started. In Argentina and Mexico similar industries made headway. In many less developed countries factory industries were often confined to textiles, paper, soap, and breweries. In much of Africa even these basic factory industries did not exist. Facilities for manufacturing automobiles, tractors, trucks, or aircraft existed in none of the less developed countries. In none of the petroleum consuming countries in Asia or Africa was there a petroleum refining industry; where petroleum production existed, however, refineries were built, generally by foreign capital, and in some Latin American countries refineries existed running on imported crude oil. 1938-45: World War II stimulated industrialization in Latin America, especially Argentina and Brazil. It also spurred manufacturing in South Africa. In China, after the Japanese invasion, industrial production showed marked annual variations (see table p. 789).

TRANSPORTATION. In most less developed countries, railroad construction continued. Most railroads were built in

1910 figures; 1920 figures not available.

order to carry primary commodities to port cities for export; they did not develop national markets. India with its substantial railroad network still used bullock carts to a large extent for internal

transit. 1919: In China most of the major cities were connected by rail; this should have aided development. 1920's: The political chaos in China was not conducive to more railroad building and operations of the existing system were curtailed. 1929 ff.: Chinese government's plans to extend the railroads came to little. 1938: Completion of 865-mi. Trans-Iranian Railway from the Persian Gulf to the Caspian Sea, built with native capital, a major construction feat, designed with national interests in mind rather than as a link with foreign railroads (as had been the case with most Middle Eastern lines). Despite the extension of railroad lines, rail transport remained inadequate in most less developed countries. Nonetheless, railroads did compete with traditional methods of transport, substituting for, in some cases, and supplementing, in other cases, water, animal, and human carriers. Likewise, highways were constructed in less developed countries. 1919 ff.: Highways were built in Iran, Iraq, Turkey, Syria, Egypt, and Arabia; many followed the ancient pilgrim and caravan routes, automobile and truck traffic along the roads increasingly replaced camel caravans. In Africa highways were often built as links connecting with the railroads. Many African roads were built to improve the utilization of human portage. 1920's and 1930's:

Trucks and cars began to travel African roads; railroad and truck transport (in that order) were far cheaper than the use of humans; 1923: 1st steps taken to build a Pan-American Highway. Late 1920's and 1930's: Provisions for air travel (airline routes, airports, etc.) were introduced into less developed countries, air travel, however, was mainly by foreigners or the select few within these countries. Despite the introduction of modern transportation facilities throughout much of the less developed world, traditional modes of transport persisted as they had for hundreds of years. Yet the basis for a transportation revolution had been set.

FINANCE. All underdeveloped countries were short of capital. They depended to a large extent on foreign investment. Banking facilities were inadequate in most countries. In most less developed lands, foreign banks continued to finance foreign trade and deal in foreign exchange. The major innovation in banking in the less developed countries in the 1920's and 1930's was the spread of central banking institutions. 1920's: In China about 100 local banks (private, provincial, and national) issued large amounts of bank notes, the value of which depreciated rapidly. 1924: Establishment of the Central Bank of China in Canton; 1928: this bank was reorganized and relocated in Shanghai; it was to act as a central bank of issue and a government treasury. China sought to create domestic banks to compete with foreign banks in dealing with foreign exchange (the Bank of China), to aid internal improvements and industry (the Bank of Communications), and to assist the farmer (the Farmers' Bank of China). The 4 major banks—the Central Bank of China, the Bank of China, the Bank of Communications, and the Farmers' Bank of China—all issued notes, and their functions, theoretically distinct, were not so in practice. 1935, Nov.: China nationalized the old silver currency and substituted a uniform paper currency; the notes of the 4 key banks replaced silver and other notes. 1921: The 3 Presidency Banks in India were merged, and the Imperial

Bank of India, a central bank, was created to handle the general banking business of the government of India. 1934: Reserve Bank Act and Imperial Bank of India (Amendment) Act were passed in India; under these measures a central reserve bank (a new central bank) was established and the Imperial Bank of India no longer acted as the government bank; the new Central Bank (which began to function Apr. 1935) controlled credit and currency, regulated exchange, and handled the government's banking business. 1919 ft.: 1st Arab, Egyptian, and Turkish commercial banks established; they were small compared with the European banks operating in these countries. 1920's and 1930's: Establishment in Latin America of added banking facilities, and also of central banks (for example, 1923, 11 July: Banco de La Republica, established in Colombia as a central bank; 1925, 21 Aug.: Banco de Chile established in Chile as a central bank; Sept.: Banco de Mexico, S.A., established as a central bank; 1939, 8 Sept.: Banco Central de Venezuela, S.A., incorporated). 1934, 24 Apr.: Nacional Financiera formed in Mexico to provide a market for Mexican government bonds; 1941: it was reorganized to aid in financing industrial expansion. Stock exchanges in less developed countries were in their infancy. 1933: Formal organization of Mexico City Stock Exchange. By 1939 there were organized stock exchanges in Rio, São Paulo, Porto Alegre (government bonds only), Recife, Santos, and Vitoria, Brazil. Stock exchanges existed in other Latin American cities. 1927: Manila Stock Exchange organized.

FOREIGN TRADE. To the extent that less developed countries were involved in world trade, they felt market fluctuations more severely than the industrial nations. 1921: Sharp temporary drop in prices of primary products, but full recovery did not take place. 1920's: Because populations of industrial countries were growing more slowly, demands for primary goods also rose slowly. Prices on primary products showed weakness. Attempts were made to stabilize prices. 1922, 1 Nov.: The British rubber restriction scheme, the Stevenson Plan, sought

to curtail output of the rubber plantations in Malaya and Ceylon with an eye to raising the world price of rubber. (Increased rubber production elsewhere brought the plan to failure.) 1923: After overproduction of coffee in Brazil, the Brazilians introduced a coffee valorization plan, which sought to raise the export price of coffee. 1926: Cuba restricted exports of sugar, seeking to raise the price of that commodity; the principal exporters of copper sought to control world prices (on a private basis, without government participation). 1929-32: The Great Depression affected primary producers severely. The terms of trade moved sharply in favor of industrialized countries as prices of primary commodities sank more rapidly than the prices of manufactured items. With prices of primary products reaching new lows, underdeveloped countries erected high barriers to imports—tariffs, quotas, exchange controls, etc. They sought to manufacture for themselves; governments and private interests participated in more concerted attempts to raise export prices. 1931, Feb.: International Tin Restriction Scheme involved the governments of Malaya, Netherlands East Indies, Bolivia, and Nigeria (Thailand joined the agreement, July 1931); May: sugar agreement made between trade associations of exporters designed to raise price of sugar in world markets; 1933, Apr.: International Tea Agreement signed by exporters, the governments of India, Ceylon, and Netherlands East Indies agreed to uphold the agreement; 1934, June: International Rubber Agreement involving the governments of Britain, Holland, Siam, and Indochina sought to regulate rubber exports; 1936: agreement between producers of copper in Chile, Northern Rhodesia, and the Belgian Congo was designed to raise copper export prices. 1933-37: Although the terms of trade swung back slowly in favor of the primary producing countries, the volume of trade remained low. Foreign trade of less developed countries languished. 1938: Terms of trade once more turned against the less developed countries. 1939, Sept.-1940, May: Prices of primary commodities

rose rapidly, stimulated by wartime demands. 1940, May. Following the German invasion of Europe, curtailment of markets for much of the output of primary producers; 1941, Dec. ff.: after Japanese invasion of Southeast Asia, commerce in vegetable-oil seeds from the Philippines, the Netherlands East Indies, and Malaya ceased, the Philippines stopped exporting sugar to the U.S. Britain could no longer buy tea from the Netherlands East Indies and China. Burma, Indochina, and Thailand no longer exported rice. Rubber and tin exports to the allies from Japanese-controlled territories were cut off, as were exports of manila hemp and petroleum.

FOREIGN INVESTMENT. Foreign investment dominated certain economies. 1920-45: Oil in Venezuela and the Middle East was developed by foreign capital; copper in Chile once more became an important export because of American capital, in Northern Rhodesia and the Belgian Congo, copper was found and mined on a substantial scale because of foreign investment. Foreign investment grew in South African mining. 1920's: Railroads, gas, electricity, water supply, river transport, banking, and some factories in the Middle East remained under foreign control; Middle Eastern export trade was handled in the main by foreign concerns, the key interests were the French and British in Turkey (the Germans lost much of their stake after World War I); French, British, and Belgians in Egypt; British in Iran (the Russians retreated from their investments after World War I) and the French in the Levant. In India, large scale British investments continued to be important. The modern sector in China was both stimulated and dominated by foreign capital; the largest Chinese coal mines were in foreign hands (Japanese and British), the iron and steel industry was under foreign control, modern plants (for export) were under foreign hegemony; in fact, a significant portion of China's transportation, trade, and large-scale banking was owned by foreign capital. In the Netherlands East Indies, rubber, tin, coal, oil, sugar, and tea still attracted giant Dutch investments. Huge British (and Chinese) in-

vestments were made in Malayan tin and rubber. French Indochina obtained French (and to a far smaller extent Chinese) investment in rubber, coal mining, and the export trade. The bulk of foreign investment in less developed countries was in primary production or in infrastructure (transportation, port facilities, public utilities, etc.). 1930's: Opposition in many less developed countries to foreign investment became increasingly apparent. In some countries the opposition came at the same time as these countries were assuming political controls over their own economy; this was not the case in Latin America, where the opposition had nothing to do with the resumption of political sovereignty, although often it was expressed in terms of hostility to political intrusions. In Latin America the foreign investor was put under new restraint; profit remittances were blocked; exchange was not granted for imports; hampering restrictions on operations were frequently imposed. 1937: The Brazilian constitution limited foreign investments in water power and mining, banks and insurance cos., and public utilities; oil refining and production in Brazil were confined to Brazilian nationals. Bolivia expropriated the Standard Oil Co. (N.J.) oil refineries; Mexico completed nationalization of railroads. 1938, 18 Mar.: Large-scale expropriations of foreign oil properties in Mexico. Late 1920's: In Turkey, after the Kemalist Revolution, foreign debts were reduced through defaults, negotiations, and some repayments. 1929 ff.: Turkey bought out foreign investments in railways, coal and copper mines, the tobacco monopoly, and a number of public utilities; legislation in Turkey regulated foreign investment, licensed imports, and offered preferential treatment to Turkish business. 1930's: New capital raised in Egypt increasingly came from domestic rather than foreign sources. In India, sentiment turned away from encouraging foreign investment. In Thailand restrictions on foreign control of industries were imposed; the Thai government became involved in many industries in order to forestall and to substitute for foreign investment. In China the government sought alterna-

tives to foreign capital. 1930's: The flow of capital from industrial to underdeveloped countries slowed down because of the depression and because of hostility to foreign investment. (Only oil exploration and production continued to attract major foreign investments.) 1938-48: British investment in India declined by over 80%, in large part because of the liquidation of British railway holdings and sterling loans; by 1944, Indian railroads had become the property of the government of India. 1941-45: Introduction of American lend-lease and the financing by the U.S. Export-Import Bank of development in Latin America added a new dimension to foreign investment, the dimension of foreign aid.

Effect of foreign investment: 1919 ff.: Foreign investment, as in previous years, proved highly disruptive to traditional societies. Africans and Asians were thrust into a monetized economy, due in considerable part to the presence of foreign investment. Most Latin Americans were already involved in a money economy, although in the Andes the presence of new and large mining enterprises served to introduce Indians into a commercial economy. Foreign investment introduced new desires for goods, the demonstration of a different pattern of life. It developed previously unused resources. Yet clearly less developed countries were going to carry on their growth with reservations about foreign investment.

BUSINESS ORGANIZATION. Underdeveloped countries generally had a range of business organization, from the labor-intensive, capital-short family unit to the large foreign-owned modern sector establishment (generally involved in extractive industries, plantations, public utilities—transportation and power—and/or distribution). What was in between depended on the country. In much of Latin America and Asia, indigenous traders and businessmen transferred their activities to the modern sector. Immigrants served to introduce novel business practices. In Latin America and in India, entrepreneurial efforts spread over a variety of ventures rather than being concentrated in a single industry. Entrepreneurship in Latin America was stimulated by Italian

immigration (especially in Brazil and Argentina) and also by Jews who left Germany during the Hitler years. In India the Tata family diversified into various ventures in the modern sector. Of the Hindus who entered modern industry, enterprise came to be in the hands of the former bankers, moneylenders, and traders (primarily the Marwaris, the Gujaratis, and the Bhatias). In India commercial commitments began to be transformed into industrial interests. The Birla family, of the Marwaris caste, came to participate in a range of industrial enterprises under the aegis of Ghanshyandas Birla (b. 1894) and B. M. Birla (b. 1904). In India the managing agent system, initially in British hands, came increasingly under Indian control. While the managing agent did direct Indian capital into industrial activities, the system had major inadequacies; it seems to have offered a poor foundation for industrial finance; profits frequently went to the managing agent rather than into the specific industrial enterprise, leaving the latter with insufficient funds for reinvestment. In China the problems of developing nonforeign, modern, efficient industrial business organizations were not surmounted. There emerged in China nothing comparable to the Japanese *zaibatsu* or even to the Indian managing agencies; no entrepreneurs of national stature such as the Tatas or the Birlas existed in China. In Southeast Asia, however, Chinese entrepreneurs continued to play important roles in stimulating business enterprise. Syrians and Lebanese in Africa (as traders rather than in industry) were important entrepreneurs. In East Africa, Indians, mainly in the retail trade, filled entrepreneurial functions. In South Africa, British immigrants created new businesses. In less developed countries, governments started to become involved in industrial activity, especially in Latin America.

GOVERNMENT POLICY. Government efforts to mobilize resources for economic development in some less developed countries began to take shape.

Aid to agriculture: Government aid to agriculture took various forms: (1) in certain countries, land reform occurred, generally designed to assist the small

farmer; (2) on occasion, when farmers were hurt by imports, governments imposed protective tariffs (thus, 1931, India placed import duties on wheat); (3) governments (colonial and independent) offered new agricultural credits (from India to China to Mexico to Chile); (4) imports of agricultural implements were made duty-free in countries such as India to encourage their use; (5) governments sought to commercialize agriculture; (6) 1933 ff.: Chinese government planned projects in land reclamation, irrigation, water conservation, and reforestation; the Chinese government sought to introduce scientific methods, but its efforts in this direction were not successful; and (7) when world prices of agricultural commodities declined (in the 1920's, and especially in the early 1930's), governments tried to stabilize prices through participation in worldwide commodity agreements.

Aid to industry: Underdeveloped countries made use of the tariff and other protective devices to encourage industry. 1920's, and especially in the 1930's: In Latin America high protective tariffs became commonplace. 1920's and 1930's: Less developed countries that had been deprived of tariff autonomy by unequal treaties reassumed their right to establish their own tariffs and to protect nascent industry. 1921, June: India obtained fiscal autonomy and for the 1st time had the right to establish her own protective tariff; a Tariff Board was established to consider the need for protective duties. 1920's: Certain Indian industries (steel the most important of them) were given protection from imports; no protection in India was granted to locomotive building, steel casting, or enamelware, for example, because these industries were seen as having little possibility of developing. 1927: Thailand recovered tariff autonomy. 1929: China recovered tariff autonomy effective 1 Jan., 1931: customs duties were increased. 1929, June: High protective tariff introduced in Turkey with the goal of encouraging Turkish industrialization. (The Capitulations had been abrogated in 1914 and Turkey could set its own tariffs.) 1929-33: Practically everywhere in the less developed world,

tariffs rose and other restrictions on trade (quotas, prohibitions, exchange controls, etc.) were imposed. 1930's: Latin American governments aided industry through exempting from import duties machinery needed in building plants and by granting other tax exemptions.

Participation in the economy: In the independent nations rather than the colonial countries, governments took on a direct role in the economy. 1920's: A government oil co. in Argentina sought to develop oil resources. 1924 ff.: Turkey began to take over railroads, public utilities, and mines that had previously been in the hands of foreign investors. 1930's: Thai government became directly involved in shipping, in the oil industry, teak lumbering, production of sugar, tobacco, alcohol, silk, and other consumer goods. 1937: Bolivia nationalized Standard Oil Co.'s (N.J.) oil facilities in that country; Bolivia established a national oil co. 1938: A government-owned Mexican oil co. was established to operate the nationalized facilities there. 1939-45: A Chilean government co. participated directly in industry.

Development plans: 1920: The Gold Coast began a 10-year Development Plan. "The Guggisberg Plan," one of the earliest development plans. 1925-41: Riza Pahlavi (1877-1944), shah of Iran, undertook reform programs, resulting in improved public sanitation and education. 1931, Nov.: National Economic Council established in China to draw up a plan of work most needed. 1934: Mexico adopted a 6-year development plan; Turkey committed itself to a 5-year plan, aimed at industrializing the country. 1935, 24 May: Portugal passed a Law of Economic Reconstruction. 1937: Cuba adopted a 3-year plan for economic and social reconstruction. 1938: Venezuela initiated its 1st 3-year plan; in India, a National Planning Committee was established, with Nehru as chairman. 1939: Corporación de Fomento de la Producción (CORFO) established in Chile; this government corporation was designed to plan and promote economic development; 1939-45: CORFO became involved through direct stock participation in min-

ing, steel, agriculture and stock raising, fish packing, radio production, public utilities, electrical products, wine distribution, reforestation, chemicals, pharmaceuticals, dyes, etc. 1940: Colombia adopted a development plan. 1944: Paraguay announced a 5-year plan; Puerto Rico's Planning, Urbanizing, and Zoning Board prepared a development plan.

Problems: Government aid to economic development in the less developed countries was in many instances impeded: (1) In certain countries, chaotic political conditions, lack of full government control, tended to vitiate the power of government; in China, for instance, the failure of government to keep peace and order was an important factor inhibiting economic advance, in many industries, China had the potential of Japan, but did not realize it because of political uncertainties; with life and property in jeopardy in the interior of China, investors were discouraged. Similarly, in other countries where political uncertainty prevailed, economic development was retarded. (2) Corruption and excessive bureaucracy in the governments of many less developed countries tended to slow development. (3) While they sought to create peace and order, while they discouraged corruption, and while they promoted economic development (which would provide more funds to administer the colony and which would utilize unused mineral resources and increase agricultural production), colonial governments in general did not encourage factory industries for fear their development would curtail the colonial powers' exports.

OTHER FACTORS. 1930's: The growth of nationalist feeling occurred in the less developed countries, some of which was due to the new tariffs, behind which the countries developed their own national identity; much of the rise of nationalist feeling stemmed from a hostility to foreign "colonialists." Likewise, the impact of the West on Asia had resulted in many Asians adopting western ideas of nationalism. With World War II, ideas of nationalism were reinforced; in China and Southeast Asia, opposition to the Japanese stimulated national feeling. This

would have important impact in the post-World War II years. Likewise, western ideas of modernization spread and had their impact. The demonstration of the material achievements of Europe, the U.S., and Japan had ideological consequences. More important, beliefs in change and progress began to spread in the less developed countries. Traditional societies were increasingly under stress.

MEASURES OF ECONOMIC GROWTH.

NONMONETARY INDICATORS OF RELATIVE NATIONAL CONSUMPTION LEVELS, 1934-38 (U.S. = 100)

Argentina	53.7
Cuba	41.0
Spain	36.8

COMMUNICATIONS. 1944: Radio-telephone service connected more than 70 countries, a person in the U.S., if it were not for the war, could be connected by telephone with any one of 93% of the world's telephones.

FINANCE. 1919: Disruption of European finance after the war. 1919: Return to the gold standard by the U.S. 1920-21: Worldwide recession. 1922 ff.: General readoption of the gold standard:

1922: Lithuania and Latvia

1924: Germany, Sweden, and Hungary

1925: Britain, Holland, Neth. East In-

dies, Australia, New Zealand, South Africa, Switzerland, and Austria

1926: Canada, Finland, and Belgium

1927: Denmark, Czechoslovakia, Poland, and Italy

1928: France and Norway.

The key trading countries that did not adopt gold in these years were Brazil, Spain, and Turkey, which kept on an inconvertible paper basis, and China and Persia, which maintained the silver standard. 1929-33: Worldwide depression. 1929 ff.: Departures from the gold standard included:

1929, Dec.: Argentina

1930: Australia and New Zealand

1931, July: Germany, Hungary, and Chile initiated exchange control

1931, 21 Sept.: Britain left the gold standard

1931, 21 Sept. ff.: Denmark, Norway, Sweden, Finland, India, Japan, and Colombia suspended gold payments; Austria, Greece, Czechoslovakia, and Italy introduced exchange control.

1932, Apr.: 24 countries had suspended the gold standard and in 17 countries the gold standard was virtually inoperative. Temporarily, U.S., Belgium, France, Holland, and Switzerland formed a gold bloc. Britain led a sterling bloc, represented by those countries whose currencies were depreciated in terms of gold and in varying manners tied to the pound; the latter countries had most of their monetary reserves in sterling. The bloc included the Commonwealth countries (except Canada, Newfoundland, Hong Kong, and South Africa), the Scandinavian countries, Portugal, Finland, Iran, Greece, Egypt, Iraq, and Siam. Argentina, Bolivia, and Japan came to be on the fringe of the sterling bloc. 1933, Mar.-Apr.: U.S. went off the gold standard. 1935, Mar.: Belgium left the gold standard; 1936, 26 Sept.: France in effect suspended the gold standard. Holland, 27 Sept., Switzerland, 28 Sept., followed. 1930's: General disruption of international finance. 1939: The sterling bloc came to an end, and was replaced by the so-called "sterling area" comprising much the same countries. 1939, Sept.: Free convertibility of pounds into dollars, gold, and other outside currencies was abandoned, with the

outbreak of war; exchange controls applied. 1939, Sept.-1945: Disruption of international finance with the war.

5. Wheat (incl. flour)	710
6. Wool and hair	700
7. Automobiles and parts	640
8. Petroleum products	600
9. Coal	575
10. Rubber (nonfabricated)	520

war in the 1910's. 1944-45: One scholar (W. S. Woytinsky) estimates that in relation to world income, the value of foreign investment was probably not much more than $\frac{1}{4}$ and certainly less than $\frac{1}{3}$ of what it had been in 1911 on the eve of World War I (His estimate takes into account the lower purchasing power of the dollar, the rise in world population, and the growth in world income)

INTERGOVERNMENTAL INSTITUTIONS. 1920, 10 Jan: League of Nations formally came into operation with a membership of 64 nations; the U.S. did not join. 1920 ff.. Economic activities of the League and its committees were undertaken by its Economic and Financial Organization. Conferences held by the League dealt with such economic problems as raw-material resources, statistical co-ordination, simplification of customs formalities, etc. The League undertook

special studies of economic problems. The Economic and Intelligence Section of the Secretariat made country data available on a comparative basis for the 1st time. The League's economic activity was mainly in research, but it did take concrete actions: 1922: the League aided in arranging for the post-World War I rehabilitation of Austria, Hungary, Greece, Bulgaria, Estonia, the Free City of Danzig, Albania, and the Saar Territory. 1935: The League advocated economic sanctions against Italy, a highly unsuccessful act. 1943-45: Plans for post-war international institutions multiplied. 1943, May: International conference at Hot Springs, Va., proposed a permanent body to consider problems of an adequate food supply for increasing world population. Such a body (the Food and Agricultural Organization) came into existence in 1945. 1943, Nov. United Nations Relief and Rehabilitation Association created to arrange supplies of food and clothing to allied nations after their liberation. 1944, summer. Conference at Bretton Woods, N.H. 2 new institutions were to be created, an International Monetary Fund and an International Bank for Reconstruction and Development; they started operations in 1945. Thus were the foundations for postwar international co-operation in the economic sphere established.

1945-1968

The Industrial Nations

AGRICULTURE. The main trends in agriculture in the industrial nations were (1) 1945-68: Agriculture represented an increasingly smaller percentage of gross domestic product in the major industrial nations. Only in the USSR did agriculture still involve a substantial portion of GDP. (2) 1945-68: Population participating in farming declined in all the industrial nations. (3) 1945-68: Output per man-hour (productivity) of those individuals employed in agriculture rose,

primarily because of increasing mechanization and application of chemical fertilizers, insecticides, and improved seeds. Despite the reduction in farm population, total agricultural output everywhere grew. Yet in some countries the rise was outpaced by the nations' population growth. 1965: For example, per capita output in the Soviet Union was less than in 1958. (4) Agriculture tended to become capital-rather than labor-intensive. (5) 1945-68: No general trend existed in the amount

% OF GDP AT FACTOR COST OF AGRICULTURE,

of land under cultivation. 1945-66: In the U.S. acreage harvested dropped from 354 to 296 m. acres. 1954-57: In the Soviet Union, 90 m. acres of virgin land were put under cultivation, substantially raising the acreage harvested. (6) Attitudes toward conservation: 1915-68: Industrial nations were in general conscious of the need for conservation of land resources; in this respect Soviet agricultural policy was a major failure. 1915 ff.: In an attempt to raise Soviet agricultural output per annum, policies under both Stalin and Khrushchev showed no concern for subsequent harvests or long-run agronomic consequences; crop rotation and soil preservation measures were neglected, farms became denuded of feed and seed grains. 1961, Oct.: Introduction in the Soviet Union of the "plow-up" program, seeking to replace "low-yielding" crops (sown grasses and oats) and fallow with "high-yield" crops (peas, beans, and sugar beets); the plan was a failure. 1964, Oct. ff.: After the fall of Khrushchev, caused in part by his failure in agriculture, more attention was paid in the USSR to providing for long-term agricultural planning and to conservation of farm resources. (7) Land tenure and ownership: With the exception of Japan and to some extent the USSR, there were no major changes in land tenure and ownership relations in industrial nations, although there were alterations in the size of the farm unit under cultivation. Private property in agriculture remained the norm in North America, Western Europe, Japan, and Australia. (In Russia there were some conces-

sions to private property.) In the U.S. large corporate enterprises became involved in agriculture, farm size rose. 1916, Oct.: Farm Land Reform Law passed by the Japanese Diet, a key land reform, insisted upon by the occupation forces: absentee landlordism was prohibited but a landlord might keep up to 2½ acres in the area in which he lived; a cultivator could own as much as 7½ acres for his own use and also could have an additional 2½ acres, which he could rent; under the land reform about 5 m. acres were redistributed and about 2 m. tenants became landowners; the reform removed major inequalities in ownership. In the Soviet Union landownership relations underwent some changes, and important revisions in government policies occurred, including changes in attitudes toward collective farms, state farms, and private plots, changes in the degree of central government control of farm production, greater utilization of economic incentives, and a more favorable attitude toward larger farm units; collective farms that averaged 1,000 acres in the 1930's averaged by the 1960's 15,000 acres (1960's: state farms averaged 30,000 acres). (8) Agricultural self-sufficiency: The U.S., Canada, and Australia had agricultural surpluses, which they exported. Under normal conditions, the USSR was agriculturally self-sufficient but, 1963-65, the Soviet Union made wheat purchases of \$1½ billion from Canada, Australia, and other non-Communist countries, which suggested that her agricultural production was deficient. 1958 ff.: The European Common

Market countries together produced a surplus of lard, milk, fruit, potatoes, and vegetables; were self-sufficient in butter and cheese; produced 90-99% of meat, fish, rye, eggs, beet, sugar, and wine, 80-89% of their barley, corn, wheat, and rice, but imported over half their needs for citrus fruits, tobacco, cane sugar, cotton, and dried fruits. Japan required imports of foodstuffs to supplement her home-grown supplies, but her dependence on foreign supplies of food was less than in the pre-World War II years, owing to improvements in Japanese agriculture. Britain continued to be a large importer of foodstuffs. In the West all the industrialized nations subsidized agriculture to keep agricultural output higher than it would be were the market mechanism relied upon. (9) Trade in agricultural produce: 1945-57 Trading patterns for agricultural exports and imports of the industrial countries shifted, but no newly defined trend emerged 1957-68: The key innovation in commerce in agricultural products came about with the adoption of an agricultural policy for the European Economic Community, 1957, 24 Mar.: By the Treaty of Rome, France, West Germany, Italy, Holland, Luxembourg, and Belgium committed themselves to act in the European Economic Community (EEC) to encourage increased agricultural productivity, to obtain for agricultural workers a fair standard of living, to stabilize agricultural markets, to develop regular and adequate supplies of farm produce, and to assure the consumer agricultural produce at a reasonable price. The EEC had difficulty in formulating the specifics of a common agricultural policy because of differences among the member countries. 1962, Aug.: 1st of the Market's regulations to implement a unified agricultural program came into force, representing the start of common policies on price, community financing, and commercial relationships. 1967, 1 July: A common market for cereals, pork, eggs, and poultry emerged; all restrictions on trade in these farm products among the 6 member nations ceased; external tariffs on these products became uniform. 1968,

1 July: A common market came into existence for all the Community's agricultural output. (10) 1945-68: In the domestic distribution of food products in industrial nations, the spread of the sale of frozen foods to the consumer represented an important trend.

RAW MATERIALS. Coal: 1945-68: Industrial nations remained large producers of coal, but as technology changed and as oil, natural gas, hydroelectric power, and nuclear power became more important sources of energy, coal industries in the U.S., Canada, Britain, and West Germany did not grow.

Oil: With the exception of the U.S. and USSR, the key industrial nations remained importers of oil. The U.S. was—as in the past—the world's largest oil producer; the USSR was in 3rd place after Venezuela. 1961: Oil output in the USSR surpassed that of Venezuela. 1947: Oil discoveries at Le Duc, south of Edmonton, Alberta, Canada, opened up new oil fields in that country.

CRUDE OIL PRODUCTION

a 9,000 metric tons

Natural gas: 1945-68: Major deposits of natural gas were located in the U.S. and the Soviet Union. Canada's gas fields in southern Alberta and in the Peace River area on the Alberta-British Columbia boundary came into production. 1950's: Discovery of natural gas deposits in Italy; France had a gas field in the Pyrenean foothills; 1959: discovery of Groningen gas field in the Netherlands; 1966: natural gas discoveries in the North Sea and Britain. Natural gas was expensive to transport and its use depended on

its nearness to the consuming markets; thus these discoveries were a boon to Western Europe.

Technological changes: In the raw-materials industries, technological changes brought increased mechanization. 1948: Introduction in U.S. of a continuous-mining machine for use in coal mining—a major step in raising productivity. Technological change also improved resource utilization. Natural gas, pumped into oil wells, increased the output of these wells. Deep-drilling and offshore-drilling techniques opened up new oil resources. 1967, 10 Dec.: World's 1st use of a thermonuclear blast to release inaccessible natural gas took place in New Mexico. Late 1950's: As high-grade iron ores in the Lake Superior region became exhausted, Americans began to use formerly neglected taconite ore, which was pelletized by a new process. 1957, 13 Sept.: Large-scale commercial production of taconite

started in the U.S.; this provided the basis for the revival of the Mesabi Range. In nonferrous minerals improved processing methods offered possibilities of using low-grade ores; technological change made it possible to utilize formerly wasted minerals and thus enlarged the resources of developed nations. Slag—once rejected as waste—became of interest to mining engineers. Technological change also altered the demand for minerals; 1950's: uranium, for example, was at a premium because of the requirements of atomic energy.

The synthetics revolution: Despite continuing replacement of primary raw materials by synthetics, there remained many raw materials for which there were no substitutes and industrial raw materials continued in high demand in the industrial nations. Moreover, the chemical industry, in its production of synthetics, began to place new demands on formerly wasted raw materials.

Political problems: 1946, 23 July: Strategic and Critical Materials Stockpiling Act sought to assure the U.S. of essential raw materials. 1950, 9 May: Robert Schuman, then French minister of foreign affairs, proposed that France and Germany put their coal and steel production under a supernational authority: Schuman favored inviting other nations to participate; the so-called Schuman Plan emerged from French concern over the economic revival of Germany. 1951, 18 Apr.: Treaty establishing the European Coal and Steel Community (ECSC) was signed by the foreign ministers of France, West Germany, Italy, Luxembourg, Belgium, and the Netherlands; the treaty—following the Schuman Plan—aimed to eliminate internal trade restrictions for coal and steel products and to encourage free movement of productive resources among the 6 nations. 1953, Feb.: An ECSC free-trade zone, involving iron ore, coal, and scrap, came into existence and all intra-Community tariffs on these commodities were eliminated; the resources of the member nations effectively complemented one another. The ECSC was a predecessor to the EEC.

ENERGY. Fossil Fuels: 1945 ff.: Coal, which once represented the primary

source of low-cost energy, increasingly met competition from forms of energy available at still lower cost. Oil provided 1 alternative; natural gas, which on the basis of energy content was substantially cheaper than fuel oil, also competed.

1964: Coal still represented the main primary source of energy in the U.K., Germany, and the USSR, but it no longer held this position in the U.S., Canada, or France, where oil and natural gas stood supreme.

1964-68: USSR shifted increasingly away from use of coal for energy, as did Britain and Germany.

Internal-combustion engine: 1945-68: The internal-combustion engine continued to be the best form of propulsion for automobiles and other motor vehicles. Innovations in the internal-combustion engine consisted primarily of higher horsepower units.

Electrical energy:

ELECTRICITY PRODUCTION IN SELECTED COUNTRIES AND REGIONS (billion kwh)

	1948	1965
U.S.	336.8	1,157.1
Europe (excl. USSR)	249.0	996.1
USSR	66.3	506.7
Japan	35.6	192.1
Canada	47.2	144.3
Australia	8.3	35.7

SOURCE: United Nations, *Statistical Yearbook 1966*.

1960-68: Stimulated by concern about air pollution, experiments in the U.S., Japan, and elsewhere were made with electric-powered automobiles; storage batteries were given trials but had to be replenished after each discharge by a relatively long process of recharging; fuel cells were devised which continued to function after a few minutes of "refueling"; the work on fuel cells was still experimental, and the advantages of the electric propulsion remained the same as in 1900: short range, low power, high cost, and high weight-to-energy ratio. 1945 fl.: Diesel-electric engines proved the most satisfactory form of propulsion for railroad locomotives.

Rocket power: 1945-68: Rocket power for propulsion came increasingly into use; the turbine-powered automobile, experimented with as early as 1928, was not manufactured commercially, but jet-powered airplanes became commonplace. Rocket power made possible the "space age".

Nuclear power: 1946, 1 Aug.: Mc Mahon Act in U.S. established the Atomic Energy Commission. 1947: North American Aviation report dealt with the possibility of applying nuclear power to missile propulsion (a nuclear rocket); research along this line met with serious technical problems, but continued. 1951: The feasibility of producing electric power by using a nuclear reactor to replace the boiler in a thermal power plant (or to substitute for a hydro plant) was demonstrated in the U.S. by the Atomic Energy Commission, which with its Experimental Breeder Reactor developed 100 kw of electricity. 1954, 21 Jan.: U.S.S. *Nautilus*, the 1st atomic-powered submarine, was launched at Groton, Conn. 1954: Formation of Atomic Energy Authority in Britain to take over British atomic facilities built since 1945. 1956,

17 Oct.: The world's 1st full-scale nuclear power station opened at Calder Hall, Cumberland, England, and Britain took world leadership in production of electrical power using nuclear energy. 1957: Shippingport Atomic Power Station in Pennsylvania went into operation, becoming the 1st nuclear plant in the U.S. to produce commercial electrical power; 1st Soviet nuclear power plant also went into operation; establishment of the European Atomic Energy Community (Euratom) by Treaty of Rome signed by France, West Germany, Italy, Netherlands, Luxembourg, and Belgium; the function of Euratom was to aid in the development of atomic energy for peaceful purposes. 1958: Soviet Union launched a nuclear-powered icebreaker. 1958 ff.: Production of electricity by nuclear power spread.

WORLD PRODUCTION OF ELECTRICITY BY NUCLEAR ENERGY
(billion kwh)

^a 1964.

1965-66: Cost of generating electricity with nuclear power went down sharply, because of improved reactors and because the cost per kwh declined as nuclear power plants increased their capacity. 1966: 1st year that orders for nuclear power generation equipment in the U.S. exceeded all other types of power facilities.

Other new sources of power: 1950's and 1960's: Work was under way in the U.S. and Britain on magnetohydrodynamics, the process of generating electricity by shooting ionized gas through a magnetic

field. New developments took place in the U.S. and Western Europe and in New Zealand in using tidal energy, wind energy, solar energy, geothermic energy, and thermal energy of the sea. 1955, 31 Aug.: A sun-powered automobile was demonstrated in Chicago; Oct.: 1st solar-powered telephone call made by customer of regular Bell Telephone System. 1957 ff.: Italy, New Zealand, and the U.S. developed electrical production using geothermal energy. Developments in space-age sciences brought forth a new variety of

techniques for generating power. 1959, 19 Jan.: U.S. Atomic Energy Commission demonstrated a 5-watt radioisotope thermoelectric generator. 1960, 18 Apr.: National Aeronautics and Space Administration let contracts for an electric rocket; 4 May: tests made in the U.S. at Lewis Research Center of hydrogen-oxygen high-energy engine; 17 June. Lewis Research Center undertook tests of hydrogen-fluorine engines. 1960's: In the U.S. and Western Europe, experiments were made with optical lasers, a potential source of power. 1966: Union Carbide in the U.S. developed a hydrogen-oxygen fuel-cell system used to power an experimental delivery van.

INDUSTRY AND TECHNOLOGICAL CHANGE. Postwar reconstruction: 1945 ff.: Industrial development in Europe and Japan involved rebuilding the damaged industrial plant. In North America and Australasia, by contrast, there was no wartime damage, the task involved conversion to peacetime production. 1945 ff.: American foreign aid contributed importantly to rebuilding Europe and Japan. 1948: Every principal Western European country (except West Germany) had reached or surpassed its 1938 level of production. Late 1947–early 1948: Decision made to let Germany rebuild its industry. SCAP (Supreme Commander of the Allied Powers) in Japan similarly decided to encourage Japan to rebuild. 1951: West Germany surpassed its 1938 level of production; 1953: Japanese manu-

facturing reached the 1938 level. 1950's: Major rebuilding of industry in Soviet Union, parts of Eastern Europe, Western Europe, and Japan.

Automation: 1947: Delmar S. Harder (b. 1892) and John Diebold (b. 1926) used the word "automation." The word came to mean anything from the use of machines to run machines, to a controlled operation of an entire process, involving machines that automatically performed their operations, using an electronic judgment ("feedback"). 1950's and 1960's: The feedback element of automation became crucial—electronic controls inspected, approved, and corrected industrial work in the process of manufacture. Automation came of age with the computer and was applied in most industries.

Steel: 1950 ff.: Worldwide introduction of the basic oxygen process, which refined pig iron into steel by injecting jets of oxygen into a molten pool of pig iron; the process produced high-grade steel, more quickly and efficiently than older methods, at lower investment and operating costs. It was a major innovation. 1950, Nov.: VOEST, a nationalized Austrian steel company, using the patents of German C. V. Schwarz (issued in 1943) and of Belgian John Miles (issued in 1946), completed its tests of the oxygen process. 1952: VOEST was the 1st firm in the world to go into commercial production of steel using the oxygen process. 1954: A Canadian plant, Dominion Foundries & Steel Co., introduced the process in the

1950-68: The largest car producers in the U.S. remained General Motors, Ford, and

Chrysler. In Germany, Volkswagen (a nationalized German company, established in the 1930's in response to Hitler's demand for a cheap car) and Opel (a GM subsidiary) led the industry. In Britain the British Motor Corp. (formed in 1952, uniting Morris and Austin) along with Ford Motor Co., Ltd. (a Ford subsidiary), led that nation's industry. In Italy, Fiat was the pace-setter.

Chemicals: 1950's and 1960's: The large petroleum cos. took part in the chemical industry, making a range of petrochemical products. The pharmaceutical industry witnessed a veritable revolution in the manufacture of drugs, serums, and vaccines. With antibiotics, new vaccines, and new methods of treatment, the industry was transformed. The U.S., Britain, and Germany led in the world's chemical industries. Japan also developed a substantial chemical industry; it was especially active in the production of synthetic fibers, but also in other chemicals (see table, pp. 806-807).

Electricity and electronics: 1945-68: Electronics was a major growth industry; innovations were revolutionary; the television set was the most complex electronic product marketed commercially.

1948: Invention of the transistor by Americans John Bardeen (b. 1908) and W. H. Brattain (b. 1902), working under William Shockley (b. 1910) at Bell Telephone Laboratories, was the next stage in the electronics industry. 1950, 1 Mar.: Eckert-Mauchly Computer Co. acquired by Remington-Rand; 1951, 14 June: Remington Rand delivered (to the Bureau of Census) UNIVAC—the 1st production model of an advanced large-scale general-

purpose computer—a vacuum-tube computer; this was the 1st commercially produced computer. 1952: Masaru Ibuka, president of the Japanese Sony Co., obtained Bell Lab's transistor patents. 1954-61: Discoveries made by Bell Labs in the field of intermetallic alloys, through which electric current could be conducted without loss ("super-conductors"). 1954: International Business Machines (IBM) demonstrated the 1st large transistorized computer. 1955: Sony turned out the world's 1st transistor radio; 1957: Sony introduced the 1st pocket-sized transistor radio; 1958: Sony presented the 1st transistorized FM radio. Invention in the U.S. of the integrated circuit, which reduced costs of computer operations at a ratio of 3-1 over transistorized computers and increased the speed of calculations. 1959: Sony introduced the 1st all-transistorized television set. Use of vacuum-tube computers—the 1st generation of computers—had practically ceased; 2nd-generation transistorized computers had replaced them; these would now be replaced by the 3rd generation, integrated-circuit computer. (From the vacuum-tube computers of the early 1950's to the integrated-circuit computers of the 1960's, computers' capacity for calculation was increased 1,000-fold). Christopher Strachey, British mathematician, gave 1st public paper on time-sharing. ("Time-sharing" involved the utilization of a single computer by many individuals in diverse locations; 1961, Nov.: 1st demonstration of time-sharing at the MIT Computation Center, using 4 "remote" consoles in the same room.) 1960: Sony introduced the 1st transistorized videotape recorder. 1964: Charles H. Townes (b. 1915), American from MIT, and Russian scientists Nikolai Basov and Alexander Prokhorov won the Nobel Prize in physics for their work on lasers; 1964-68: research into the laser, a device for generating and manipulating light, brought forth varied applications to data display systems for computers, tunnel-boring machines, cancer surgery, plasma diagnosis, 3-dimensional photography, and communications (transmission over a light beam of TV programs). 1965:

Sony introduced the 1st transistor microphone; Union Carbide achieved the most powerful solid-state continuous-wave laser beam yet recorded. 1966: The IBM 360, a multipurpose computer line, using advanced microcircuitry, was introduced; Sony presented the 1st integrated-circuit radio. 1968: Prospects of large-scale (circuit) integration (LSI), with higher speeds, greater reliability, and lower costs, in the 4th generation of computers.

SPACE AGE. Prelude: 1945: The U.S. made the commitment to develop missiles for military purposes; Feb.: "Project Nike" initiated to seek new means of air defense against high-speed, high-altitude bombers, which were beyond the reach of existing artillery; 8 Mar.: 1st test launch of U.S. air-to-air missile; Aug.: components of about 100 V-2 ballistic missiles were shipped from Germany to the U.S. for study; Oct.: Secretary of War Robert P. Patterson (1891-1952) endorsed a plan to bring key German scientists to the U.S. to aid in military research and development; 1946, 22 Mar.: 1st American rocket launched to move outside the earth's atmosphere. 24 Oct.: U.S. launched a V-2 rocket carrying a camera and taking motion pictures of the earth at about 65 mi. above the earth's surface. 1947, 24 Apr.: French government established a rocket test range in Algeria. Sept.: U.S. "Project Rand" report indicated that earth satellites were technically feasible. 1948, 4 Nov.: U.S. Air Force announced the formation of the Rand Corp., successor to Project Rand, to assemble and develop the most advanced scientific, technical, industrial, and military knowledge relevant to Air Force decisions. 1949, 11 May: U.S.

SOME INNOVATIONS IN THE CHEMICAL INDUSTRY, 1945-67

		<i>Transportation and Communications</i>			<i>Tools and Equipment</i>	<i>Packaging</i>
<i>Food</i>	<i>Clothing</i>	<i>Shelter</i>	<i>Health</i>	<i>Communications</i>		
Selective and pre-emergent weed and brush killers	New synthetic fabrics, including 1950: introduction of "Orlon"	Silicone products, such as construction sealants, coating and surfacing materials	1945 ff.: New antibiotics, among them, 1948: aureomycin; 1950: terramycin; 1952: chloromycetin	Higher-octane gasolines	Silicones	Polyethelenes for packaging
Defoliation as harvest aid	acrylic fiber; 1951: introduction of "Dacron"	New paints and pigments		New lubricants	Low-cost sheet-forming dyes	
New insecticides (1947: 1st use of organic phosphates as insecticide; others followed)	polyester fiber, which became important in "wash and wear" garments; other synthetic fabrics	New insulation materials	Antihistamines	Nonflammable hydraulic fuel	Nylon machine parts	
Fungicides	Durable-press fabrics	Foamed plastics	Synthetic hormones	Range of new coating and insulation materials	Fluorinated hydrocarbons	
Soil conditioners	Inherent colors in man-made fabrics	Synthetic carpeting of tufted plastic	Cortisone for arthritis	Nylon tire cord	Expansion of electrochemical industries, making for better metals for tools and equipment	
Mold inhibitors			Radioisotopes 1952: Trans-	New uses of plastics in the automobile industry		

Range of new fertilizers and fertilizer-pesticide mixtures	Aerosol foam cleaners	quilizers	New synthetic rubber compounds	1955 Man-made industrial diamonds
Synthetic hormones for animals	New cleaning solvents, introduced into textiles as stain and water repellents	1955: Salk vaccine for poliomyelitis	New resins for reinforced plastics with applications in the utility, outboard motor, and transportation fields	Man-made industrial rubies
Animal disease-control agents (including antibiotics, and antioxidants)	1964: "Corfam," a synthetic material for shoe uppers	1956 Oral contraceptives; 1961: Sabin vaccine for poliomyelitis could be taken orally		
Liquid nitrogen systems for in-transit food refrigeration	Plastic protective helmets	1966 Measles vaccine		
		1967: Symmetrel, 1st oral chemical agent to work efficiently against influenza		
		1960's: Drugs for treatment of mental illness		

• SOURCE: Adapted from Manufacturing Chemists' Association, *The Chemical Industry Facts Book*, 3rd ed., 1957, with many additions.

President Harry Truman signed a bill providing for a 5,000-mi. guided-missile test range; it was subsequently established at Cape Canaveral (later Cape Kennedy), Fla. 1951, 4 Oct.: M. K. Tikhonravov declared Russian rocket advance equal to or superior to that of the U.S. and that the Russians believed the creation of artificial earth satellites and space flights were feasible. 1954, 29 Apr.: 1st launching in the U.S. of a 3-stage rocket vehicle, including 2 Nike boosters and a Deacon rocket as the 3rd stage; 14 Oct.: 4-stage solid-fuel rocket launched in U.S.; USSR established an Interdepartmental Commission on Interplanetary Communications to develop an earth satellite; 16 Dec.: U.S. Air Force announced that the Atlas Intercontinental Ballistic Missile (ICBM) was being constructed by Convair. 1955, 1 Dec.: Eisenhower gave highest priority to ICBM programs, especially the Thor and Jupiter projects. 1957, spring: Several Russian tests of ICBM's; 26 Aug.: Soviet News Agency announced that the USSR had a "few days" earlier successfully launched a "super long-distance intercontinental multistage ballistic rocket"; 20 Sept.: 1st successful launch of the U.S. Air Force's Thor Intermediate Range Ballistic Missile.

Space research and travel: 1957, 4 Oct.: Soviet Union launched Sputnik I (weighing 180 lbs.)—the earth's 1st artificial moon; 3 Nov.: USSR's Sputnik II (weighing 4 tons) carried a dog named "Laika." 1958, 31 Jan.: U.S. launched its 1st artificial earth satellite, Explorer I (30.8 lbs.); it discovered the presence of a

radiation belt around the earth. (6 Dec., 1958: Pioneer I, an American satellite, identified a 2nd radiation belt around the globe; these belts were called the Van Allen belts.) 17 Mar.: U.S. launched Vanguard I rocket to test solar cells; as a scientific satellite, it proved that the earth was slightly pear-shaped. 26 Mar.: U.S. launched Explorer III, which produced valuable information on the radiation belt, micrometeorite impacts, and temperatures. 15 May: Soviet Union put Sputnik III into orbit for aerodynamic studies; this satellite weighed about 7,000 lbs. 1 July: Japanese Kappa-6tw 2-stage rocket was flown to the altitude of 30 mi. above the Michikawa Rocket Center, Japan. 27 Aug.: Russians sent 2 dogs to an altitude of 281 mi. and safely returned them to earth. 27 Aug.: President Eisenhower signed Public Law 85-766, which included an appropriation of \$80 m. for a National Aeronautics and Space Administration (NASA), including \$50 m. for research and development and \$30 m. for other expenses. (1 Oct.: NASA officially came into existence.) 7 Oct.: NASA organized Project Mercury to (1) put a manned capsule into orbital flight around the earth, (2) consider man's reactions to and capabilities in space, and (3) find means by which the capsule and the pilot could be recovered without harm to either. 11 Oct.: U.S. launched Pioneer I, a space probe which went 70,700 mi. before returning to earth: it determined the extent of radiation bands, observed the earth's magnetic field, and made 1st studies of the density of micrometeors in space and 1st measurement of the interplanetary magnetic field. 1959, 2 Jan.: USSR put Lunik I into a solar orbit—the 1st man-made object placed in orbit around the sun. 3 Mar.: Pioneer IV was the 1st U.S. satellite to orbit the sun. 2 Apr.: The 1st 7 astronauts were selected in the U.S. for Project Mercury: Capts. Leroy G. Cooper, Jr., Virgil I. Grissom, and Donald K. Slayton; Lieut. Malcolm S. Carpenter; Lieut. Comms. Alan B. Shepard, Jr., and Walter M. Schirra, Jr. (U.S.N.); and Lieut. Col. John H. Glenn (U.S.M.C.). 12 Sept.: Russia's Lunik II launched; Lunik II became the 1st man-

made object to hit the moon. 4 Oct.: USSR launched Lunik III, which took the 1st photographs of the hidden side of the moon. 1960, 1 Apr.: U.S. launched 1st weather observation satellite, Tiros I (Television Infrared Observation Satellite), which inaugurated a new era in meteorological observation. 12 Aug.: Echo I, launched in the U.S., demonstrated radio communication by satellite. 19 Aug.: USSR launched into orbit Spacecraft II, weighing 5 tons and carrying 2 dogs and biological specimens; 21 Aug.: USSR announced the safe recovery of the dogs and the biological specimens from Spacecraft II, the 1st successful recovery of living organisms from orbit. 1961, 12 Apr.: Russian Yuri A. Gagarin made a 1-orbit trip in space and returned safely—the 1st man to fly beyond the earth's atmosphere. 5 May.: Astronaut Alan B. Shepard, Jr., was the 1st American in space. 6 Aug.: Maj. Gherman S. Titov, Russian cosmonaut, was launched into orbit in Vostok II; he made 17 orbits and returned to earth safely, 25 hours and 8 minutes later (7 Aug.). 1962, 20 Feb.: Lieut. Col. John H. Glenn, U.S. astronaut, was 1st American to orbit the earth, he orbited 3 times and returned safely; 7 Mar.: solar observatory satellite launched by the U.S. into orbit—the 1st of large 2nd-generation satellites developed by NASA. 26 Apr.: 1st international satellite (Ariel)—a British-American joint venture—launched from Cape Canaveral, with the goal of studying cosmic radiation. 10 July: U.S. launching of Telstar, a communications satellite. 11 Aug. and 12 Aug.: 2 manned Soviet space ships (Vostok III and Vostok IV) were launched into orbit; 12 Aug.: 1st live TV broadcast from a spaceship—from Vostok III. 15 Aug.: Vostok III and IV landed safely, Vostok III after 64 orbits and Vostok IV—6 minutes later—after 48 orbits. 27 Aug.: U.S. launched unmanned Mariner II on its 109-day mission to fly by Venus. (14 Dec.: Mariner II took 1st instrument readings of Venus's temperature, atmosphere, etc., as it flew within 21,100 mi. of the planet; Mariner II radioed these data 36 m. miles back to earth.) 1963, 14 June:

Vostok V, Russian spacecraft, manned by Lieut. Col. V. F. Bykovsky, was launched; 16 June, Russian Valentina Tereshkova, in Vostok VI, was 1st woman in space; 17 June, communications in space between Vostok V and VI. 20 June: Vostok V and VI landed safely; Bykovsky set new record by orbiting the earth 81 times, covering 2 m. miles (Tereshkova orbited 48 times). 16 Oct.: U.S. Air Force launched twin unmanned satellites, designed to detect nuclear explosions in space. 1964, 12 Oct.: Voskhod I was launched by the USSR—the 1st 3-man satellite. 1965, 18 Mar.: Russian Aleksei Leonov, leaving Voskhod II, took the 1st walk in space—duration 10 minutes; 23 Mar.: U.S. spacecraft Gemini III was pilot-manuevered during orbit by Americans Virgil Grissom and John Young. 3 June: Launch of Gemini IV, U.S. 2-man orbital flight, from which American Edward H. White took a 20-minute walk in space; 15 July: unmanned U.S. Mariner IV (launched 28 Nov., 1964) transmitted 1st photographs of Mars, from 10,500 mi.; subsequent photographs received from the satellite were from as close as 6,118 mi. from the planet. 21-29 Aug.: U.S. spacecraft, Gemini V, with 2 astronauts on board, made new world record—120 orbits. 26 Nov.: 1st French satellite launched. 4 Dec.: Gemini VII, U.S. 2-man orbital flight, launched; it remained in orbit for 14 days, a new record; 15 Dec.: Gemini VII made 1st rendezvous in space (with Gemini VI, launched 15 Dec.). 1966, 4 Feb.: Russian Lunik IX (launched 31 Jan., 1966) was the 1st spacecraft to soft-land on the moon; 1 June: U.S. 3-legged Surveyor I spacecraft landed on the moon. 1967, 27 Jan.: Fire in Apollo spacecraft on the ground killed 3 American astronauts—Virgil I. Grissom, Edward H. White, and R. B. Chaffee. 23 Apr.: Soviet cosmonaut Vladimir M. Komarov crashed on re-entry from space, the 1st known Russian space casualty. 18 Oct.: Russians made the 1st soft-landing of a capsule on the planet Venus; it found temperatures of from 104° to 536° F., and obtained other scientific information, which it relayed back to earth. (For

moon landing, see p. 652).

Supersonic transports: Anglo-French agreement to build "Concorde" supersonic airliner (1,400 mph), 26 Mar., 1962. U.S. decided to build prototype SST (1,750 mph), 29 Apr., 1967. On 31 Dec., 1968, Russian SST, TU-144 (1,550 mph), made 1st flight; 1st flight of Concorde, 2 Mar., 1969.

TRANSPORTATION. The dramatic spread of motor-vehicle usage was reflected in the rise of automobile and truck production. Construction of limited access roads accelerated, to meet the demands for new highways. 1964, 1 Oct.: The world's 1st high-speed (125 mph) modern passenger train was introduced in Japan. 1967, 4 Dec.: French wheelless "aerotrain" went 215 mph on a cushion of air—a world record for track vehicles; the train was powered by a turboprop engine. 1950's and 1960's: Growth of pipe-line facilities in major industrial nations to transport oil and gas.

Shipping: 1966: Figures on major nations' merchant shipping are misleading, because many American and other ships sail under foreign flags.

Air travel: 1945 ff.: Airplanes became a common means of traveling; passenger and, to a smaller extent, freight mileage by air mounted. Jet aircraft, used during the war, were improved upon by the

British, Americans, and Russians, initially primarily for military use. 1947, 14 Oct.: U.S. Air Force Capt. Charles E. Yeager made the 1st supersonic flight in a manned aircraft in level or climbing flight; flight was made in a rocket-powered research plane, the Bell XS-1 (later the X-1). 1950, Oct.: U.S. Air Force announced a plan to replace all piston-engined planes with jet aircraft. 1952, 21 Apr.: British Overseas Airways, with the De Havilland Comet, started the 1st jet passenger service—London to Rome. 1958, 4 Oct.: 1st commercial jet airplane crossing of the Atlantic made by BOAC; this inaugurated a new epoch in civilian travel. 1958: 1st year in which total number of transatlantic passengers by air exceeded the number of passengers by sea. 1960: World's scheduled airlines (excluding USSR and Communist China) carried 108 m. passengers.

Communications: 1945 ff. There was a remarkable growth in telephone, radio, and television usage in the industrial world.

The field of "telecommunications" blossomed. 1956: Bell Telephone Co. developed a "visual telephone," which would transmit pictures over telephone wires. 1960's: Development of long-distance xerography (introduced Dec. 1962); scanners and printers could operate reliably between cities miles apart; electronic blackboards were developed, which transmitted writing over a long distance on telephone wires (the writing received could be preserved). 1960, 12 Aug.: Echo I, launched in the U.S., demonstrated the

feasibility of radio communication by satellite. 1962, 10 July: Launching of Telstar I at Cape Canaveral made possible the 1st transmission of live TV pictures across the Atlantic Ocean. 31 Oct.: President Kennedy signed a communications satellite bill, establishing a private profit-making corporation (50% owned by the general public and 50% owned by utilities) to handle global communications by satellite. 1965, 2 May: TV 1st used "Early Bird," the U.S. Commercial Communications Satellite (Comsat).

FINANCE. International: 1945: U.S. emerged from the war a great creditor nation. Britain, by contrast, had become a debtor nation, as had France. Germany and Japan were in desperate need of foreign funds for revival. American foreign aid came to the assistance of Europe. The International Bank for Reconstruction and Development (established 27 Dec., 1945) had as one of its key purposes financing reconstruction. 1947: 1st IBRD loans went to Belgium, Denmark, Finland, Luxembourg, the Netherlands, and Yugoslavia. In Europe there developed a "dollar shortage," an inadequate supply of dollars at the established rate of exchange. Foreign-exchange controls remained. 1948, June: West German currency reform, wherein the reichsmark was exchanged for a new deutschemark at the rate of 10 to 1. 1949, 1 Apr.-18 Sept.: Britain's reserves declined by over \$500 m. 18 Sept.: Britain devalued the pound sterling, from \$4.03 to \$2.80; other countries followed. 1950, 1 July: European Payments Union (EPU) created to facilitate payments between member countries.

1950's: European nations increased their gold and foreign-exchange reserves; the dollar shortage began to disappear; U.S. balance-of-payments deficits became endemic. 1956, July: Egyptian government nationalized the Suez Canal. Oct.: The Suez Canal and oil pipe lines traversing Syria were closed. 1957, Apr.: reopening of Canal and partial restoration of oil pipe lines; the "Suez Crisis" put a severe strain on European financial resources. The International Monetary Fund played a prominent role in promoting international financial stability—aiding member nations. Nonetheless the franc continued to be weak. Aug.: France devalued the franc, the British pound seemed in jeopardy; Britain raised the bank rate to 7%—the highest level since the early 1920's—and the crisis was averted. 1958, 27 Dec.: Britain announced the immediate convertibility of the pound sterling by residents of countries outside the sterling area, earnings in sterling could thereafter be freely converted into dollars at roughly the official rate of \$2.80 per pound. Austria, Belgium, Denmark, Finland, France, West Germany, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, and Sweden made similar announcements. Most nations excluded capital from the convertibility provisions. France devalued the franc from 420 to 493.7 francs to the U.S. dollar. European Monetary Agreement came into force, superseding the now defunct European Payments Union; it aimed to promote convertibility of currencies and aid international trade; it was signed by the OEEC members. 1959-60: The right of convertibility for current transactions was extended by European countries to include their own members, restrictions on capital movements remained. 1961, Mar.: Germany revalued the mark upward. Aug.: The pound sterling was again under pressure and there was a threat of devaluation; again the crisis was averted. 1960's: U.S. balance-of-payments deficits continued; new weakness of the pound. 1967, 18 Nov.: Britain devalued the pound, making it worth \$2.40.

Domestic: 1950's: All the industrial nations committed a higher proportion of GNP to domestic investment than ever

before in their history, the U.S. excepted. (In the U.S. pre-World War I percentages were higher.)

Central Banks: In Europe especially, but also in other industrial countries, central banking policies sought to encourage a high rate of investment. Central banks became of key importance in controlling credit and regulating demand; they became instruments of economic planning.

Other banking facilities: 1945 ff.: Bank of International Settlements became in the postwar years an important European banking institution. 1958, 1 Jan.: In accord with the Treaty of Rome establishing the EEC, a European Investment Bank was founded; it was organized primarily to make loans principally to private enterprises and governmental agencies within the EEC, although it could finance enterprises outside the EEC.

Capital markets: 1945-68: The U.S. was the world's major capital market. In Europe, there were attempts to stimulate capital markets, but by 1967 there was still not complete freedom of capital movement. 1958-59 ff.: There developed in Europe a "Eurodollar market"—a market for lending and borrowing the world's key convertible currencies, mainly dollars, but other currencies as well. 1967:

The Eurodollar market was one of the world's largest markets for short-term funds. 1951-61: The Tokyo Dow Jones average rose from 100 to over 1,800 points. The Japanese stock exchange aided in creating a capital market in that country; for the 1st time in the postwar years, securities of major industrial companies were publicly traded. Trading per day on the Tokyo Exchange rose from an average 2.5 m. shares in 1951 to 100 m. shares in 1961. 1961-65: Decline of Tokyo Dow Jones—from a high of 1,829 to a low of 1,020. 1965-67: sweeping changes in Japan, as the exchange sought to regain public confidence.

FOREIGN TRADE. 1945: After the war, world trade was disrupted. Everywhere there were restrictions on commerce. 1946: Despite the restrictions, U.S. trade boomed; exports were 90% over their 1938 level and imports about 40% over the 1938 level. By contrast, exports of European countries (leaving Germany aside) were about 60% of their prewar (1938) level; German exports were negligible. Financed by loans and grants from abroad, European imports were 80% of their prewar level. Japanese exports were small; Japanese imports were higher than exports. 1947-48: U.S. continued to have large export surpluses; other industrial countries had difficulty exporting because of war devastation; they had difficulty paying for imports because of low exports. 1948: Customs union became effective between the Netherlands, Luxembourg, and Belgium as these nations abolished tariffs among one another and established a common external tariff. 1949: With the devaluation of the pound and other currencies, European exports became more competitive and foreign trade mounted. 1957: Treaty of Rome and formation of European Economic Community, 1 Jan., 1958; the EEC sought to remove all trade restrictions among the member nations (France, West Germany, Italy, Holland, Belgium, and Luxembourg) and to establish a common external tariff; 1968, 1 July: removal of internal tariff barriers and establishment of a common external tariff. 1959, 20 Nov.: Formation of the European Free

Trade Association (EFTA), including Britain, Sweden, Norway, Denmark, Switzerland, Austria, and Portugal. EFTA sought to remove quotas and tariffs among the 7 members, but did not seek to develop a common external tariff. 1967, 1 Jan.: EFTA achieved free trade in manufactured products among its 7 members. 1959 ff.: While no single country in the EEC had a larger foreign trade than the U.S., together they did. So too, the EFTA countries together had larger trade than the U.S. 1960's: The U.S. remained the largest single trading nation; West Germany replaced Britain as 2nd largest. 1962, 4 Oct.: Trade Expansion Act in U.S. committed the U.S. to freer trade worldwide; the U.S. President was given the authority to negotiate tariff reductions. 1961 ff.: Subsequent discussion, known as "Kennedy Round" negotiations, served to lower tariff barriers. 1967: Rise of protectionist sentiment in the U.S., which represented a reversal of entire postwar trend, yet during 1967 this sentiment was not translated into legislation. 1968: Despite the end of tariff barriers in the EEC, France undertook protective measures to safeguard the franc.

FOREIGN INVESTMENT. 1945-68: The U.S. became the world's major foreign investor. 1945: U.S. and Britain together controlled foreign assets of about \$29.5 billion. 1966: U.S. alone controlled foreign assets that had a book value of about \$111.9 billion. 1945-67: Rapid growth of American business enterprises abroad, especially in Europe. In many major European industries (automobiles, chemicals, oil, computers, etc.), American companies had a crucial role.

FOREIGN AID. 1945, June-1950, June: U.S. foreign aid exceeded \$28 billion; included in this total were aid under United Nations Relief and Rehabilitation Administration and its successor programs (about \$3.5 billion); aid to civilians furnished by the armed services in occupied countries, mainly Germany and Japan (\$5.3 billion); surplus property credits and other credits for reconstruction, recovery, and development (over \$10 billion, including the British loan of

\$3.75 billion in 1946); and the European Recovery Program, exclusive of program credits (\$7 billion). 1947, 12 Mar.: President Truman appeared before the U.S. Congress and urged that "it must be the policy of the U.S. to support free peoples who are resisting attempted subjugation by armed minorities or outside pressures" — a policy of containment to prevent Communist aggression against non-Communist states (the Truman Doctrine); 15 May: Passage of Greek-Turkish aid program by the U.S. to assure those countries' peaceful development "free from coercion." 5 June: In a speech at Harvard, U.S. Secretary of State George C. Marshall proposed a European Recovery Program, the "Marshall Plan." 17 Dec.: Adoption in U.S. of an emergency Foreign Aid Act. 1948, 3 Apr.: Economic Co-operation Act

in U.S. created the Economic Co-operation Administration (ECA) to develop plans for European economic recovery; subsequent to the passage of the act, 16 European nations formed the Organization of European Economic Co-operation (OEEC) to co-operate with the ECA in developing programs to benefit Western Europe. 1949, 20 Jan.: "Point 4 Program": President Truman in his inaugural address declared, "We must embark on a bold new program for making the benefits of our scientific advances and industrial progress available for the improvement and growth of underdeveloped areas" (Point 4 of the speech). 6 Oct.: Mutual Defense Assistance Act authorized the President of the U.S. to grant military assistance in the form of equipment, materials, and services to nations participating in the North Atlantic Treaty Organization. 1950, 5 June: Act for International Development incorporated Truman's Point 4 Program and represented an important shift in American aid programs from Europe to less developed countries. 25 June: Start of Korean War; foreign aid became increasingly an instrument of defense. 1951, 10 Oct.: Mutual Security Act consolidated most of the current U.S. aid programs into 1 mutual security program; the ECA became the Mutual Security Administration (MSA). 1953, 1 Aug.: Establishment in the U.S. of the Foreign Operations Administration to replace MSA and to handle the aid programs. 1955, 30 June: International Co-operation Administration took over the functions of the FOA; the ICA's main thrust was toward technical assistance, although it did allocate certain aid funds. 1961, 13 Mar.: President Kennedy called for an Alliance for Progress, which committed the U.S. to massive social and economic aid to Latin America. 4 Sept.: Act for International Development in the U.S. created a new Agency for International Development (AID) to co-ordinate the U.S. aid programs. U.S. aid programs were the most extensive in the world (1945, 1 July–1966, 31 Dec.: U.S. net foreign aid totaled \$106.9 billion). Other industrial countries saw their responsibility to or their political advantage in

foreign aid programs. 1949, 25 Jan.: In response to the establishment of the OEEC, there was—under Soviet influence—the formation of the Council of Mutual Economic Assistance (COMECON); it included the USSR, Poland, Czechoslovakia, Bulgaria, Hungary, and Rumania (East Germany and Albania joined later; 1962: Albania dropped out; Mongolia was added; 1964, Sept.: Yugoslavia was made an affiliate); COMECON sought to assist socialist planning, commerce, and economic development within, and then outside, Eastern Europe. 1961, 30 Sept.: OEEC was officially replaced by the new Organization for Economic Co-operation and Development (the OECD); the members of the OECD included the former members of the OEEC, plus the U.S. and Canada; Yugoslavia and Finland became involved in certain of its activities (1964: Japan became a member); the OECD sought to aid economic growth of its member nations and of less developed countries; within the OECD was the Development Assistance Committee (formed as the Development Assistance Group in 1960 and incorporated into the OECD in 1961); the DAC aimed to co-ordinate and improve bilateral aid programs of its members. 1950's and 1960's: European nations (in Western and Eastern Europe) and Japan were involved in bilateral foreign aid to less developed countries. Foreign aid also went through various multilateral channels. Foreign aid consisted not only of capital exports but of the export of managers, skills, and technological "know-how."

BUSINESS ORGANIZATION. Significant changes in business organization occurred in every industrial nation.

U.S.A.: 1945–68: As business enterprises in the U.S. grew larger, they tended to diversify their activities; late 1950's and 1960's: a new type of American corporate enterprise came into being, the so-called "conglomerate"; a conglomerate was a corporate enterprise with no major product line or industrial specialty; no single industry produced over 50% of its revenues; instead, the conglomerate's output might include a range of products, from ships to typewriters. U.S. antitrust legisla-

tion, which served to bar large enterprises from expanding in the same line through acquisition, initially did not pose an obstacle to the new conglomerate. Likewise, large American corporations became increasingly "multinational"; they expanded their operations worldwide (except in the Communist countries). Many large American corporations became oriented toward research and development to a greater extent than ever before. For the 1st time in U.S. peacetime history, the federal government became a major customer of American business; the U.S. government underwrote a considerable part of the massive investment in research and development by American corporations. As corporations grew in size, diversified their business activities, expanded overseas, entered into new research projects, and developed new relationships with the U.S. government,

significant changes took place in the management of these large enterprises. Management became professionalized. Businessmen increasingly took professional training courses in management methods. During World War II, the field of "operations research," as applied to military logistics, developed; 1950's and 1960's: operations research was used to handle business problems; mathematical and statistical techniques were applied to business analysis. Likewise, during World War II, again related to military needs, new techniques of financial analysis were developed which had peacetime business applications. 1960's: Use of computers by American business created a revolution in data gathering and analysis. Routine clerical tasks, such as payrolls, were easily handled by a computer. Information could be stored in computers and retrieved in seconds, using techniques of linear programming, the computer could solve certain limited business problems; the consequences of other business decisions could be simulated on the computer. American businesses became "systems-oriented"; i.e., they sought to prepare complete, integrated systems of control of production, inventories, finance, marketing, etc. The "systems approach" involved rigorous analysis of "cost-effectiveness," generally utilizing the computer to digest masses of information and often to simulate the consequences of individual decisions.

Western Europe: In Western Europe the changes in business management were different and less dramatic. 1945 ff.: After the war, the occupation forces in Germany sought to break up the giant cartels. I. G. Farbenindustrie—the largest German combine—with interests in 400 cos. in Germany and 500 foreign enterprises, was the key combine under attack; 1952-53: I. G. Farbenindustrie was divided into 3 separate major groups: the Badische Aniline und Soda Fabrik, the Bayer Werke, and the Hoechst Werke; these became Germany's 3 leading chemical cos. In many parts of Europe, government ownership of key enterprises became common. 1950's and 1960's: European business growth tended to involve in-

creases in scale in the same industry, although British enterprises undertook some of the diversification that American cos. were experiencing. 1957, 25 Mar.: The Treaty of Rome, establishing the Common Market, contained antitrust provisions, designed to avoid cartelization, but the idea of antitrust did not have deep roots. 1960-68: The tendency in Europe was away from strong antitrust policies. To meet American competition, European business hoped to grow in size and Europeans tended to encourage rather than to discourage mergers. There was a realization throughout Western Europe that the professionalization of American management gave American cos. a competitive advantage in European markets. Within Europe there was a proliferation of management training programs and an awakened concern for the techniques of management; there came to be a recognition that increases in productivity (output per resource input) came not only from technological change but also from effective management. In Britain, especially, the nation's loss of competitive advantage was blamed on poor management. Major British cos. employed American management consultants. On the Continent, Europeans sought to close the "management gap"—the gap between American and European management methods.

Soviet Union: 1945-68: The means of production in the Soviet Union remained government-owned, but there came to be a separation of ownership and management; a managerial group developed, which ran the state-owned enterprises. 1945: The Soviet Union continued to seek central planning of the entire economy. 1950's and 1960's: USSR began to realize that decentralization of decision-making would lead to more efficient use of resources. Late 1950's and 1960's: Still committed to government ownership and to over-all central planning, the Russians began to make concessions to the market system in running state-owned enterprises. They recognized that the use of money was a good measure of performance (and even considered the use of "profits" as a means of measuring the relationship of

inputs to outputs). They introduced economic incentives, which related managerial compensations to increases in productivity. They even began to recognize a need for measuring the cost of money. Writers on the Soviet economy began to talk of a "convergence" in business organization between capitalist and socialist systems: both systems had increasing separation of ownership and control; both developed managerial elites; both had enterprises that seemed to require similar talents for administration; by the mid-1960's the USSR had begun to use techniques similar to those used in the U.S. to measure performance; the USSR, however, was far behind the U.S. in developing "professional management" methods. In Eastern Europe, late 1950's and 1960's, Yugoslavia developed a high degree of decentralization in production, investment decisions, and pricing; it led in this respect in Eastern Europe.

Japan: 1945-47: Under the Supreme Commander of the Allied Powers (SCAP) there was the so called "*zaibatsu*-busting." 83 *zaibatsu* holding companies were dissolved and were required to sell their stock in the individual companies forming the *zaibatsu* to the general public on the open market. Large fortunes of leading families were confiscated by a capital levy. 1947, 10 Dec.: Law to provide for "deconcentration" of 1,200 Japanese companies; it was not implemented. 1948, Dec.: The *zaibatsu*-busting activities of SCAP tapered off. 1950's and 1960's: Re-formation of the *zaibatsu* in Japan, but on a different basis; no longer were there key families owning these huge organizations. Large *zaibatsu* enterprises, linked by interlocking directorates, were highly diversified units, in a wide variety of industries; 1960's: government policy in Japan was to encourage concentration and amalgamation of enterprises and to avoid "undue competition." Yet at the same time, small business in Japan flourished. The ownership of publicly held securities in businesses became widespread. In Japan there was interest in American management techniques and receptivity to American technology; Japanese management did not rigidly

follow American management practices; instead, in many important respects, Japan developed distinctive managerial structures. As for American technology, Japan welcomed it and modified it in a creative fashion.

GOVERNMENT POLICY. Economic role of the state: In every industrial nation, the role of government assumed new significance. In market economies (U.S., Western Europe, and Japan), governments utilized monetary and fiscal policies to promote economic development. In the USSR economic planning continued; in Eastern Europe it began. 1945: The Labour Party took office in Britain, the tone was set for government intervention. 1945-46: France prepared its 1st plan for modernization and equipment. 1946, 20 Feb.: Employment Act adopted in the U.S.; it has been called the "Magna Carta of government interventionism"; the act established the Council of Economic Advisers to prepare "national economic policies to foster and promote free competitive enterprise, to avoid economic fluctuation, and to maintain employment, production, and purchasing power." 1946: Netherlands introduced its 1st Central Economic Plan. Russia adopted its 4th 5-Year Plan, seeking to reconstruct war damages and with an emphasis on industrial development. 1947: Monnet Plan (1947-51, extended to 1953), in France, put emphasis on the development of coal mining, electric power, ferrous metals, cement, agricultural machinery, and domestic transportation; this was the start of so-called "indicative" planning in France—i.e., planning where goals were formulated and government aids for achieving these goals were provided, but there was no direct control over private firms. 1947, late, and 1948: Occupation forces in Germany and Japan took steps to rebuild these devastated countries. 1948 ff.: Under the Marshall Plan each participating nation was required to prepare 4-year and annual plans. Eastern Europe, under Russian influence, began to plan after the Soviet model. 1951: 5th Russian 5-Year Plan was for the 1st time concerned with consumer goods. 1955: Introduction of the Vanoni 10-Year Plan

for Italian economic development; 23 Dec.: Japanese cabinet approved a 5-Year Plan for 1956-60. 1956: 6th Russian 5-Year Plan—in fact, a 7-year plan, emphasizing agriculture, housing, and industry. 1961-68: Using fiscal and monetary policies, along with wage-price guidelines, the U.S. government took steps to promote economic growth; President Kennedy's "New Frontier" and President Johnson's "Great Society" programs demonstrated an enlarged government role. 1966: 8th Russian plan, a 5-Year Plan; the plan put new emphasis on decentralization of industry.

Extension of government ownership:

1945: The wave of nationalizations begun in France in 1944 continued. May: Nationalization of Société des Moteurs Gnome et Rhône. June: Provisional nationalization of Air France. Nov. ff.: The French Constituent Assembly formed after the elections undertook to nationalize (1) the Bank of France and the 4 largest credit institutions, (2) gas and electricity, (3) 34 insurance companies (between 50% and 62% of the total insurance activity), and (4) the remainder of the coal-mining industry (May 1946: Charbonnages de France established as a national corporation to administer the nationalized coal industry). 1945, 19 Dec.: Final passage in Britain of the Bank of England Act (effective 1 Mar., 1946, the Bank of England was nationalized); Dec.: British government introduced the Coal Industry Nationalisation Bill (passed in July 1946, 1 Jan., 1947: the new National Coal Board assumed control over the British coal mines). 1946, 17 Apr.: British government announced it intended to introduce legislation to nationalize the steel industry. (Nov. 1948: A Steel Bill was introduced; 24 Nov., 1949: Steel Bill passed, under its provisions the government-owned Iron and Steel Corp. took over 107 major British steel companies.) Nov.: British government introduced measures to nationalize the railroads, highway freight transportation, canals, and London Transport, which were adopted and became effective 1 Jan., 1948. Dec. 1946: British government introduced

a bill to nationalize the electrical utility system in its entirety (13 Aug., 1947: passage of the Electricity (Supply) Act, which nationalized the British electrical utility system, effective 1 Apr., 1948). 1948, Mar.: The French nationalized the Paris transport network. 1948: French government reorganized 2 maritime shipping cos. (Compagnie Générale Transatlantique and Compagnie des Messageries Maritimes), keeping the pattern of mixed ownership; new statutes for Air France changed the ownership pattern from 100% state to mixed ownership. The British Parliament passed an act nationalizing the gas industry (effective 1 May, 1949). 1953: Iron and Steel Act in Britain returned the steel industry to private enterprise; under the Tory government long-distance road transport was also denationalized and the publicly owned railroads were reorganized. Establishment in Italy of Ente Nazionale Idrocarburi (ENI)—a government-owned oil co.; ENI's operations under Enrico Mattei (1906–62) came to be broad in scope and to cover atomic energy as well as petroleum and chemicals; the Italian government-owned IRI continued to expand throughout the postwar years. 1962: Electric power industry nationalized in Italy. 1967, 22 Mar.: British Parliament passed the Steel Nationalization Bill; the 14 major producers were nationalized; 200 small firms were left under private ownership; 28 July: British government took over ownership of 90% of the British steelmaking capacity; the 14 major steel cos. were consolidated into the new British Steel Corp., the largest industrial enterprise in Britain.

Status of government ownership: 1968: In France the government was involved in electric power, gas, coal, atomic energy, motor-car production, banking, railroads, airlines, some shipping lines, radio, television, telegraph, telephone, city transport, and tobacco, plus parts of the insurance, aircraft, armaments, and petroleum industries; the French state was a shareholder in some 500 industrial and commercial enterprises. In Britain, the state was involved in banking, electric power, coal, gas, atomic energy, steel,

railroads, airlines, radio broadcasting, telephone and telegraph, and part of the television industry; the government had investments in petroleum. In Italy, the government participated in a wide range of industries and owned electric power, railways, and telephones; certain enterprises in Italy were joint ventures between the government and private enterprise. In the Soviet Union, all basic industry, transportation, communications, and banking were government-owned. The Australian government was involved in railroads, airlines, coastal shipping, and electricity supply (the state governments). The German government was not importantly involved in business, with the exception of the railroads, telephones, and some industrial enterprise, the most important being mining. The Japanese government owned the railroads, radio broadcasting, television broadcasting, telephones and telegraph, and the airlines; it was involved in banking, yet basic industry was in the private sector (the

public sector in Japan was smaller than it had been before World War II). In the U.S. and Canada there was not widespread government ownership; in the U.S., the government, through agencies such as the Atomic Energy Commission and through NASA, was directly involved in business activity. In Canada certain railroads were publicly owned, and there

were some other concessions to public ownership in utilities, but here too basic industry remained in the private sector.

Defense spending: In the U.S. especially, but also elsewhere in the industrial world, defense spending represented a substantial portion of government expenditures. U.S. government expenditures provided a spur to industry.

The Developing Countries^{*}

AGRICULTURE. 1945-68: Although the agricultural sector continued to represent a substantial portion of the gross domestic product in most developing countries, here as in the industrial nations the percentage of agriculture to GDP (with a few exceptions) declined. Argentina, Brazil, Bulgaria, India, Indonesia, Jordan, and Rumania number among the exceptions; in these countries the contribution of agriculture either rose or remained constant.

In less developed countries a large percentage of the population continued to be involved in agriculture, but as industry developed their proportion declined. As population rose in less developed countries, the latter sought to keep food pro-

duction rising as fast or faster than the population. The record shows that food production had difficulty keeping pace with rising population.

Much of agriculture in the less developed world remained on a subsistence level. Small plots peripheral to the market economy continued in India, Pakistan, and much of tropical Africa. (1954: Estimated 65-75% of the total cultivated land and 60% of the total adult male labor force in tropical Africa were involved in subsistence agriculture, 1968: most Africans still got their livelihood in this way, although the tendency was toward increasing commercialization of agriculture.) In less developed countries peasants intermingled cash crops with

^a The structural change that took place in Communist China is better demonstrated by figures given in T. C. Liu and K. C. Yeh, *The Economy of the Chinese Mainland*, Princeton, 1965, p. 66. Their figures are: 1952: agriculture represented 47.9% of net domestic product; 1959: agriculture represented 29.9% of net domestic product.

their subsistence crops; this became the tendency in Africa. There were also peasant export economies specializing in cash export crops; for example, in Burma

and Thailand (based on rice) and Ghana (based on cocoa). Often when export cash crops replaced subsistence crops, there was a decline in food production

^a Excluding Mainland China.

for domestic consumption. All these 3 types of peasant agriculture created limits on the rise of agricultural output per capita (because there was no change in traditional methods of cultivation). As urban areas and population expanded, and as peasants moved into producing cash crops for export, a number of countries found they could no longer support their food needs, moreover, famines and starvation once accepted in less developed countries were no longer tolerable by modern standards. Thus many less developed countries became importers of foodstuffs. This was true in parts of Africa, India, in times of natural disasters, became a food importer; Mainland China, 1961-62, became a large importer of wheat; because of large estates and inefficient use of land in Chile, that nation, once self sufficient in foodstuffs, became a regular net importer of food. Plantation agriculture, which was efficient, continued to concentrate on export. With the exception of sugar, there were few plantations growing basic foodstuffs (cereals, rice, potatoes, breadfruit, etc.)

Plantations: 1945-68: Decline of plantation agriculture. In some areas large plantations founded in the past persisted, but few new plantations were established. In Central America, United Fruit moved in the direction of purchasing bananas from small indigenous farmers rather than growing them. In South Vietnam, where the French had had large rice plantations, in 1954-58 the South Vietnamese government purchased the plantations. In Indonesia, 1957, the giant Dutch plantations were expropriated. 1947 ff.: The policies of Asian and African governments favored the small

holders. 1959-60: Nationalization of the large American sugar plantations in Cuba.

Scientific agriculture and mechanization: 1945 ff: Exhaustion of soil through long use of the land accentuated the difficulties of raising agricultural output in less developed countries, especially in East Asia. In Africa improper use of the land through overgrazing, destruction of growths by fire, overcropping, and poor rotation techniques destroyed land resources. In most of the less developed world, there was an attempt to introduce chemical fertilizers, irrigation, and flood control. 1950's and 1960's: In Communist China, new use was made of electric energy in pumping stations to drain farmlands in time of flood and to irrigate in times of drought (1952-65, est. increase in application of electricity in Mainland China for this purpose 43 m. kwh to 2,500 m. kwh). Mechanization of agriculture in most less developed countries proceeded slowly. Granting technical assistance to developing countries were the Food and Agriculture Organization, ECAFE (Economic Commission for Asia and the Far East), the World Bank, and the International Development Corp. (a World Bank affiliate). Likewise, new regional and national development banks provided capital for transforming agriculture.

Agrarian reform: Many less developed countries took steps toward agrarian reform. Land reform followed 2 paths with respect to the size of the unit under cultivation: (1) the breakup of large estates in the hope of getting more land into production and in the interest of "justice" (this included massive redistribution of land) and (2) the consolidation of small

plots into large holdings in the hope of making agriculture more efficient. In addition, land reform involved changes in ownership and land tenure toward (1) more widespread ownership of land, (2) eliminating absentee landlords and protecting tenants and small farmers, (3) freeing small holdings from feudal arrangements, (4) collectivization or socialization of ownership, and/or (5) desocialization of agriculture. Such land reforms were endemic in underdeveloped countries, with certain exceptions. (Most of tropical Africa, Laos, and Cambodia represent exceptions; in these areas, small landholdings predominated, and there was as yet no pressure of overpopulation.) 1945: 1st Agrarian Law was passed in Venezuela (1945-48: 1.17 m. acres distributed to 7,000 families); May: Turkish Land Reform granted small plots to peasants (1950, Dec.: About 1.3-1.4 m. acres had been distributed to the peasants under the Land Reform Act in Turkey; nonetheless, many large estates remained). 1945-49: Socialization of agriculture in Eastern Europe after the Communist governments took over. 1947 ff.: Land reform started in India. (1945: 43% of India's cultivated land was under a zamindari-type system; 1956: only 8.5% was under this system. Land-reform laws in India varied from state to state; in general, the tendency was toward more fragmentation in ownership, which was counteracted by government-sponsored co-operatives to supply to peasant farmers credit, fertilizers, marketing assistance, etc.; 1965: 200,000 co-operatives in India.) 1948: Uruguay organized the National Land Settlement Institute; it sought to buy and redistribute land; lack of funds and other difficulties made its success minimal. Oct.: Land Nationalization Act passed in Burma; under it the government obtained title to all land owned by absentee landlords; the land was to be redistributed among the landless peasants. 1949, June: Land Reform Law in South Korea provided for government purchases of land from landlords and redistribution of the land among tenant farmers. 1950: Agrarian reorganization on the Chinese mainland followed the Com-

munist take-over; an agrarian law authorized confiscation from landlords and rich peasants of almost $\frac{1}{3}$ of the cultivated land of the country; the land was redistributed to the poorer peasants, confirming the system of private ownership; Oct.: seizure of all privately owned land in North Korea, and distribution of the land to small farmers (title remained in the hands of the government). 1950-54: Experiments were made on the Chinese mainland with mutual-aid teams, which worked to cultivate the land (by 1954, over $\frac{1}{2}$ the farm households in the nation were involved). Land reform in the Philippines undertaken; peasants who renounced the Hukbalahap were granted landholdings by the government. 1952: Agrarian Law in Guatemala made idle farmlands over 667 acres subject to expropriation and distribution to landless farm workers (1954: Revolution in Guatemala slowed the land-reform activities). Sept.: Egyptian Land Reform sought to improve the position of the small farmer and tenant, large landholdings were confiscated. 1952-53: Desocialization of agriculture in Yugoslavia (although Yugoslavia claimed long-run commitment to socialized agriculture). 1953: Law in Formosa expropriated large estates, involving about 71% of the island's land surface; successful land redistribution followed. Sept.: Agrarian Reform Law in Bolivia provided for extensive land redistribution, settlement of new areas, and improvement in tenancy relations; large haciendas (including $\frac{3}{4}$ of the nation's crop land) were expropriated; these were divided among small farmers (1952: 50,000 landowners in Bolivia; 1956: 800,000). 1954: Consolidation of mutual-aid teams in China into agricultural co-operatives. 1955-57: Small farm co-operatives in China were merged into large collective farms (by 1957 collectives involved almost all the farms in China); in the collective, manpower was organized into production brigades. 1956: Poland and Hungary desocialized agriculture. (Hungary soon reversed the pattern and resocialized agriculture; Poland did not, although the country remained committed in word to socialized

agriculture.) 1958: Introduction of the commune in China, a combination of the large collectives, but with broader functions; the commune assumed local government powers, promoted village manufacture, and sought to communalize the life of its members (1958, Oct.: 98% of all peasant households in China were involved in the 26,500 communes); the communes entirely eliminated private property. (1958, Dec.-1959, Aug.: The commune in China became a loose federation of collectives; the "brigade"—equivalent in size to the old collective farm—directed economic activity; many pre-commune forms began to reappear.) 1958 ff.: Under Ayub Khan in Pakistan attempts were made at land redistribution. 1959: After Syria joined with Egypt in the United Arab Republic, 1 Feb., 1958, Syria followed the Egyptian pattern of land reform, breaking up the large estates and redistributing land (after Syria broke away from the UAR, Sept. 1961, the land-reform movement still continued). Iraqi Land Reform involved the dissolution of the large landed estates and redistribution of land. Cuban Land Reform Act sought to break up large estates and to expropriate foreign-held land; in Cuba former owners were permitted to retain a minimum amount of property, each peasant family was to receive 66.6 acres; 1959-60: wholesale expropriation of sugar, tobacco, and cattle lands in Cuba; instead of peasants receiving land, they were drafted to work on large co-operative agricultural enterprises. 1960: Venezuela passed Agrarian Reform Law, aiming to improve the pattern of land tenure and rural living conditions. Iran passed a law restricting private landholdings (the actual large-scale land reform was carried out in Iran in 1963). 1961: As a result of the decline in agriculture, Mainland China revised its system, private plots (aggregating about 5% of the collectively owned land) were returned to peasants, in the commune, production brigades owned the land, while at sub-level production teams directed work. Colombia adopted Social Agrarian Reform Law, which established Colombian Agrarian Reform Institute (INCORA);

the aim in Colombia was to redistribute land to small farmers; INCORA could purchase, expropriate, or cancel ownership of land not worked productively for 40 years. Costa Rica approved Land Settlement Law to give permanent title to squatters, legalize occupancy, and settle idle agricultural land. 1962: Chile passed its 1st agrarian reform law; the government was empowered to expropriate and subdivide large holdings. (1963: Constitutional amendment in Chile authorized the government to pay compensation for expropriated land in installments; 1965: new agrarian reform law submitted to Chilean National Assembly; 1967, July: after 2 years of delay, the Chilean Agrarian Reform Bill became law; the act called for the redistribution of about 15 m. acres of previously privately held land.) Dominican Republic adopted Agrarian Reform Law; its aim was to consolidate small private holdings into more efficient operations; the problem in the Dominican Republic was fragmentation of land into postage-stamp plots; the government also began distribution of publicly held land Honduras enacted an Agrarian Reform Law which authorized expropriation (with compensation) of unproductive land and a progressive land tax to penalize private owners of unused farmland. Mainland China established "the production team" as the "basic accounting unit" in agriculture, ownership of most land continued to be vested in the production brigade; small private plots continued, but were peripheral to the system. 1963: Nicaragua passed a Land Reform Law, it was to create a more desirable pattern of land distribution and tenure. New land-reform measures introduced in the Philippines, protecting tenant farmers. 1964: Brazil amended its federal constitution to accord with the needs of its land-reform program; Brazilian land statute gave the federal government power to expropriate idle or underutilized farmland with compensation in cash for small holdings and in agrarian bonds for latifundia (large estates). Ecuador adopted Agrarian Reform and Colonization Law, which sought to limit land-ownership to economically productive

units and do away with absentee ownership and semifeudal forms of tenancy and labor; the law banned forced labor. Peru enacted Agrarian Reform Law; this eliminated so-called *feudatorios*—tenants, sharecroppers, and laborers who worked under arrangements similar to indentured labor; aim of the law was to increase agricultural output and productivity; land redistribution was planned; large inefficient private holdings were made subject to expropriation. Mainland China created new communes and acted to make the unit under cultivation smaller (1964: 74,000 communes). 1966: Land reform in North Vietnam—with redistribution of land to the peasants. 1966–67: Algeria took steps in the direction of agrarian reform; it nationalized large estates and redistributed land on a collective basis to landless Algerians. 1967, Nov.: South Vietnamese government committed itself to full-scale land reform.

Agricultural progress: 1945–68: Difficulties in the agricultural sector often held back industrialization. Nations that would have preferred to spend foreign exchange on imports of machinery had to spend it on food. Transforming traditional agriculture into efficient modern agriculture was one of the hardest problems faced by developing countries. The pattern was one of commercialization of agriculture.

RAW MATERIALS. Coal: The most dramatic development was that of Communist China's coal resources. 1960: Com-

munist China led the world in coal production (420 m. metric tons, compared with 392 m. in the U.S. and 374 m. metric tons in the USSR). 1961–65: Decline in Communist Chinese output, so that the nation dropped behind the U.S. and USSR in production; nonetheless Mainland China continued as a 1st-rank coal producer. 1945–68: Coal production in Latin America and in the developing countries in Africa continued to be small.

Oil: 1945–61: Venezuela ranked after the U.S. as the world's 2nd largest oil producer. (In 1961 it became the world's 3rd largest oil producer, following the U.S. and the USSR.) 1945 ff.: Oil reserves of the Middle East were tapped on a large scale. 1950's: Discovery that Africa, once considered to have little or no oil, had huge quantities of oil in Libya, Algeria, and Nigeria, and possibly elsewhere as well. New techniques for finding oil, along with new means of deep drilling and offshore drilling, served to raise oil reserves and output. Oil production in less developed countries was in large part for export.

SOURCE: United Nations, *Statistical Yearbook 1966*, except for 1965 Mainland China figure, which is an estimate in millions of tons given by W. P. Wang, "The Mineral Resource Base of Communist China," *An Economic Profile of Mainland China*, Washington, 1967, p. 174.

Natural gas: Natural-gas resources in less developed countries were in general not developed for export because of the transportation expense; natural gas was used to improve the output of existing oil wells, but frequently it was flared—that is, burned and wasted because it was not economical to utilize. Yet in oil-producing nations, where there were natural-gas deposits, attempts began to be made

to utilize the natural gas locally or to ship it in liquefied form.

Iron ore: The mining of iron ore in certain less developed countries accelerated or began on the basis of new discoveries. In Communist China, India, and Brazil, the iron ore was in large part used domestically, while iron ore in Venezuela and Liberia was in the main for export. 1960's: Iron-ore resources in many African countries were known to exist, and development was beginning.

1950's and 1960's: Development of bauxite resources in Africa; the largest enterprises were in Guinea. Ghana's bauxite resources were known, and development had started. Another mineral that provided important export revenues was tin from Malaysia, Bolivia, Thailand, Indonesia, and Nigeria.

Contribution of raw materials to economic development: 1945-68: The coal and iron-ore output of Communist China and India helped their national development. Other less developed countries began to employ their raw-material resources—once primarily for export—for domestic use. Raw materials that were extracted by foreign investors provided valuable sources of income for the Middle Eastern oil-producing nations, for Venezuela, and for Chile. 1948: Petroleum Agreement in Venezuela resulted in the establishment of the concept of a 50-50 division of profits between the producers and the government as a basic principle. 1950's: The 50-50 principle spread to the oil-producing countries in the Middle East. 1950's and 1960's: Less developed countries began to get more than 50% of the profits from oil production. Revenues from oil particularly, but also from other minerals, provided capital for economic development.

ENERGY. 1945 ff.: Many underdeveloped lands still depended on humans and oxen, especially in Asia and Africa. Yet as countries developed, they increasingly utilized modern forms of energy.

Commercial sources of energy: (1) Fossil fuels. Some less developed countries went through the traditional Industrial Revolution pattern, using coal as the primary energy resource. Late 1950's and early 1960's: Coal represented by far the largest portion of primary energy used in Communist China—roughly 66% of the

fuel and power balance of the country (the rest being composed of brushwood, rice husks, dung, and other local non-commercial fuel); as for commercial energy in Mainland China, coal supplied over 90%. Other underdeveloped countries, which were producers of oil and natural gas, based their industrial revolutions on these raw materials rather than coal. (2) Use of the internal-combustion engine in less developed countries spread as automobile registrations increased. (3) Output of electrical energy rose rapidly.

ELECTRICAL ENERGY PRODUCTION BY REGION
(billion kwh)

	1948	1965
World	809.8	3,339.7
Africa	13.4	56.6
South America	17.9	73.2
Asia (excl. Japan)	23.2	132.9

1950's and 1960's: Recognition and some development of large hydroelectrical power potential in Asia and Africa. Some sites were, however, so remote that use of the power was not considered. Development of hydroelectric energy involved tremendous capital. When consumers were not present, development was not economical.

Nuclear energy: 1964, Oct.: Communist China exploded its 1st nuclear bomb; this indicated the potentials for harnessing nuclear energy. 1965: India made contracts for its 1st nuclear power station at Tarapur, near Bombay, and had 2 other proposed nuclear power projects; Pakistan made plans for nuclear power stations in Rooppur in East Pakistan and in Karachi in West Pakistan. The Philippines started an Atomic Research Center.

INDUSTRIES. Industrialization spread in Latin America; 1950-65: Latin American industry grew at an average annual rate of 5.6%. 1955-65: Share of light industry in total production in Latin America decreased from 60% to 51%, while that of heavy industry increased from 40% to 49%. Industrialization in Latin America occurred in large part as a result of government policies of import substitution. Often small high-cost industrial plants were built to serve national markets; the high production costs made most of Latin American industry uncompetitive in world markets. In less developed countries in Asia, industrialization took diverse patterns. Countries such

SOURCE: United Nations, *Statistical Yearbook 1964*, and Chase Manhattan Bank, *World Business*

as India, Mainland China, North Korea and North Vietnam, where the government role was impressive, emphasized heavy industry—metal and machine building—in order to produce capital equipment to encourage economic growth. On the other hand, Pakistan and China (Taiwan) stressed consumer and intermediate goods; they expected later to move into heavy industry. Malaysia, Singapore, and Hong Kong tended to concentrate on light industry. 1960's: Recognition throughout Asia that nations ought to be self-sufficient in such industries as textiles, steel (in many countries), chemical fertilizers, cement, and petroleum. 1945-68: For developing nations in Asia as a whole there was a shift of emphasis from light to heavy industry; import substitution became the general policy. 1950's and 1960's: Industry in tropical Africa remained rudimentary, though countries began to do more processing of domestic raw materials. Assisted by foreign technical aid and foreign investment, new industries began in tropical Africa. Economists debated whether in their growth less developed countries, which had abundant labor and little capital, should use labor-intensive rather than capital-intensive methods; while economists argued, less developed countries tended in new industries to adopt the most sophisticated technological methods—borrowed from the industrial nations.

Textiles: 1945-68: Most less developed countries had textile industries, ranging from handicraft industries to machine manufacture. Among the less developed countries, Communist China surged ahead in the cotton textile industry. 1965: China had 130,000 automatic looms (compared with 96,000 in Japan and 28,000 in India; the U.S. had 285,000, the USSR 182,000, and Britain 47,000); 1960: cotton-yarn production in Communist China (1.6 m. metric tons) was 2nd only to the U.S. (1.8 m. metric tons). Some less developed countries, India, for example, had old-fashioned machinery in their textile industries; the industries were already "mature." Other countries were still seeking self-sufficiency in cotton textiles

(Burma, Ceylon, Indonesia, Cambodia, and Malaysia, for example). African nations remained large importers of textiles. 1950's and 1960's: A number of less developed countries undertook output of synthetic fabrics (India, Communist China, Brazil, Argentina, for example).

Steel: Substantial steel industries existed in only a few developing countries.

^a Bureau of Mines estimate; Emery in the *Asian Survey*, June 1966, estimated Communist China's steel production at 10 m. metric tons, while the *Far Eastern Economic Review*, Mar. 31, 1966, p. 623, estimated China's production at 12 m. metric tons.

^b Ingots only.

^c Excluding alloy steels.

1965: The spread of steel production was evident in that less developed countries with steel production between 500,000 and 1 m. metric tons included Venezuela, Bulgaria, and Turkey; those with production between 500,000 and 200,000 metric tons included Chile, Portugal, China (Taiwan), Greece, and Colombia; those with production under 200,000 metric tons included Egypt, Rhodesia, Israel, South Korea, Peru, Pakistan, Uruguay, and Thailand. Other nations starting new steel industries were Burma, Ceylon, Indonesia, Malaysia, the Philippines, and Iran. 1965: Communist China began to produce steel tubing for oil-drilling equipment, high-silicon steel rails, and alloy-steel plates for making chemi-

cal fertilizer and power generation equipment. Machine tool and equipment industries developed in countries that had steel industries.

Automobiles: Late 1950's: 1st automobile manufacturing in Latin America; 1968: Brazil, Argentina, and Mexico had significant automobile manufacturing industries. India had some motor vehicle production (not on a large scale).

Petroleum refining: 1945-68: Less developed countries with oil production built petroleum refineries; this was not new; the key innovation was the proliferation of refineries based on imported crude oil. New refineries were built in India, China (Taiwan), South Korea, Malaysia, Pakistan, the Philippines, Singapore, Thailand, Rhodesia, Kenya, and Senegal, for example.

Chemicals: In Latin America and Asia, chemical industries developed. Synthetic fabrics, chemical fertilizer plants, heavy chemicals, and pharmaceuticals were among the new industries of the 1950's and 1960's. 1960's: Petrochemical complexes designed to utilize the by-products of petroleum refineries and to use otherwise wasted natural gas were developed in many less developed countries.

Electrical and electronics industries: Electrical-equipment industries proliferated. New activities started in Communist China, India, Brazil, Argentina, Mexico, and Chile. 1960's: Communist China had 2 large facilities to build electrical equipment, 1 in Manchuria (started by the Japanese in the 1930's and, 1953-60, expanded with aid from the USSR) and 1 near Shanghai (1952-55, built with Czech technical aid). In Hong Kong, China (Taiwan), the Philippines, and South Korea, electronics industries developed, turning out TV, radio, and phonograph components and sets, electronic memory units, semiconductors, and other products of the electronics industry. 1965: Reports from Communist China indicated that that nation was building large electronic microscopes and high-speed electronic digital computers.

Other industries: Processing of locally produced minerals in many less developed countries increased. 1956: Opening in Guinea of the 1st alumina plant in Africa

(based on locally available bauxite). 1965, Aug.: Opening in Thailand of that country's 1st tin smelter (although the nation had been a tin producer for centuries). New industries in Latin America, Asia, and Africa included, in many countries, cement, paper, and glass enterprises; the countries which had these industries before World War II expanded such industrial activities.

TRANSPORTATION. 1950's and 1960's: Less developed countries pre-

sented the paradox of using traditional means of transportation (human carriage, animals, etc.) but also the airplane. In practically every less developed country transportation facilities continued to be inadequate. Railroad traffic rose, but with few exceptions (Mainland China and certain African nations) there was little building of new track. Mainland China did build railroad lines into west China, seeking to unify the country; 1966: the entire railroad system of Communist China covered 22,000 miles. India modernized its railroads and made small extensions; India's railway system—the 4th in size in the world after the U.S., USSR, and Canada—equaled (1963-64) 34,500 mi.

Road and highway construction proceeded, though slowly. 1959, Mar.: Plans made and approved by the Economic Commission for Asia and the Far East for an Asian Highway. 1963, 16 Apr.: Pan-American Highway in Central America completed; the highway was at this point passable from Argentina (Tierra del Fuego) to Alaska (Fairbanks) except for a 450-mi. stretch in eastern Panama. For the transportation of oil, oil companies built pipe lines in less developed countries. Water transportation remained im-

portant in some nations, especially in Mainland China, where the length of inland waterways suitable for navigation was more than 55,000 mi. (compared with 5,000 mi. in India). 1945-68: Development of port facilities in West Africa and harbor improvements in East Africa.

Air travel: The true revolution was in air travel. Most less developed countries had airports, served by the international airlines; many less developed countries started their own airlines. 1960's: An expression of sovereignty in Africa was to have a national airline. The new accessibility of the less developed world, made possible by the jet airplane, was of vast importance in the process of economic development. The knowledge of the industrial world became more readily available in the developing nations.

COMMUNICATIONS. Not only the jet airplane but the appearance in less developed countries of movies, radios, and television demonstrated events in the outside world. Radios—especially after the introduction of the low-priced transistor set—gave illiterate peoples insights that the printed page could not give. 1950's: Introduction of television in major Latin American nations and to some extent in Asia. 1960's: From Congo (Brazzaville) to Ethiopia, from Gabon to Ghana, from

Kenya to Liberia, from Malaysia to Indonesia, and from Pakistan to Saudi Arabia, television spread. Such channels of communications gave millions of people access to modern ideas, which contributed to the breaking down of the traditional order.

FINANCE. 1945-68: Among the key innovations was the availability of large amounts of capital to less developed countries for the purpose of economic development. Capital came through bilateral foreign aid programs, through international agencies, and through private foreign investment; by using their power to tax, governments could obtain significant revenues for development—especially governments in the oil-producing states, which put levies on the foreign-oil producers. While rich individuals in poor countries built palaces and bought luxuries or dispatched their money abroad for deposit in Swiss banks, increasingly more effective efforts were made by the governments of less developed states to channel the newly available capital into use for development. Capital from foreign sources and from taxing foreign enterprises domiciled within less developed countries opened possibilities to the governments of those nations for planning and organizing their national development. Marketing Boards in Africa were often used to accumulate profits which could be put back into development schemes. 1960's: $\frac{1}{4}$ of the investments being made in less developed countries came from the resources of those countries; the $\frac{1}{4}$ from abroad, however, provided a necessary aid.

Banking: 1945-68: More banking facilities became available in less developed countries—some of them domestic and some foreign. Central banking and development banking institutions emerged. Banks were established to offer agricultural credits. Attempts were made to start savings banks, but in many less developed countries inflationary pressures militated against them. In West Africa traders who accumulated savings frequently did not deposit them in banks for fear of demonstrating their wealth to relatives, who would expect a share.

International banking institutions: 1945-68: Less developed countries could use international banking institutions to aid their economic development. 1959 ff.: Regional banking facilities were created to meet the needs of developing countries. 1958: Establishment of the European Development Fund to aid the dependencies of European states associated with the European Economic Community. 1959, Dec.: Establishment of the Inter-American Development Bank, to aid in financing development in Latin America; all members of the Organization of American States subscribed (1 Oct., 1960: the Bank started operations; 1961, 1st loans were made by the Inter-American Development Bank). 1960, 13 Dec.: The treaty establishing the Central American Common Market provided for the organization of a Central American Bank for Economic Integration to promote growth within the region. 1964, 1 Jan.: International Bank for Economic Co-operation started operations in Eastern Europe; it was modeled on the European Payments Union; Aug.: the African Development Bank came into existence (1 July, 1966: the African Development Bank started to do business from its headquarters in Abidjan, Ivory Coast); the capital of the African Development Bank was subscribed by some 31 African governments. 1965, 4 Dec.: Agreement signed in Manila under the auspices of the Economic Commission for Asian Development Bank. 1966, 22 Aug.: Asian Development Bank officially came into existence. 24-26 Nov.: Inaugural meeting of the Asian Development Bank held in Tokyo, member countries at this time totaled 30 (18 within and 12 outside Asia); 19 Dec.: the Bank officially started operations. 1967, 6 June: The Kampala Treaty included provisions for an East African Development Bank. Oct.: Arab economic ministers meeting in Algiers approved the text of an agreement establishing an Arab Development Fund.

Interest rates: For moneys locally available, interest rates in less developed countries tended to be high. Where inflation existed, such as in most of Latin America, exorbitant interest rates held

back development. In many countries—especially in Asia and Africa and to a lesser extent Latin America—there existed a financial dualism; on the one hand there were the new modern banking institutions serving the modern sector of the economy, and on the other hand the rural economy still had the old moneylenders who practiced usury. Peasants borrowed from local lenders (village moneylenders, landlords, shopkeepers, etc.) at steep interest rates.

Stock exchanges: Throughout Latin America—in Argentina, Brazil, Chile, Mexico, and Venezuela, for example—large cities had stock exchanges. The number of securities traded rose, yet the volume was small compared with industrial nations. 1956: Securities (Contracts) Regulation Act in India recognized 7 Indian stock exchanges and was India's 1st attempt since independence to control stock-exchange activities. Stock exchanges that emerged in less developed countries served the same function as they had in the key industrial nations. Major development of stock-market activities in less developed countries was, however, for the most part still in the future.

FOREIGN TRADE. 1948-65: Foreign trade of less developed countries grew, but on the whole the growth did not keep pace with the expansion of world trade, which rose over 3-fold.

Exports: 1945-68: Underdeveloped countries depended as in the past on exports of primary commodities. Some of their exports were challenged by synthetics during World War II. In many uses synthetic rubber replaced natural rubber; synthetic preparations substituted for cotton; paper bags were used instead of jute. Synthetic nitrates (perfected during World War I) almost completely replaced natural nitrates; chicle was no longer required in chewing gum; synthetics took the place of the castor bean in castor oil. Thus countries that had exported these raw materials had to substitute other exports, if possible. Likewise, as industrial nations grew more prosperous, the amount of money they spent on food did not rise as fast as incomes; thus the relative demand for foodstuffs was less. On the other

^a Excluding the trade among these Communist countries.

hand, certain raw-material exports were important expanding sources of revenue. In general, however, underdeveloped countries found that what they could buy with a given amount of exports of primary commodities became less, that is, the terms of trade were going against them. (This was not true for every underdeveloped country, nor was it true for all years; in some years the terms of trade shifted in favor of less developed countries; but the generalization is valid for the whole period 1945-68.) In Latin America and Africa, underdeveloped countries had little success in exporting manufactured products. On the other hand, in Asia, certain less developed countries did undertake substantial exports of labor-intensive manufactured goods.

MANUFACTURED EXPORTS AS % OF TOTAL
EXPORTS IN SELECTED ASIAN COUNTRIES, 1964

Republic of Korea	46.6
India	42.8
China (Taiwan)	32.0
Pakistan	24.5

SOURCE: United Nations, *Economic Survey of Asia and the Far East*, Bangkok, 1966, p. 190.

In the main, however, underdeveloped countries remained exporters of primary commodities and importers of manufactured articles. Prices of commodity exports fluctuated in world markets and underdeveloped countries sought means of controlling the price and promoting more exports. They entered into international commodity agreements; 1962: UN Conference on Trade and Development (UNCTAD) was organized at the insistence of less developed nations, it considered the problems facing exporters of primary products. Many countries on their own established government export cos. or marketing boards, which sought to promote exports and stabilize the price of the exported commodities. (Examples: 1946, 28 May: Establishment in Argentina of the Instituto Argentino de Promoción del Intercambio-IAPI; 1945 ff.: establishment of Marketing Boards or *caisses de stabilisation* to control marketing of cocoa in Ghana and Nigeria; coffee in Ivory Coast, Uganda, and Kenya, cotton in Nigeria and Uganda, peanuts in Nigeria and Senegal, etc. 1961: Foreign trade became a government monopoly in Egypt.)

Imports: Less developed countries tried to increase exports in order to obtain foreign exchange to buy goods from abroad, as they industrialized, the manufactured goods that they imported showed a definite shift from consumer to producer goods. Often less developed countries maintained barriers against imports to encourage local industry; most protected their indigenous industries with high tariffs. Less developed countries typically had restrictions on imports, including licensing, limitations on the allocation of foreign exchange, multiple exchange rates, and even prohibitions on some imports. 1960's: A few less developed countries had state-owned trading cos., which carried out the major part of the import trade. 1966: Algeria had a number of government-owned units, which had monopolies over imports. The Guinean state enterprise handled a large part of that nation's imports. Imports of jute, sugar, tea, olive oil, and certain medicines were a government monopoly

in Iraq, while imports of sugar, salt, tobacco, cigars, and cigarette papers were a government monopoly in Libya. The Ghanaian National Trading Corporation handled much of that nation's import trade. The lowering of restrictions on foreign trade so typical of the industrial nations in the postwar years was less characteristic of the underdeveloped countries, where trade restraints remained the norm. Each nation wanted to protect its own industry and aid its own development.

Regional integration: Some attempts were made toward regional integration, but these were on the whole not as successful as the EEC. Latin America: 1960, 18 Feb.: Treaty of Montevideo signed by Argentina, Brazil, Chile, Mexico, Paraguay, Peru, and Uruguay; it established the Latin American Free Trade Association (LAFTA); the treaty took effect 2 June, 1961; 30 Sept., 1961: Colombia joined; 3 Nov., 1961: Ecuador joined; 1966: Venezuela, 11 July, and Bolivia, 12 Dec., joined; the goal of LAFTA was to eliminate internal trade barriers by 1973; 1960-65: trade within the LAFTA countries increased by 86%. 1960, 13 Dec.: General Treaty on Central American Economic Integration, signed at Managua, Nicaragua, by Nicaragua, El Salvador, Guatemala, and Honduras (took effect June 1961); July 1962: Costa Rica accepted the treaty provisions and joined the Central American Common Market; the Central American Common Market showed quick results; 1960-65: trade within the market increased more than 300%. 1966: Establishment of the Andean Group, a subregional group, comprising Chile, Colombia, Ecuador, Peru, and Venezuela (Bolivia joined in 1967). This group of countries, which were also in LAFTA, proposed a customs union and free transit within their region. 1967, 11-13 Apr.: U.S. President Lyndon B. Johnson visited Punta del Este, Uruguay, and met with the Latin American presidents; new plans were made for a Latin American Common Market, with the goal of free internal trade by 1985; under the new plans the 11-nation Latin American Free Trade Association and the 5-nation

Central American Common Market would be merged. Africa: Colonial policy gave a kind of regional integration; there were no tariff barriers between French colonies or between British colonies. Integration, however, was based on the territories of the mother country; French Africa used the franc; British Africa used sterling. Trade between French and British Africa was negligible. Before independence there were some efforts at increased integration; independence meant national policies; some new tariff barriers rose; border crossings became complicated by red tape; coins and bank notes bore new national designations. Yet after independence there were renewed efforts at regional integration, which were challenged by nationalist disintegration, and then once more new attempts were made at integration. The key attempts at economic integration were: 1953-63: the Federation of Rhodesia and Nyasaland provided economic as well as political unity. 1959: 2 customs unions were formed: (1) The Conseil de L'Entente, involving the Ivory Coast, Upper Volta, Niger, and Dahomey (Togo joined in 1964); this customs union was never implemented; and (2) the Union Douanière Économique d'Afrique Équatoriale, involving Congo (Brazzaville), Gabon, Central African Republic, and Chad (1962: Cameroon was also included). 1960, 26 Dec.: Ghana, Guinea, and Mali agreed to coordinate their economic and monetary policies; later Upper Volta endorsed the agreement (this attempt at economic integration failed). 1961, Dec.: East African Common Services Organization united Kenya, Uganda, and Tanganyika in a *de facto* common market. 1963, 20 July: Yaounde Convention was signed by 17 independent African states—Burundi, Cameroon, Central African Republic, Chad, Congo (Brazzaville), Congo (Léopoldville), Dahomey, Gabon, Ivory Coast, Mali, Mauritania, Niger, Rwanda, Senegal, Somalia, Togo, and Upper Volta—and Madagascar; the group became associated with the European Economic Community for 5 years (the convention became operative 1 June, 1964). 31 Dec.: The breakup of the Federation of Rhodesia

and Nyasaland left intact the regional economic integration among the 3 countries, which was only shattered by the 1965 Unilateral Declaration of Independence from Britain by Rhodesia. 1964, Dec.: The Treaty of Brazzaville authorized an economic union, comprising Congo (Brazzaville), Gabon, Central African Republic, Chad, and Cameroon—nations already in the Union Douanière Économique d'Afrique Équatoriale. 1966, 1 Jan.: Inauguration of the Central African Customs and Economic Union, as authorized by the Brazzaville Treaty. 4 May: 8 East African countries—Burundi, Ethiopia, Kenya, Malawi, Mauritius, Tanzania, Uganda, and Zambia—signed a co-operation agreement as a transition until an East African Economic Community could be created. 3 June: Treaty signed in Abidjan, Ivory Coast, establishing a customs union for West Africa. 15 Dec.: The Abidjan Treaty went into force; included in the new West African Customs Union were Ivory Coast, Upper Volta, Niger, Dahomey, Mauritania, and Senegal; the treaty provided for a common external tariff and discriminatory duties against goods coming from outside the French franc area and the European Economic Community; this superseded the Conseil de L'Entente. 1967, 6 June: Kenya, Tanzania, and Uganda signed a treaty in Kampala, which established an East African Economic Community and Common Market. 1 Dec.: The Kampala Treaty came into effect; it provided for the strengthening of existing common-market ties among the East African nations and the transfer of the headquarters of the East African Common Services Organization from Nairobi, Kenya, to Arusha, Tanzania. Kenya, Tanzania, and Uganda planned to establish a common customs tariff against imports into East Africa; the treaty guaranteed freedom of transit of goods across the national borders within the common market. Middle East: 1964, Apr.: Agreement reached to establish an Arab Common Market (effective 1 Jan., 1965); agreement was signed by Iraq, Jordan, Syria, and the UAR.

FOREIGN INVESTMENT. Less developed countries continued to be recipients of private foreign capital.

NET FLOW OF PRIVATE LONG-TERM CAPITAL FROM DEVELOPED MARKET ECONOMIES TO NEWLY DEVELOPING COUNTRIES, 1956-65
(\$ million)

	OECD Estimate	UN Estimate ^a
1956	\$2,578	
1957	3,230

1959	2,435	
1960	2,580	
1961	2,593	2,362
1962	1,914	1,600
1963	1,872	1,808
1964		2,009
1965		2,703

SOURCE: Organization for Economic Co-operation and Development, *The Flow of Financial Resources to Less-Developed Countries, 1956-1963*, Paris, 1964, p. 19, and United Nations, *Statistical Yearbook 1966*.

^a The UN estimates are lower because the UN excludes the flow of resources to Cyprus, Greece, Malta, Spain, Turkey, and Yugoslavia which are included by the OECD. Other adjustments are also made, which add to the discrepancy between OECD and UN estimates.

The flow of private foreign capital to these nations seemed inadequate to supply their needs. The flow was not greater because of the uncertainties of investment in less developed areas and because of the more promising investment possibilities in developed countries. 1945-68: Most less developed countries (except the Communist nations, which expropriated foreign holdings) viewed private foreign investors with mixed feelings. On the one hand, they feared and resented the presence of foreign investment, because (1) it might interfere with national sovereignty (impede national planning, thwart national defense, exercise undue power); (2) aliens pocketed the profits; (3) other benefits—payments of certain wages and salaries, payments for patents, payments for equipment, etc.—went to foreigners; (4) the enterprise might be more in the interest of the investor than the nation

where the investment was made; (5) it might destroy local business that could not compete with giant foreign units; (6) it might discourage entrepreneurship, since foreigners took advantage of the opportunities; and (7) it might create new desires for goods that less developed countries did not have and that if obtained would result in a drain of the nation's foreign exchange. Thus, some non-Communist countries attempted to rid themselves of certain existing foreign investments, for example: 1946: Argentine government purchased the assets of the foreign-owned telephone system; 1948: Argentina completed its purchase of the British-owned railroads. 1951, 15 Mar.: Iran nationalized the Anglo-Iranian Oil Co. (1954, Aug., a settlement was reached which allowed foreigners to develop the Iranian oil fields). 1952, 31 Oct.: Bolivian government nationalized the 3 largest tin-mining enterprises (foreign and domestic capital had been intermingled in these ventures). 1956, 26 July: Egypt nationalized the Universal Co. of the Suez Maritime Canal, owned in large part by the British government and French private stockholders (in time, they were reimbursed). 1957, Dec.: Indonesian government took over some 400 agricultural estates as well as a number of banks, industrial firms, and transportation lines owned by Dutch investors. 1958 ff.: A number of countries in Latin America acquired the properties of the foreign utilities there. 1962, 27 Apr.: Ceylon nationalized 83 gasoline stations and other oil facilities owned by 2 American cos. Other countries barred new foreign investment in certain sectors, for example, in oil distribution, refining, and production, in petrochemicals, and in industries whose products were facing stern competition. India, for example, banned foreign investors from industries "reserved as a State responsibility." 1965: Foreign investment in the form of direct equity participation was not allowed in Burma and Indonesia (but with the fall of Sukarno, the situation changed in Indonesia; 1967: Indonesia again desired to attract foreign investment). On the other hand, less developed countries often

greatly desired foreign investors because (1) the latter provided needed capital frequently unavailable elsewhere; (2) they provided required skills, patents, and equipment, plus the knowledge of the functioning of an industrial economy; the last was essential, for projects undertaken by foreign investors were likely to be well formulated and implemented; (3) they could be taxed, and would provide an excellent source of government revenues; (4) by developing natural resources, they gave poor countries the opportunity to earn foreign exchange; (5) they provided employment, (6) they often served not to discourage other industries but, quite the opposite, to stimulate ancillary industrial activities. 1960's: Less developed countries often indicated that they desired certain types of foreign investment and not others. Likewise, as the bargaining power of less developed nations rose, these nations often stipulated as a condition of doing business that the foreign investor make a marked contribution to their economies. In turn, less developed nations actually provided a range of incentives to encourage foreign investors. Such incentives included tax relief, aid in providing overhead facilities, protection from competition, exemptions from duties on capital goods required for the establishment of a plant, and release from payment of duties on certain raw-material imports (if the raw materials were not available locally).

FOREIGN AID. Less developed countries were recipients of foreign aid from industrial nations and international agencies. Foreign aid provided capital for projects that could not otherwise have been undertaken. Technical assistance was an added type of foreign aid, which offered less developed countries skills that they lacked. Foreign aid did not present conflicts for less developed countries that private foreign investment created, although bilateral aid was often considered as politically motivated and created other conflicts. A few less developed countries had their own foreign-aid programs. 1954-65: According to UN statistics, Communist China committed the equiva-

lent of \$835 m. to foreign aid. Underdeveloped countries in Eastern Europe—Poland, Hungary, Rumania, and Bulgaria—had small foreign-aid programs. 1960's: Arab oil-producing nations, such as Kuwait, considered foreign-aid programs.

BUSINESS ORGANIZATION. 1945-68: Key trends involved: (1) More participation by the state in business activities. In less developed countries in Eastern Europe and in Communist China, North Vietnam, and North Korea, all business enterprises came to be owned and operated by the state. In many non-Communist countries governments owned large enterprises. (2) More participation by local entrepreneurs in the modern sector. In Latin America, where the state played a substantial role, private enterprise also flourished. Small businesses run by individuals, families, or partnerships still prevailed in Latin America, yet at the same time many Latin American entrepreneurs managed modern corporations. Large industrial empires existed in Argentina, Brazil, and Mexico, created by entrepreneurs of Italian origin. In Medellin, in Colombia, modern enterprises, run by Colombians, prospered. A substantial middle class was developing in Latin America to provide a basis for the modern business. In Hong Kong, Malaysia, and Singapore, private enterprise prevailed; increasingly, entrepreneurs—many of them Chinese—took part in the modern sector of the economy. In Africa, entrepreneurship was in evidence, although in the growth of modern business enterprises, tropical Africa was far behind Latin America and even far behind most of Asia. In much of Asia and Africa the traditional producing unit, made up of individuals, bound by ties of kinship,

religion, and social status, was challenged by the emergence of modern business enterprise. Widespread use of money in Asia and Africa provided the basis for the growth of business enterprise. (3) Decline of the "managing agent" in India. 1954: Of the total productive assets of companies in India, the Federation of Indian Chamber of Commerce and Industry estimated that nearly 80% were managed by managing agents. 1956: Indian Cos. Act restricted operations of the managing agent 1956-68: Less use of the managing agent form in India. To some extent, new "management contracts" between Indian enterprises and foreign firms represented an adaptation of the old form. (4) 1950's and 1960's: When large foreign enterprises existed, they often tried to encourage local businesses, providing jobs to local contractors, buying when possible from local suppliers, and utilizing and stimulating local service industries. (5) In many less developed countries new enterprises combined private and public, domestic and foreign capital. There were enterprises that were entirely domestic, which combined government and private funds; there were enterprises that involved co-operation between public-sector cos. and foreign investors; there were enterprises that involved private-sector cos. or individuals and foreign investors. The extent of these combinations was new in less developed countries. (6) Late 1950's and 1960's: In Eastern Europe, there was a marked decentralization of decision-making in state enterprises 1957 ff.: Mainland China, following the Soviet model, began to decentralize its economic planning; this was not fully implemented. 1961: After the failure of the "Great Leap," indications

were that decentralization plans had been abandoned. 1960's: In most non-Communist less developed countries, successful government enterprises seemed to have developed considerable independence from centralized direction. (7) As modern businesses took form in less developed countries, managerial talent was required. 1950's and 1960's: An attempt was made by industrial nations to aid in establishing business schools and training programs in less developed lands. Moreover, literally thousands of students—financed by their governments, by foreign grants, or by foreign companies—went to industrial countries to learn business methods. Managerial contacts served to communicate business methods. There was an injection of western business procedures throughout the world.

GOVERNMENT POLICY. 1945–68: Independent governments of less developed countries accepted the goal of rapid industrialization; they insisted it would not do for their countries to remain producers of primary products and importers of manufactured goods; the commitment to manufacture became general, in Communist and non-Communist developing countries, in former colonial states and long-independent countries. Industrial countries were seen as world leaders; governments of less developed countries wanted to follow the same path. A few governments—such as that of Mainland China—went to the extreme of seeking economic self-sufficiency. Economic nationalism became a key to many governments' policies. In most less developed countries, governments assumed leadership in planning the growth of industry. Development plans were characteristic of less developed countries. Some plans were partial, some were general, but all involved governments in actively promoting economic growth. Some of the early plans were developed by colonial governments in the colonies or in London, Paris, or Brussels; these were designed to encourage economic growth, but did not generally seek to sponsor industrialization; some were influenced by colonial powers; by the 1960's, development plans were prepared by national governments and were

practically all devoted to industrialization; as the 1960's progressed, however, planners recognized that effective industrialization also involved planning improvements in agriculture.

Aids to agriculture: Most government plans recognized a need for government aid to agriculture. Aid took the form of assistance in providing chemical fertilizers, irrigation, flood control, and technical advice. Aid occasionally involved rural electrification. The initiation of land reform was designed in part to assist agricultural output (although this was not always the reason for it or the effect of it).

Government-sponsored co-operatives: Governments participated in marketing boards and export cos. which it was hoped would assist agriculture (but did not always do so). Governments were involved in extending agricultural credits. They also took part in negotiations for international commodity agreements which provided aid to agriculture.

Aids to industry: Governments of less developed countries offered aid to domestic industries through such measures as (1) allocation of investment funds; (2) protective tariffs; (3) import quotas and exchange controls, which barred competitive products; (4) outright prohibition of the entry of competitive goods; (5) providing foreign exchange for cos. to import needed (but not locally available) raw materials and machinery; (6) a favorable (often a special) rate of exchange for imports of required raw materials and machinery; (7) exemptions from certain taxes, or tax concessions of various types (including good depreciation allowances); (8) promises to foreign investors that they could transfer their capital and their earnings freely; (9) subsidies to industries that exported; (10) establishment of industrial estates with power, water, transportation, and other facilities; and (11) rarely, monopoly privileges or assurances that no other cos. in the same industry would be allowed to enter the market. In Communist countries, and some non-Communist countries, aids to industry involved allocations of funds to those industries desired under the development plans.

INITIATION OF ECONOMIC DEVELOPMENT PLANS BY DEVELOPING COUNTRIES, 1945-66

- 1945 Ecuador; British Colonial Development and Welfare Act, leading to development plans for Barbados, Basutoland, British Guiana, British Honduras, Cyprus, Dominica, Gold Coast, Grenada, Jamaica, Leeward Islands, Nigeria, Northern Rhodesia, Nyasaland, St. Kitts-Nevis-Anguilla, St. Helena, St. Lucia, St. Vincent, Seychelles, Sierra Leone, Tanganyika, Uganda
- 1946 Angola, Argentina, Poland, Sudan; French Plan Pleven for development of French colonies
- 1947 Bulgaria, Ceylon, Czechoslovakia, French Cameroons, Greece, Philippines, Yugoslavia
- 1948 Burma, East Germany, Iran, Swaziland; all countries of the French Union
- 1949 Belgian Congo, Ruanda-Urundi
- 1950 Colombo Plan, affecting Ceylon, India, Malaya, North Borneo, Pakistan, Sarawak, Singapore
- 1951 Albania, Antigua, Iraq, Liberia, Macao
- 1952 Aden, French Guinea, India
- 1953 Brunei, Capo Verde, Mainland China, Mozambique, North Vietnam, Portuguese Guinea, Republic of China (Taiwan), Timor
- 1954 Italian Somaliland, Jordan, Kenya, North Korea, Surinam
- 1955 Guatemala, Pakistan, Syria
- 1956 Afghanistan, Bechuanaland Protectorate, Cambodia, India, Indonesia, Malta
- 1957 Ethiopia, South Vietnam
- 1958 Mainland China
- 1959 Chad, Iceland, Laos
- 1960 Chile, Colombia, Guinea, South Korea, United Arab Republic, Venezuela
- 1961 Bhutan, Cameroon, Congo (Brazzaville), El Salvador, Fiji, India, Mali, Nicaragua, Niger, Senegal, Thailand
- 1962 Bolivia, Dahomey, Honduras, Lebanon, Mexico, Turkey
- 1963 Bermuda, Brazil, Congo (Léopoldville), Costa Rica, Federation of South Arabia, Gabon, Haiti, Israel, Libya, Panama, South Africa, Turkey, Upper Volta
- 1964 Canary Islands, Gambia, South Africa, Spain
- 1965 Kuwait, Malawi, Uruguay, Zambia
- 1966 Cameroon, India, Togo, Zambia

Aid to other sectors: Less developed countries were concerned about the development of transportation and port facilities, public utilities, and education. Such activities were in large part undertaken by government bodies. Governments sought out funds from development banks to apply to such infrastructure investments.

Direct participation: 1945-68: Governments of less developed countries gener-

ally participated directly in economic development. In Communist nations (in Eastern Europe, Mainland China, North Vietnam, North Korea, Mongolia, and, after 1960, Cuba), government ownership became the rule. Government ownership of large enterprises also became widespread in Latin America. 1966: Chilean government for the 1st time participated directly in the copper industry. 1960's: In non-Communist Asian nations,

such as Afghanistan, China (Taiwan), Indonesia, Iran, South Korea, and the Philippines, governments assumed an important role in starting such key import-substituting industries as cement, fertilizers, chemicals, rubber tires and tubes,

iron and steel, and machinery, textiles, and sugar. In India the government participated directly in iron and steel production; in petroleum production, refining, and distribution; in fertilizer and other chemical industries. The Indian govern-

ment ran the railroads and produced locomotives for them. 1961: The Indian government reserved for the state such other industries as arms and ammunition, atomic energy, heavy castings and forgings, heavy plant and machinery, coal and minerals, aircraft and air transport, shipbuilding, telephones and telephone cables, telegraph and wireless apparatus (excluding radio sets), and generation and distribution of electricity. 1960's: The government of Ceylon invested in the nation's nascent steel industry and established a plywood factory, paper factory, vegetable-oil mill, footwear factory, ceramic factory, cement plant, and sugar factories. 1963 ff.: The Burmese government committed itself to bringing about the gradual government ownership and development of the whole industrial sector; it established a steel plant, a pharmaceutical industry, spinning and weaving mills, a brick plant, and cement works. 1950's and 1960's: Throughout the Middle East public-sector operations increased. Middle Eastern governments established government-owned oil and petrochemical companies. 1961, July: United Arab Republic nationalized most of the industry, finance, transport, and foreign trade in Egypt and Syria. 1964, July: Iraq nationalized its key industries and its financial institutions. 1960's: Government ventures in Africa became extensive in Ghana and Tanzania; in many other African countries, governments, through mixed enterprises with foreign capital, became involved in developing industry.

REGIONAL PLANS. Not only did countries develop customs unions and development banks on a regional basis but other attempts were made to create regional economic integration

Latin America: 1945: Establishment of the UN Economic Commission for Latin America, which did studies of regional development problems. 1948 ff.: The Organization of American States, basically a political organization, had an economic and social council; 1959 ff.: the OAS became more concerned with problems of economic development.

Africa: 1945: Establishment of the UN Economic Commission for Africa, which promoted regional economic development. Pan-Africanist sentiment had impact on regional planning for economic development.

Middle East: 1945, 22 Mar.: Arab League formed; it was basically a political organization, but it also considered economic problems.

Asia: 1945: Establishment of the UN Economic Commission for Asia and the Far East (ECAFE), headquartered in Bangkok, which made studies on means of promoting economic development. 1950, 28 Nov.: Colombo Plan was established to channel funds and technical assistance from the U.S., Canada, Europe, and Australasia to certain South and Southeast Asian nations; it had no funds of its own. 1957, Sept.: Under the auspices of ECAFE, establishment of the Committee for Coordination of Investigations of the Lower Mekong Basin after an international agreement was made among the governments of Cambodia, Laos, Thailand, and the Republic of Vietnam to develop water resources in the Mekong Delta. 1961, July: Association of Southeast Asia was established by Malaya, Thailand, and the Philippines; it sought to exchange economic data among these countries. 1964, July: Organization for Regional Co-operation for Development (Turkey, Iran, and Pakistan) formed to coordinate the economic planning of all 3 countries. 1965, July: Pakistan and Indonesia created the Indonesian-Pakistan Economic and Cultural Organization. 1967, Aug.: Association of Southeast Asian Nations came into being as a successor to the Association of Southeast Asia; it included Malaysia, Thailand, the Philippines, Indonesia, and Singapore.

OTHER FACTORS. Ideas contributed to economic change. The idea of progress: in many countries for the 1st time there was the possibility of improving the lot of the average individual. The idea that reason, science, and engineering could be applied to control the environment and could substitute for tradition, superstition, and magic was new in many countries.

The concept of equality, the equitable distribution of wealth, provided a basis for land reform, taxation, and many measures that were breaking down the old order and assisting in economic growth. The idea of socialism in some less developed countries—although not in all—provided a break with tradition. The idea of independence from colonial domination and the development of political sovereignty in Africa and Asia offered a basis for industrialization. The idea of nationalism was important in contributing to economic development; industrialization in Germany, Italy, Japan, and Russia, as well as in other countries, had been marked by the growth of intense nationalism; this was also the case in less developed countries. Attempts at regional co-operation among less developed countries met major obstacles because each nation sought its own independent development. This was especially true in Latin America, to some extent in Asia (especially Communist China), while in Africa, national lines were still being defined. The idea of regional co-operation in economic development vied with the idea of nationalism. Regional co-operation had many advantages, and the success of the European Economic Community provided an example of what many less developed nations aspired to achieve. Less developed countries were confronted with the problem of the huge gulf between them and the industrial

nations of the world. Even though development was occurring in underdeveloped countries, the gap between them and the industrial nations seemed to broaden. This was a gap between poor and rich nations, the imitators and the innovators in technology, the countries that had to seek out capital and those that had considerable capital resources, those with an unskilled and untrained population and those with a highly trained labor force. Moreover, the gulf between poor and rich nations began to be copied *within* underdeveloped countries, where poverty and wealth stood in contrast, where traditional methods of work vied with new technology borrowed from the industrial nations, where labor-intensive activities provided a sharp contrast with modern sector enterprises financed by foreign investment or foreign aid, and where illiterate majorities stood out in stark contrast to educated nationals of less developed countries. Political instability in less developed countries was another factor which often retarded economic development. Less developed countries—many of them newly freed from colonialism—appeared more prone to *coup d'états* and revolutions than industrial nations; changing governments and civil disorder slowed the development process. The need of a politically stable base for economic development had not been met in many countries.

GOVERNMENT AND SOCIETY IN AN AGE OF REVOLUTION

The Constitutional Order

THE NATURE OF CONSTITUTIONALISM

INTRODUCTORY. While the meaning of the word "constitution" is not a fixed one, a constitution has generally been regarded as the supreme law of a state, by reference to which all other laws, enactments, actions, and dispositions of the instrumentalities of that state are judged. A constitution usually consists of general principles which are accepted as binding standards of lawful action. Written constitutionalism was formally introduced in the U.S. in 1787, and the U.S. Constitution remains the oldest written constitution in use. In 1789 the French National Assembly adopted a "Declaration of the Rights of Man and of the Citizen," and from that time on state after state has adopted a written document, generally called a constitution, to serve as its basic law.

Some states, however (notably Great Britain), although possessing a constitutional form of government, do not have the fundamental principles by which their citizens live set down in a single document. In the British case a progressive limitation of the prerogatives of the monarch—the Magna Carta, 1215; the *Confirmatio Cartarum*, 1297; the Petition of Right, 1628; the abolition of the Court of Star Chamber, 1641; the Habeas Corpus Act, 1679; the Bill of Rights, 1689; the Act of Settlement, 1701; and the Act of Union with Scotland, 1707—created constitutionalism without a (single) con-

stitution, since these documents have always been regarded by the British people as compacts of everlasting duration. Their provisions have been respected by later acts of Parliament and have been rendered effective by judicial interpretation.

Modern constitutionalism, as exemplified in the U.S. and France, arose because of the desire of men seeking freedom under law to strike down the pretensions of absolutist monarchies. A republican form of government was sought in order to deny the claims of an unfettered royal prerogative, of a "divine right" of kings, and of the doctrine of "*l'état, c'est moi.*" The French Declaration of the Rights of Man drew its inspiration from the theories of the European Enlightenment, from the practical experience of Frenchmen under the *ancien régime*, and specifically from the bills of rights previously adopted by the American states. From the late 18th cent. onward, constitutionalism has sought to articulate the individual freedoms which the citizens of a state feel themselves entitled to demand, and to lay down, permanently and with precision, the limits beyond which the authority of governments may not extend.

ELEMENTS OF A WRITTEN CONSTITUTION: PREAMBLE. The development of constitutional forms has resulted in general agreement on what such a document should contain. Almost every constitution begins with a preamble. Typically, the preamble states the source of the constitution's authority, and sets out its ideals and objectives. The brief

52-word preamble of the U.S. Constitution, 1787, speaks the language of the Enlightenment. The German constitution of 1871, written in the period of national unification, refers to the need to safeguard German territory.

More recent constitutions, such as those of many independent African states, affirm an adherence to broad political and social ideals. The Moroccan, 1962, speaks of the necessity for African unity, while others, e.g., the constitution of the Ivory Coast, 1962, proclaim support not only for the principles of democracy and of the Declaration of the Rights of Man but also for the principles of the UN Charter.

The preamble to the constitution of the Republic of South Africa, 1961, indicates that its people are "convinced of the necessity to stand united." The preamble to the constitution of the People's Republic of China, 1954, describes in detail the "heroic struggle" of the Chinese people to achieve socialism.

FORM OF GOVERNMENT. A constitution also describes the form of government under which the people of the polity to which it applies will live. Constitutions have been written for empires (e.g., the German Empire, 1871) and monarchies (e.g., Italy, 1848), but more often for republics (e.g., France, 1959). In more recent times nations have described their forms of government in terms of social classes. The Italian constitution of 1947 declares: "Italy is a democratic republic based on labor." The constitution of the People's Republic of China, 1954, states that "China is a people's democratic state led by the working class and based on the alliance of workers and peasants." The description in the constitution of the 5th French Republic, 1959, of France as "an indivisible, secular, democratic, and social Republic" has been transferred directly to the constitutions of at least 12 former French African colonies. As independent states they have adopted most of the provisions of the French constitution as their basic law.

SOVEREIGNTY. Constitutions usually also describe the source of sovereign, or ultimate, power. Most declare that sovereignty resides in the people (e.g., the

U.S., 1789, and Belgium, 1831). Others proclaim that it resides in the nation (e.g., Chile, 1925, Burundi, 1962, and Turkey, 1945). Others again ascribe sovereignty to (1) "God alone [but] given by His will as a sacred trust to the State" (Libya, 1951), (2) an emperor (Ethiopia, 1955); (3) "the working people of town and country" (USSR, 1936); and (4) the pope (Vatican City Constitutional Laws, 1929).

STRUCTURE OF GOVERNMENT. Most nations employ written constitutions to establish and delimit their governmental structures. A 3-branch structure (executive, legislature, judiciary) is common. Separate functions result in a separation of powers, while the sharing of many functions results in a system of checks and balances. This form of government, usually with an elected chief of state, and usually therefore republican, is the most widespread. Constitutional monarchies, where surviving, are today generally characterized by the same tripartite division of powers.

The legislative branch, with the principal function of enacting laws, often consists of a 2-house body (U.S., Britain, France), although many nations have a unicameral legislature (Israel, USSR). Popular universal suffrage is the rule.

Some nations elect a president by direct popular suffrage to serve as chief of state and head of government (Brazil). Others elect a president who serves as chief of state, while a prime minister elected by Parliament heads the government (Italy). While the principal function of the executive is to oversee the administration of law, some countries vest much legislative power in the president (France), while in others parliamentary rule is almost complete (West Germany). Party responsibility dominates the British model, which depends on constant majority rule and collective responsibility for governmental action. The U.S. model is marked by a lack of collective party responsibility and by no removal of the chief executive from office following an adverse parliamentary vote.

All nations provide for an instrumentality to adjudicate citizen disputes and legal grievances and to enforce the

law of the land. Written constitutionalism has tended to create judiciaries independent of the other branches of government, since they exist by constitutional right and not at the whim of executive or legislative fiat. Strong executive action, however (e.g., Ghana, 1964), can deprive a judiciary of its independence, whether constitutional safeguards are present or not. Many states (e.g., the U.S.) vest powers of review in their highest judicial bodies. Possession of review power enables the judicial branch to pronounce upon the constitutionality of both legislative and executive acts, and strike them down if deemed contrary to the state's fundamental law. Some states, however (e.g., South Africa), forbid constitutional adjudication by their judiciaries.

AMENDMENT. Every constitution makes provision for amending itself, since it is necessary from time to time for a state's fundamental law to be adapted to changing conditions. In the U.S. the constitutional amendment process is formal and arduous. One result of this has been that, since the Bill of Rights, the U.S. Constitution has been amended only 15 times. On the other hand, the U.S. Constitution has readily lent itself to judicial interpretation, and a resort to frequent amendments has not been so necessary as might otherwise have been the case.

India represents the other extreme. The Indian constitution is detailed and contains many provisions usually found in statutes. A relatively simple amending process is therefore appropriate—a $\frac{2}{3}$ majority in both houses of Parliament. Certain fundamental provisions of the Indian constitution, however, notably those affecting executive powers, state powers, and property rights, can be amended only by more difficult procedures.

Many countries, particularly those in Latin America, where the average life of a constitution has been less than 20 years, have had numerous constitutions. Venezuela has had 23, the Dominican Republic, 22, and Haiti, 18. France has had, since the Revolution of 1789, 2 empires, 2 kingdoms, and 5 republics.

It is not the rule that constitutional amendment follows constitutional pro-

cedure, since constitutional government can be overthrown as well as any other. In Latin America, between Mar. 1962 and Apr. 1964, 7 military coups deposed constitutional, duly elected presidents. In Africa, between June 1965 and Feb. 1966, another 7 governments were overthrown.

HUMAN RIGHTS

THE CONCEPT OF HUMAN RIGHTS.

Almost every constitution lays down the fundamental rights of the citizen. The U.S. Constitution lists them, mainly in the form of a group of constitutional amendments commonly designated the Bill of Rights. The American example has been followed by many states.

In the course of time the concept of fundamental human rights, which in the late 18th cent. meant mainly political and religious freedoms, has achieved a broader applicability. Many social and economic rights are now guaranteed constitutionally. Moreover, whereas previously human rights were thought of primarily as those rights which were judicially enforceable, the 20th cent. has witnessed the drawing up of constitutions which establish nonenforceable rights as well. These may be intended to serve as a guide to instrumentalities of government (India, 1949) or to describe the goals of the individual citizen rather than his current situation (Mexico, 1917).

Some nations (e.g., Saudi Arabia, 1926, and South Africa, 1961) are without constitutionally declared rights. On occasion in the past citizens' rights have been deliberately abrogated (Law Centralizing the Administration of Justice, Germany, 1935). Guarantees of human freedom, moreover, are not always enforced even when clearly specified in written constitutions.

PROTECTION OF LIFE AND LIB-

ERTY. Constitutional provisions in the area of the protection of life and liberty are generally designed to safeguard the dignity and worth of the individual. They prohibit slavery and inhumane treatment. The last 200 years have seen a steady erosion of legally sanctioned denials of human dignity (slavery, serfdom, outcaste

status, etc.) and the appropriate constitutional safeguards are almost universally acknowledged in theory. In practice, however, emergency situations, such as war, and the elevation by some states of the well-being of society as a whole above that of the individual (Law for the Protection of German Blood and German Honor, Germany, 1935) have led to the loss by large numbers of the most fundamental human rights.

FAIR PROCEDURES IN THE ADMINISTRATION OF JUSTICE. Constitutions also commonly stipulate that all citizens shall enjoy the benefits of a fair and impartial system of justice. These may include the right to a jury trial, and usually do include immunity from arbitrary arrest, the right to a speedy trial, the right of a man to face his accuser in a court of law (trials *in absentia* being specifically prohibited), and the right to a legal defense, often provided, if necessary, at state expense. In addition to the traditional protections against double jeopardy and *ex post facto* laws, the more modern constitutions often contain detailed provisions concerning the conduct of trials and limitations on the penalties that may be imposed.

PERSONAL FREEDOMS. Political, social, economic, and religious freedoms are guaranteed by many constitutions. In the period following the French Revolution of 1789 the constitution drafters were most concerned with political and religious guarantees. These included the right of religious observance; freedom of thought and conscience; freedom of speech, of the press, and of assembly; a limited right to vote; and the sanctity of privately owned property. Since then, however, modern constitutions have not only expanded the right to vote and limited the right of property but have greatly extended the scope and number of guaranteed individual rights. In many states these now include the right to an education, the right to work, the right to form political organizations, the right of free marriage, the right to travel, freedom of communication between citizens, and the right to form trade associations. Socialist nations have sharply curtailed private ownership of property (USSR,

1936), while some African nations (particularly those formerly under British colonial rule) have incorporated detailed guarantees of the right to private property (Kenya, 1963). Provisions calling for the social use of property and those in Latin America vesting subsoil mineral rights in the nation (Mexico, 1917) rather than in individuals or corporations have created conflict between capital-exporting and capital-importing nations.

WOMEN'S RIGHTS. The mid-19th cent. saw women uniting for the 1st time in political groups to strengthen their demand for equality with men. From that period onward they began actively seeking higher education and entry into professions previously barred to them. By 1840 the 1st formal women's suffrage movement had been organized, and progress toward constitutionally guaranteed rights for women began. New Zealand was the 1st state to extend the franchise to women, 1893. Women began voting in Britain in 1918 and in the U.S. in 1920. Other states soon followed. Ecuador was the 1st Latin American state to grant the vote to women, 1929, and France permitted them to vote in 1945. In Indonesia and in India, in particular, women played a vigorous role in the struggles for independence and were accorded full political rights after independence had been achieved. Today women vote in almost every state (Switzerland being the most notable exception). The greatest advances in this area, comparatively speaking, have been made in the Communist states, where full employment has meant encouraging female participation, at all levels, in the national work force. The UN enacted a Covenant on the Political Rights of Women in 1952—the 1st instrument of international law aimed specifically at advancing women's rights on a worldwide basis.

THE DEVELOPMENT OF CONSTITUTIONAL GOVERNMENT

1776-1810

UNITED STATES. Modern constitutionalism was born in the U.S. and in France, and tied, initially, to a rejection of mo-

narchical institutions. In the U.S. the British colonial administrations had proved oppressive and were judged intolerable; in France the ruling classes had lost contact with a politically awakening *bourgeoisie*. The result was revolution against the old order in 1776 in the U.S. and in 1789 in France.

The American "Founding Fathers" were profoundly influenced by French political thought and by British constitutional practice and precedent. Rousseau's and Montesquieu's ideas, reinforcing almost 2 centuries of British common-law tradition, were frequently cited as authority for political proposals. The Declaration of Independence, 1776, an assertion of natural rights and a list of the British government's misuses of power, was written and approved of by men conscious of an inherited legal tradition, familiar with the patterns of colonial self-government, and appreciative of the latest modes of political expression.

After a period of ineffective national government under the Articles of Confederation, 1781, a national Constitution was adopted, 1787, which was conservative in tone and reflected the new nation's need for stability, national organization, and order.

FRANCE. The French *philosophes* had intended to correct the abuses of the *ancien régime* by an attack on aristocratic government and by instituting basic changes in governmental structures. They hoped as well to affirm the natural birth-right of man to "liberty, property, security, and resistance to oppression" (Declaration of the Rights of Man and of the Citizen, 1789). Further, they built the constitution of 1791 around the need to correct specific abuses of the *ancien régime*.

The 1791 constitution, however, monarchical in form, was doomed to failure by political events, as also were the constitutions of 1793, 1794, and 1795. France was in turmoil and chaos, and while the constitution of 1791 represented a reaction against the *ancien régime*, the more conservative constitution of 1795 was a response to the Reign of Terror and the Jacobin constitution of 1793. In 1795 the constitution makers expounded not on

the rights of man, as the Declaration of Rights had done, but also listed his duties; they reposed sovereignty in the people, but limited it as well.

Nevertheless, the French constitutions of 1789-95 established a precedent that has lasted to the present day. Almost immediately constitutions based on the French model (and following in the wake of the French army) were proclaimed in part of Switzerland, 1798, and in the Italian states of Modena, 1796, Milan, 1797, Genoa, 1797, and Naples, 1799.

1810-1914

LATIN AMERICA. From 1810 onward the emergence of the U.S. as an independent nation capable of maintaining its independence served as an example to the Spanish colonies in Latin America. Similarly, the successful operation of the U.S. Constitution during several decades provided political inspiration. All Latin America (save Mexico, 1822-24 and 1862-67, and Brazil, 1824-89) adopted the republican form of government. Most newly independent Latin American states followed U.S. forms and structures of government and passed bills of rights. They also derived inspiration from the egalitarian and republican thought of late 18th-cent. France.

Latin America, however, was basically ill prepared for democracy. Years of tight colonial administration from abroad, regionalism accentuated by poor communications, an unyielding retention of power by the upper classes, fierce and divisive ideological conflicts, and revolutions that did not bring social reform inhibited the development of democratic government under law. Power was frequently seized by a *caudillo*, a regional or national strong man, supported by military force. Such leaders dominated Latin American politics for a century or more. The result was that, even though provided with adequate and sometimes admirable written constitutions, the Latin American states did not achieve the commonly accepted goals of constitutionalism.

INFLUENCE OF NAPOLEON. Soon after revolutionary France began spread-

ing its influence over Europe, Napoleon Bonaparte began exercising his own influence over the revolution. Successively first consul, 1799, first consul for life, 1802, and emperor, 1804, Napoleon, while retaining many of the superficialities of republicanism, turned France full cycle back to monarchy. He made France stable again, but erased most political rights in the process. His administrative, bureaucratic, and military reforms were lasting, but few of the constitutional structures he imposed survived his defeat in 1815.

TRIUMPH OF CONSERVATISM.

The fall of Napoleon occasioned the Congress of Vienna, 1814–15, which called for a restoration to their thrones of those European princes who had suffered at Napoleon's hands. Prompted by Metternich and Talleyrand, the Congress attempted to restore much of the old order on the principle of legitimacy. Absolutism was now replaced by constitutionality, but the constitutional states of Europe after 1815 were not legitimized by an appeal to the sovereignty of the people but by a grant delivered out of the hands of a beneficent king. In the period after 1815 a conservative reaction occurred even in Great Britain. The Habeas Corpus Act was suspended, 1816, and from 1819 to 1822 6 Acts of Parliament curbed the long-established rights of freedom of speech, of the press, and of assembly.

GROWTH OF PARLIAMENTARY DEMOCRACY. Despite the strength and initial success of the conservative reaction which followed the Napoleonic Wars, the leaven of French revolutionary ideas continued to work throughout Europe. Kings and subjects alike retained memories of freedoms enjoyed under the republican governments of the Napoleonic era. In Mar. 1822 Fernando VII of Spain was forced to accept reforms demanded by the Spanish Cortes. When Greece won independence from the Ottoman Empire, 1829, a monarchy was set up as a concession to the principle of legitimacy, but the power of the new king of Greece was constitutionally circumscribed. The attempt of Charles X of France to replace legitimist constitutionalism by absolute

rule failed when the revolt of July 1830 claimed his throne. When, in the same year, Belgium broke away from the United Kingdom of the Netherlands, legitimacy sustained another blow. A national Belgian Congress established strong parliamentary government, and Art. 78 of the constitution of 1831 limited the powers of the king to those the state granted him.

In Britain the supremacy of Parliament had already severely reduced the prerogatives of the monarch. The Reform Bill of 1832 increased the franchise, and the Chartist Movement, though defeated by 1848, laid the foundations of the constitutional democracy that was to be achieved in the years ahead: universal manhood suffrage, annual Parliaments, equal parliamentary constituencies, no property qualifications for office, and salaries for members of Parliament.

The aims of the revolutionaries of 1848 included constitutional government, and constitutions were promulgated in Austria, Piedmont, and Switzerland. Even in Asia constitutionalism made its mark. The Japanese constitution of 1889, though almost devoid of citizen guarantees, demonstrated an understanding of the technology of western government, and Sun Yat-sen introduced the concept of western constitutionalism to China after the revolution of 1912.

1914–45

REPUBLICANISM. For the 1st modern constitutional states, the U.S. and France, constitutionalism and republicanism had gone hand in hand. Elsewhere, however, constitutional democracy, where achieved, came about with only a slight reduction in the number of the world's monarchies. The Americas remained the only part of the world where the republican form of government could be regarded as the norm. In Europe, Asia, and Africa only 7 states were republics in 1916: Andorra, China, France, Liberia, Portugal, San Marino, and Switzerland.

The results of World War I, however, were so decisive, and the collapse of 4 great empires—the Austrian, German,

Russian, and Turkish—so complete, that in many areas entirely new states were formed and in others new governments created with wide freedom to fashion new constitutional forms. In Europe 6 new (fully independent) states appeared—Czechoslovakia, Poland, Finland, Estonia, Latvia, and Lithuania—and all were republics, with constitutions based on the principles of 19th-cent. liberalism, i.e., emphasizing political rights and avoiding questions of economic injustice. In all, however, democratic ideas and institutions were protected by constitutional forms. Czechoslovakia, for example, modeled its 1920 constitution on those of the U.S. and France. The depression severely tested the strength of newly won constitutionalism in Europe, and ended it in Latvia, Lithuania, and Estonia. Poland reacted to the threat of Nazi Germany by curtailing parliamentary government and concentrating power in the hands of the president. Only Finland and Czechoslovakia, among the new European republics, were able to maintain constitutionally guaranteed democratic forms between the wars.

In Germany the Weimar Republic was a brief essay in democracy after decades of absolutism. Turkey became a republic but, although its forms of government were strongly influenced by western examples, it soon fell under a 1-party regime. Only Bulgaria, among the states that were on the losing side in World War II, did not undergo radical constitutional transformation after the war ended.

THE SOCIAL CONSTITUTION.

While Europe was engaged in war, Mexico was witnessing a period of civil unrest which had not been fully resolved at the time of the adoption of the Mexican constitution of 1917. Europe responded to the postwar challenge by producing political constitutions. Mexico, by contrast, created the world's 1st social constitution, a document that has been widely imitated in Latin America and throughout the world.

Though an intensely nationalistic document, embodying few structural changes, the Mexican constitution was in other

respects strikingly innovative. It was the 1st constitution to emphasize the social value of privately owned property, thus laying a foundation not only for future strict regulation (later, nationalization) of private foreign investment but preparing for decades of successful land reform in a country where 25% of the land was once held by slightly more than 100 proprietors. The 1917 Mexican constitution established broad and comprehensive personal guarantees: the right to education, an 8-hour working day, social security, family rights, trade-union rights. It spoke not only of rights to be enforced now, but of the goals a nation should have before it if it is to achieve true democracy.

THE INTERWAR AUTHORITARIAN STATES. The USSR, though possessing a theoretically constitutional form of government, created a political system under which individual rights were subordinated to the demands of the state. In the Stalin era, popular guarantees had meaning only within the context of the requirements of the Communist Party and were limited by the Party's interests. Italian Fascism promised efficient and strong government, industrial peace, prosperity, salvation from Communism and a revival of the glories of the Roman past. To achieve these ends the Fascists altered the Italian constitution and devitalized Parliament. A "corporate state" was created, 1925, in which labor, industry, commerce, and the arts were wedded to government. Citizens' rights were consciously subordinated to the needs of the corporate state. In Germany, Hitler attained power by constitutional means, but from Mar. 1933 he and his Nazi henchmen ruled dictatorially. All forms of dissent were ruthlessly suppressed, and the most fundamental of human rights, that to life itself, was repeatedly and flagrantly denied during the years of the Nazi tyranny. Authoritarianism and arbitrary governmental action also marked the activities of the Japanese state as, in the period leading up to World War II, civilian agencies of the Japanese administration were increasingly subordinated to control by a militarist elite. By the time

the war began, a large part of the world was being ruled by governments which rated state or party interest above constitutionally guaranteed popular rights.

1945-68

THE COMMUNIST STATES. After World War II, Communist governments were established in East Germany, Poland, Czechoslovakia, Hungary, Rumania, Bulgaria, Yugoslavia, and Albania. As satellites of the USSR (Yugoslavia broke away from the Soviet bloc in 1948) these states adopted economic programs in harmony with Soviet policy and united politically with the USSR against the West. Socialist constitutions, modeled on the Soviet constitutions of 1918, 1924, and 1936, were adopted, reposing sovereignty in the working class. Acceptance of the concept of the "unity of the people's power" meant that the classical western constitutionally guaranteed separation of powers was not adopted. Nevertheless, although all Communist states limit personal freedom if that freedom is used, or is likely to be used, for "antidemocratic" purposes, they guarantee many social and economic rights, such as free medical services, free education at all levels, inexpensive housing, and full employment.

NEW NATION STATES IN ASIA AND AFRICA. The end of World War II signaled the beginning of the end of imperial and quasi-imperial rule throughout Asia and Africa. The Islamic states of the Middle East adopted constitutional forms of government on achieving independence, but have not yet seen fit to guarantee full religious freedom or equality between the sexes. The state of Israel, though without a written constitution, guarantees the rights of its citizens in its Declaration of Independence, and possesses a judiciary noted for its vigor in redressing violations of personal liberty suffered by Israeli citizens. In Japan constitutionalism was restored by the U.S. occupation, and an independent judiciary created. Some court decisions, 1960, have limited the freedom

of assembly for political purposes.

The constitution of India, 1949, borrowed heavily from the rest of the world. Definitions of fundamental rights were taken from the U.S. Constitution, a federal structure from the Canadian, a parliamentary system from Britain, and the notion of nonjusticiable directive rights from Ireland. Despite serious economic crises India has remained committed to the preservation of democracy, and its citizens' fundamental rights have been construed liberally by zealous courts.

All of Africa, with the exception of Liberia, Egypt, Ethiopia, and South Africa, was under foreign domination until the 1950's. In the period of colonial rule Africans were not without constitutional rights, though their European rulers tended to act more arbitrarily in overseas dependencies than they did at home. As the African states attained independence, they erected their new governments on a firmly constitutional base, accepting in most cases the principles of the separation of powers, the independence of the judiciary, and the need for citizens' guarantees. It was in Africa (Lagos, 1961) that an International Commission of Jurists proclaimed that "fundamental human rights, especially the right to personal liberty, should be written into and entrenched in the constitutions of all countries."

Human rights, however, have often been ignored in independent Africa. Ghana established laws, Sept. 1962, permitting police detention for 28 days without charges being preferred and indefinite "preventive detention" on the authority of the attorney general; Dahomey dissolved all political parties, Nov. 1963, after jailing the president of the supreme court; in May 1966, political parties were outlawed in Nigeria. Numerous military coups—in Algeria, Congo (Kinshasa), Dahomey, the Central African Republic, Nigeria, and Ghana between June 1965 and Feb. 1966 alone—have removed legitimate governments by unconstitutional means.

The Social Order

THE NATURE OF SOCIAL MODERNIZATION. The 2 defining characteristics of a modern society are a high degree of differentiation and of integration.

The former refers simply to specialization. A highly differentiated society is one in which the various tasks necessary for keeping the economic, political, and cultural subsystems going are performed by specialized social units. In contrast, in an undifferentiated society particular social units perform a much larger variety of tasks.

A high degree of integration means that most if not all segments of the society interact with each other and are in some way dependent on each other, and that, as a result, they all share a set of common basic cultural principles or values. In a poorly integrated society, various geographical parts may be almost self-sufficient and independent of the rest of the society, or particular classes may have value systems basically different from other classes, or they may exist largely outside the economic life of other classes, or they may be barred from power in the political life of the society. In a highly integrated society the elimination of these separations enables the society to effectively mobilize all of its parts when threatened by danger. Class differences are not ended (they may actually be intensified), but classes interact more fully and co-operate more effectively.

The history of social modernization is one of increasing differentiation (which increased social efficiency) and of an accompanying integration (which was needed to tie the various parts of society together in an age of specialization). In the past, societies that failed to differentiate sufficiently also failed to industrialize and keep up economically with more "modern" societies that were quicker to adapt. On the other hand, nations that failed to integrate sufficiently did not

hold together; either provinces broke away or else semipermanent class warfare disrupted them as various "out" classes attempted to seize the benefits of "in" classes.

The process of increasing differentiation and integration did not go smoothly in all modernizing states. As men were forced into new occupations and life patterns, and as they increasingly demanded a share of political, economic, and cultural power, tensions inevitably developed. The working out of these tensions produced the social revolution that has created the modern world.

Modernization in the sense here defined began in Western Europe and spread from there during the 19th and 20th cents. to the rest of the world.

RURAL DISLOCATION AND URBANIZATION IN THE WEST, 1750-1900

POPULATION. A striking characteristic of the period between 1750 and 1900 in Western Europe and the U.S. was the rapid increase in population (pp. 877 ff. below).

APPROXIMATE TOTAL POPULATION
(million)

	1750	1800	1850	1900
Britain	c. 7.5	10.5	20.8	37.0
France	c. 20.0	27.6	35.8	39.0
Germany	-	24.5	35.4	56.4
U.S.	1.5	5.3	23.2	76.0

As industrialization increased, so did urbanization. By 1871, 61.8% of the population of England and Wales lived in urban districts. Urbanization, though still considerable, was less marked in the U.S., France, and Germany. In 1870, 74% of the U.S. population was classed as rural; 68.9% of the French population, 1872; and 63.9% of the German, 1871.

The populations of the modernizing

states were much affected by migration. Britain and Germany lost many people, mainly to the U.S. and, in the case of Britain, to her dominions (pp. 881-883 below).

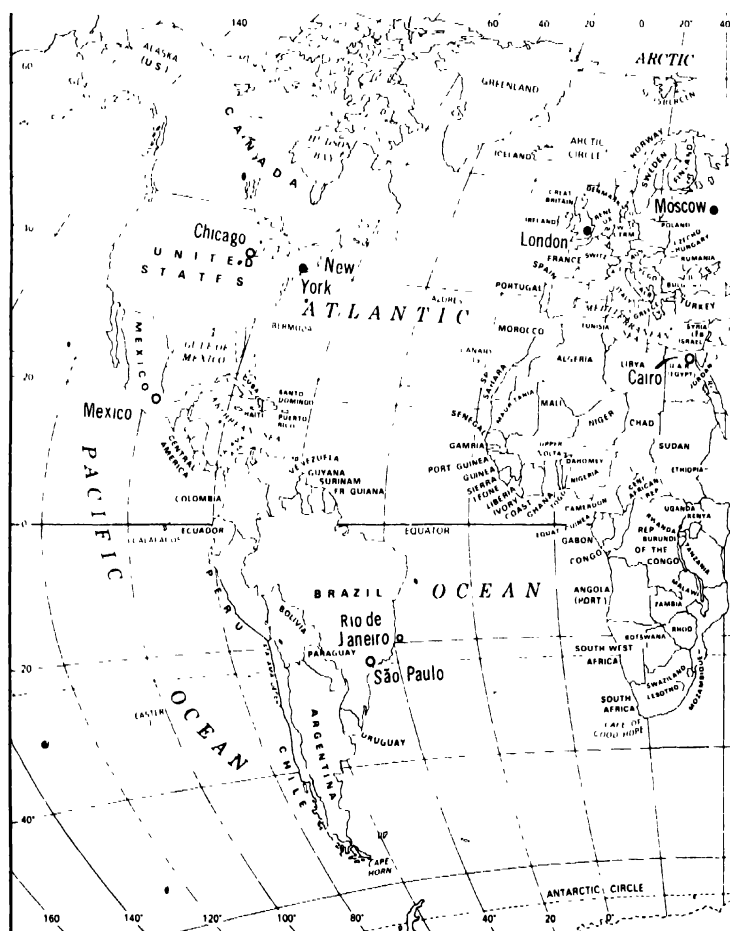

TOTAL EMIGRATION FROM BRITAIN AND GERMANY (000)

	Britain	Germany
1846-50	199	
1851-60	1,313	622
1861-70	1,572	634

Fewer Frenchmen emigrated, but France suffered a population loss when Alsace-Lorraine was added to the German Empire, 1871.

Over-all population increases in the modernizing nations were made possible

primarily by the rapid advances achieved in agricultural technology (p. 655). But improvements in agriculture also had the effect of making much of the rural population unnecessary for food production. In England, 1710-1830, one result of better rural technology was the enclosure movement (p. 655) in which landlords and prosperous farmers evicted the small peasantry from the land by prohibiting them the traditional usage of common lands. France had no enclosure movement, and there was no direct pressure on the peasantry to abandon the land (which explains the relatively slower rate of urbanization of France compared to that of England and Germany). But France's population, already the densest in Europe in the 17th cent., continued to

grow well into the 19th. French farms became smaller and smaller, and because land tended to be divided equally among all a farmer's sons, many peasants found themselves with uneconomic holdings and this forced them to emigrate to the cities.

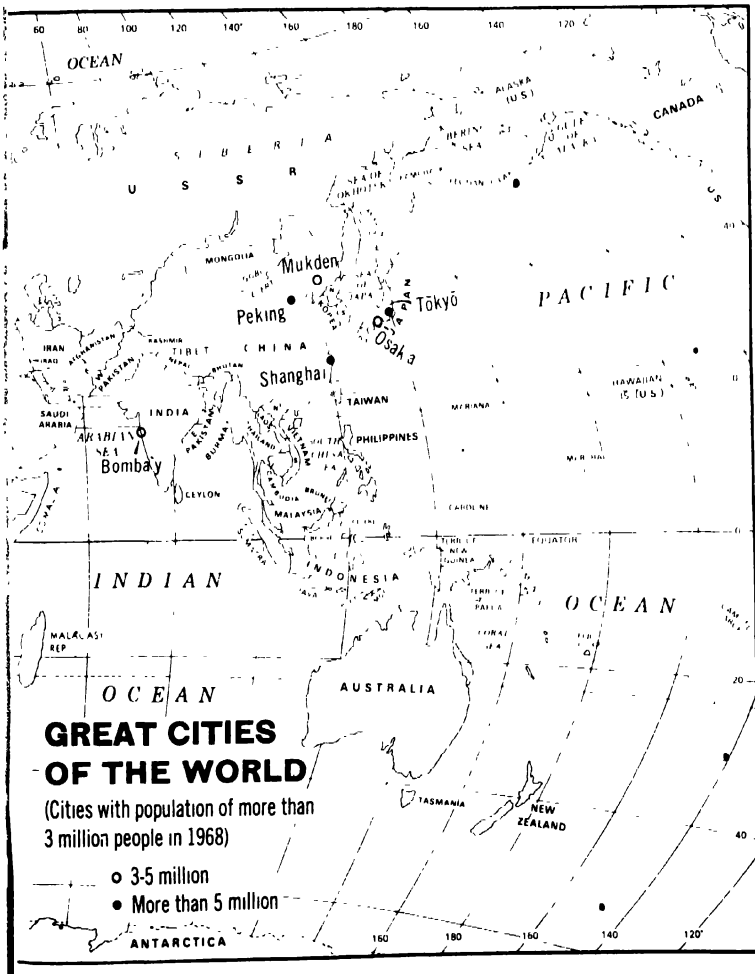

In Germany the formal emancipation of the serfs in 1807 allowed the more efficient landowners to take over the small and inefficient holdings. In the half-century that followed emancipation, the proportion of lands controlled by the big estates grew rapidly. While the East Prussian estates grew most rapidly, most of western Germany did not escape the trend. Marginal peasants were forced off the land and into the growing industrial zones (and many, eventually, to America).

The pattern in the U.S. was exceptional

because it was the immense immigration from Europe between 1860 and 1910 and not internal migration that swelled the urban labor force. Meanwhile, the rapid extension of cultivated lands in the West and the improvement of agricultural techniques more than kept pace with the rising food needs of the country. Since it was European social disorders that forced the bulk of the immigrants into the U.S.'s cities, the U.S. profited from these without itself having to experience them.

The population growth and urbanization of Western Europe and the U.S. coincided with a greatly stimulated industrial development.

SOCIAL EFFECTS OF INDUSTRIALIZATION. There had long been cities before the growth of modern industrial

% OF POPULATION LIVING IN CITIES
OF MORE THAN 10,000 PEOPLE

	1800	1850	1890
U.K.	20.0	38.5	59.0
France	9.5	14.5	26.0
Germany	7.2 ^a	10.5	30.0
U.S.	3.8	12.0	27.5

^a For Prussia only, 1816.

ones, but their economic and social organization was different. Premodern cities were centers of commerce and artisan production, but no city until modern times developed a machine-based production system. The old cities had fairly small-scale units of production which depended on the individual skills of specialized craftsmen. Industrial cities, on the other hand, relied on their easily operable machines and abundant unskilled labor. In the old artisan centers, craftsmen were organized into closed guilds or even hereditary castes. In the industrial cities, such closed, restrictive practices were replaced by open recruitment of workers and constant competition within industries to make their machines produce ever more cheaply to raise profits.

The 1st country to establish such an industrial system on a large scale was Great Britain (p. 657). British industrialization was in a sense spontaneous. But as British exports spread, less efficient local handicrafts in many countries suffered. It became increasingly obvious that in order to meet the British threat, other countries also had to industrialize. The ideas and techniques of industrialization spread quickly. But while certain societies were sufficiently well organized to industrialize themselves, others were not. Those countries that failed gradually became economic, and often political, colonies of the industrialized West.

Urbanization and industrialization everywhere created similar sorts of social problems. Essentially, the peasants of Western Europe had lived in small communities bound by traditional rules of mutual support. Families were large and included more distant kin than they now

do. The extended family was committed to supporting its members. Behavior in economic and political activities was also regulated by traditional rules, and each individual had his security more or less assured by the community. But as demographic forces pushed men off the land, the old families and communities broke up and their mutual support functions were not replaced by new institutions. Individuals became isolated and only marginally useful units. The early factory system demanded long working hours in poor conditions, and female and child labor was more cruelly exploited than it had ever been before. Wages were low and workers were reduced to bleak existences further accentuated by the feeling of loss and the frightening uncertainties felt by the new immigrants.

As workers were detraditionalized by their new environments and exposed to the material wealth of the richer classes in the cities, their discontent with the social order grew, and they eventually began to organize themselves into protest movements demanding a redress of the wrongs done them. But since the rural dislocation and urbanization that occurred were spread over a long period of time, and since the workers were not at first sufficiently numerous, concentrated, or organized to act against the system, it was the protest movements by the better established and more coherent middle classes spawned by early industrialization that dominated the social scene in the West in the latter part of the 18th and in the first half of the 19th cents.

BOURGEOIS DEMANDS AND REVOLUTIONS, 1770-1860

RISE OF THE BOURGEOISIE. To finance the machines and factories necessary for industrial production, and to lead and organize this production, it was necessary to have a certain amount of capital and to have certain skills conducive to maximization of profits and efficiency. The leaders of industrialization were the

financial and industrial bourgeois, or capitalists.

This group had its antecedents in Western Europe in the commercial middle classes that had dominated European trade for several centuries before industrialization. It was during that period that such financial institutions as joint-stock companies and credit banks had been established, and that the techniques of modern accounting and large-scale organization of production were learned.

But throughout the period of developing commerce that preceded industrialization, there persisted a conflict between the old landowning feudal aristocracy and the rising merchant class. The former felt it deserved a near monopoly of prestige and high political office, while the latter felt that its commercial skills and growing wealth entitled it to a share of prestige and power. The revolutionary wave which began to sweep Europe toward the end of the 18th cent. was essentially a struggle between the old feudal aristocracy and the rising middle classes that wanted to replace it.

The desires of the middle classes between 1750 and 1850 were roughly similar throughout the West. They wanted their societies to promote or at least permit the expansion of the commercial and industrial activity on which they, as a class, depended. This required a sufficiently large market and the possibility of conducting commerce freely within it. It required protection against outside competition. It required at least that modicum of social and political stability that is necessary for commerce and for the defense of property rights. Finally, the middle classes wanted social recognition in the form of high prestige for their most successful members, for this would legitimize the pursuit of profits which had been considered somewhat immoral in earlier European society.

The outcome of the revolutions between 1774 and 1848 was largely determined by the degree to which middle-class demands were met in various western countries. These demands were enshrined

in a liberal value system that asked for national unification and the elimination of internal restrictions on trade, government co-operation against threatening outside forces which frequently took the form of militant nationalism, government abstention from regulating society in any way that might preserve artisan production against the more efficient industrial producers, repression of radical anti-property movements such as socialism, and voting rights and democracy for the *bourgeoisie*. The liberal ideology claimed that the less government interference there was, the better, but only up to the point at which government interference became necessary to help the middle class.

There were various middle classes and their interests were not always identical. For example, the old artisan class favored the extension of voting rights, but was resolutely opposed to the development of large-scale industries which put it out of business. This old middle class was gradually pushed down by industrialization and became the most radical of the lower classes in the 19th cent. The rural middle class wanted tariffs against foreign crops but not against outside manufactured goods (which it bought) if these were cheaper than domestic goods. The industrial middle class had precisely the opposite interest. And in all the countries being discussed there were somewhat distinct financial, commercial, and industrial middle classes whose interests sometimes coincided but at other times clashed.

U.S. The 1st of the modern revolutions was the American one. The 13 American British colonies emerged from the war with France, 1757-63, heavily dominated in the North by mercantile interests and in the South by a rural planter class. American society was characterized by the almost total absence of a feudal aristocracy and by the equal absence (with the exception of the southern Negro slaves) of a serf class. Thus the 2 extreme forces that plagued Europe throughout the 19th cent., the diehard reactionary aristocratic element and the uprooted small peasant, were largely absent. From

the Boston merchants to the small farmers, the entire society fitted into a sort of all-encompassing middle class with a common liberal ideology. These were the "self-made" men who had achieved whatever position they had through their own work and who naturally felt entitled to rule themselves. On the other hand, these were not the sort of men who felt impelled to achieve a radical transformation of the entire social system, although a change in a more egalitarian direction did come about as a result of the American Revolution.

The British attempt to tighten political control over the American colonists at the end of the French and Indian War led to resentment. The colonists considered taxation without representation to be a grievance, although representation in Parliament was not in fact a colonial demand. But, worst of all, Britain tried to restrain the commerce conducted by the Americans in order to favor British merchants. Simultaneously, the southern planters were heavily indebted to the British merchants from whom they imported their consumer goods, and the small American farmers were increasingly indebted to the coastal American merchants from whom they bought their finished goods and to whom they sold their produce. Almost all segments of the middle class had some sort of grievance against the system, and the middle class was all-pervasive. These grievances were channeled against the British by the revolutionary leaders, who were primarily those men of substance who wished to free themselves in order to attain what they felt to be their rightly deserved position of eminence in the society.

The Revolutionary War ended in 1783, but the internal goals of the Revolution were not yet met. The failure of the colonies to unite effectively and to establish a common legal and monetary system displeased those commercial interests which felt that national integration was a prime requisite for a sound economy. The Constitution of 1787 enshrined liberal values demanded by the middle class and city workers without ending

sources of conflict between the merchant *bourgeoisie*, the planter class in the South, and the interior farmers. The virtue of the Constitution was that it established a system ideally suited to later industrialization with only one major exception, the preservation of slavery. Though the various state constitutions continued to require property qualifications for voting, a substantial proportion of the white males could nevertheless vote. (Yet it was not until 1807 that the 1st state abolished all restrictions on voting for white males and, as late as May 1842, there was an armed rebellion in Rhode Island by forces demanding universal white male suffrage.) A common money, a common foreign policy, and the abolition of internal trade barriers were the other main aspects of the integration demanded by Americans. Aside from this, a common language and a shared implicit belief in the allocation of social prestige by achievement rather than by birth were already part of the American value system.

GREAT BRITAIN. If Great Britain ever had a bourgeois revolution, it took place in the 1640's, not in the 18th or 19th cent. By 1750 British economic and social conditions were already favorable to the growth of a middle class. The nation was politically united and there were no internal restrictions on trade. The government's foreign policy successfully kept outside markets open for English business and the import of primary products from the colonies flowing. Perhaps most importantly, the British aristocracy was a viable and profit-oriented class which saw no objection to rational business activity. This enabled capitalist methods to spread quickly into agriculture and made British agriculture the most efficient in the world.

As Britain industrialized, the business class remained nonrevolutionary. During the wars with France between 1790 and 1815, they felt that the defense of their continental markets by their government against the Napoleonic blockade justified their remaining passive as various radical movements threatened the social order.

These tended to be dominated by artisans who were beginning to be hurt by the growth of industry. There were riots in 1795 and 1797 against the war with France, but these were easily repressed. Later there developed the Chartist movement, which was a radical lower-class protest organization. It reached its culmination in the 1830's and 1840's, but its failure to attract middle-class support doomed it.

Despite periodic depressions the British economy grew rapidly between 1780 and 1850 (p. 659). As economic progress was achieved, the middle classes won increasing political power through parliamentary reform (Reform Bill, May 1832). This was crucial in keeping them socially conservative. Similarly, the repeal of the corn laws, June 1816 which had imposed tariffs on cheap food imports against the interest of the urban business class (and working class), did much to convince the middle classes that they could gain their ends peacefully.

Only Catholic Ireland was left out of this evolution (culturally expressed by the persistent hostility to Catholics in Britain despite their formal emancipation by the Act of 1829).

FRANCE. If the American and British middle classes had their basic desires more or less easily satisfied between 1780 and 1850, the same cannot be said about their French and German counterparts. There only violent revolution achieved the national integration necessary for modernization.

In 1789 France was notably less integrated than Britain. There were internal tariff barriers and various laws antithetical to the development of business. (For example, nobles could theoretically lose their privileged status by engaging in ordinary nonagricultural business; though this regulation was unevenly enforced, it symbolized the conservative character of the regime.) The monarchy was aware of the problem. In 1774 it tried to eliminate internal trade barriers. But the entrenched nobles who dominated the *parlements* were intent on preserving their local privileges, and the inefficiency

of the bureaucracy blocked the reforms.* By 1789 the government was bankrupt and incapable of helping French commerce keep its foreign markets against British incursion.

To be sure, the Paris crowd and the rebellious peasants who together provided the shock troops of the Revolution could not properly be called middle class. In fact they were revolting against the economic modernization that was spreading capitalist methods into agriculture and threatening the small artisans in the city. But the leadership of the Revolution fell into the hands of the better organized and educated middle classes. When the petty artisans, the radical *sans-culottes*, threatened to take power, the middle classes turned more conservative. The radicals were overthrown on 27 July, 1794 (on the 9th of Thermidor by the revolutionary calendar). First the Convention, 1794-95, and then the socially more conservative Directory, 1795-99, came to power. In 1799 the military coup led by Bonaparte was in large measure prompted by the continued fear of the *bourgeoisie* of the radical masses.

The reforms of the Revolution and of Napoleon exemplify the meaning of national integration. The remnants of the old feudal order were abolished between 4 and 11 Aug., 1789. On 26 Aug. the Declaration of the Rights of Man took away the privileges of the nobles and made advancement in the administration conditional on merit rather than birth (though of course the statement of the principle did not make it so, and only the *bourgeoisie* rather than the poor really profited). On 26 Feb., 1790, France was divided into 83 departments to create a more centralized and efficient administration to replace the chaotic mosaic of the traditional provinces. Internal trade barriers were eliminated. On 12 July the church was officially subordinated to the state. On 24 Aug. a centralized judiciary was created. On 17 Mar., 1791, guilds were abolished (but on 14 June trade unions were made illegal). On 20 Sept., 1792, registration of births, deaths, and marriages passed into the hands of the

state (rather than the church as before) and divorce was legalized. On 1 Aug., 1793, a common system of weights and measures was established. In 1794 and 1795 a series of higher schools were created to train the upper levels of the technical bureaucracy. The tax structure was rationalized, and between 1799 and 1801 an even more thorough centralization and simplification of the fiscal structure were decreed. The Bank of France was created, Feb. 1800. The *lycées*, or state secondary schools, were founded and numerous scholarships established for good students, May 1802. The final form of the revised civil code (the Napoleonic Code) was proclaimed in Mar. 1804. Throughout the entire period from 1789 to 1815 a strong attempt was made to keep out British industrial goods, at first through tariffs (thus reversing the royal policy of 1786), and then by war.

The symbol of national unity was the army, which for the 1st time in Europe included all classes. No longer was the officer corps to be a small noble elite but rather the most able from all classes, leading a large mass of conscripts. This, more than Napoleon's military genius, made France powerful during this period. Ironically, the spread of similar reforms and of French nationalism during Napoleon's successes eventually turned against the French and defeated them between 1813 and 1815.

The attempted partial restoration of monarchical ways after Napoleon's defeat in 1815 caused another revolution in France in 1830.

In spite of the 1830 revolution, only the rich were enfranchised. The Orleanist monarchy was dominated by the high financial and agricultural *bourgeoisie* whose old-fashioned banking and credit techniques inhibited rapid economic growth. Risk taking was discouraged, and heavy tariffs protected native industry against outside competition. Between 1830 and 1848, coal production tripled but fell behind Belgium's. Pig-iron production doubled but fell to $\frac{1}{4}$ of Britain's. Railway construction took place, but much more slowly than in Britain or

parts of Germany (p. 689). Poor adaptation to industrialization was a main cause of the business crisis of 1846-51. It was this and the arbitrary exclusion of the middle ranks of the *bourgeoisie* from politics that disillusioned this class with the system.

It was not the *bourgeoisie* that took to the streets in 1848 to overthrow the government, but the proletariat, which had been suffering from repeated economic crises. But whereas in Britain the middle classes did not support worker action, in France they did (briefly) and again took control of the revolution and assured its success. After a short interlude of radical fervor, the middle classes once again turned conservative and a new Napoleon came to power, 10 Dec., 1848, to save the propertied against the masses. It was during the reign of Napoleon III (1848-71) that France seriously industrialized. Railroad construction went up 6-fold, investment banking was restructured, foreign trade tripled, and booms in stock-exchange speculation characterized the period and marked the lasting triumph of the middle class in France.

GERMANY. The problem of national integration was much more severe in Germany than in either Britain or France. Before the Napoleonic era Germany was politically fragmented and Prussia merely the biggest of a host of German states. The social modernization of Germany began only during the Napoleonic period. In southwestern Germany Napoleon consolidated the petty states into several larger ones, 1803-6. Prussia was not under direct French control, but its military humiliation persuaded its aristocracy that some modernization was necessary for national survival. Laws were promulgated to enable Prussia to mobilize against France. Serfdom was ended, Oct. 1807. Municipal self-government was encouraged, 1808; the army was reorganized, 1808-10; guilds were abolished, 1810-11; and universal military conscription decreed, 1814. These moves were accompanied by a conscious glorification of things German to arouse opinion against the French. The result was a

revolution from above, which succeeded well enough in reviving Prussian military power and in driving out Napoleon.

After the Napoleonic Wars the aristocracy and the Prussian court reverted to a more natural conservatism, but the social effects of the reform continued. The artisan class declined, the cities grew, and the great industrial bourgeois families of Germany, such as the Krupps, were founded. The various customs unions of the 1830's further stimulated the growth of industry. But the aristocracy retained its political privileges, and at least in Prussia there was no development of constitutional government (though southern German states continued to be more progressive than northern and eastern ones). The period, in fact, was characterized by ostensible tranquillity covering the changes and labeled the Biedermeier era (after an architect whose complacent style epitomized the times).

As in the case of the French revolution of 1848, the mass discontent that exploded in Germany in the same year was largely fed by discontented artisans who were losing their positions to the growing industries. There had been several outbreaks of discontent in the 1820's, 1830's, and 1840's, but the revolution of 1848 was far more serious because it was supported in the countryside by the impoverished peasantry, and, most importantly, it was joined by the middle-class liberals who had long been in the opposition. It was the latter element that seized control of the revolution (p. 190).

The turmoil released by the 1848 revolution, however, separated the *bourgeoisie* from its lower-class supporters. The peasant uprisings destroyed too much property, the artisans asked that industrial freedom be curtailed, and the liberals were alienated. The middle-class response in trying to stop a revolution opened the door for the aristocracy, who regained power by playing, on the one hand, on the dislike of the poor for the *bourgeoisie*, and, on the other, on the *bourgeoisie's* fear of instability and radicalism.

Though the revolution was quickly defeated, the conflicting forces it had brought into play set social policy in Germany for the rest of the century. Toward the poor, the policy was to be fairly generous (by 19th-cent. standards). On 16 May, 1853, child labor was proscribed (at a time when it was still current in Britain and France) in Prussia, and throughout the decade other measures pacified and relieved the poor. For the bourgeois there was nationalism which was translated into German unification, protection from outside competitors, and an aggressive foreign policy. For the bourgeois there was also full industrial freedom and the social acceptance of the wealthiest industrialists into the aristocracy through intermarriage. For the aristocracy, especially for the Prussian Junkers, there was, 1st, the imposition of tariffs against food imports (part of the protectionist policy of 1879) and, 2nd, the maintenance of high social prestige and the senior positions in the army. Binding all this together was an aggressive nationalistic monarchy and a bureaucracy whose top members were largely recruited from the richer classes. The upper middle class won a victory in the economic sphere at the price of surrendering political control to the aristocracy and the monarchy.

OTHER EUROPEAN COUNTRIES.

The growth of a middle class, and with it the desire for national independence and integration, took place to a greater or lesser extent elsewhere in Europe.

The case of Austria-Hungary demonstrates what happens to a modernizing society which fails to integrate itself culturally. In 1848 there was no unified Austrian revolution; instead there was a Czech, a Hungarian, an Italian, and an Austrian uprising. The way was paved for the eventual disintegration of the empire.

In Russia there was no middle-class revolution because the middle class remained much too small. In the mid-19th cent. the economic developments which had unbalanced Western Europe had not yet occurred on a large scale in Russia.

In the rest of Eastern Europe the idea of nationalism spread, but the social and economic base of the middle classes was too weak to make its demands a real issue. Rather there was a series of nationalist uprisings against the Russian, Ottoman, and Austrian empires without strong accompanying liberal movements.

At the start of the 19th cent. Italy was as politically disunited as Germany, and throughout the 1st half of the century the goal of national unification was most deeply cherished by middle-class liberal secret societies (p. 149). Since it eventually proved too difficult for these groups to unite their country, there developed, as in Germany, a monarchical-liberal alliance that eventually succeeded in performing the task.

In industrializing countries like Sweden economic progress such as the development of the railway system after 1850 brought with it the eventual triumph of liberalism within several decades. But in countries like Spain (which had little economic development outside of Barcelona) no middle class evolved. The agrarian sector of the society was little changed and political life was more typical of nonmodern societies than of the more developed European nations.

THE WESTERN INDUSTRIAL SOCIETIES, 1860-1914

THE NATURE OF RATIONALIZATION. In those countries where bourgeois revolutions and demands achieved a measure of success, and where there was successful industrialization, there followed certain institutional and value changes. Not only were political structures changed but also the structure of families, religions, and daily work for most people. Attitudes toward these also changed. The ideal of rationalization spread from the economic to other sectors of society, as differentiated and specialized institutions were created at all levels to perform tasks previously left to more diffuse structures.

The dominant value of industrialization is rationalism. In business terms this is the capacity to take a given goal (prof-

its) and consciously to examine the most suitable means of attaining it. Nonbusiness considerations such as family ties, religious beliefs, or the host of loyalties and obligations normally held by men must be relegated to a lesser place insofar as economic management is concerned.

Rationality was not "invented" by middle-class entrepreneurs. The origins of western rationality are old and the systematic, rational pursuit of knowledge began in Europe during the Renaissance. Then the idea was to isolate the causes and effects of various natural phenomena from the bundle of religious and moral values of the time. Just as business rationality examines the best means of gaining profits and judges success by the careful accounting of results, so did modern science from the 16th cent. onward judge the validity of its theories by the careful measurement of phenomena to see if the theoretical predictions coincided with observed events. In rational business as in science, when events did not match expectation, new methods or explanations were sought.

The modern period was preceded by the expansion of rationality into religion. A basic idea common to most varieties of Protestantism was that each believer ought to examine the Bible to find in it the correct principles. The means to attainment of proper religious thought were to be chosen and religious success measured by worldly results, not by hypothetical abstraction. Each individual was required to bring his life into harmony with his religion, and success in the former was interpreted as a sign of grace in the latter. Thus the pursuit of business and scientific rationality was in harmony with religious expectations.

The flowering of intellectual rationalism took place in the 18th cent., when the notion of rationality spread to the examination of society and governments. But it was not until the growth and economic triumph of the middle class in the 19th cent. (a little earlier in Britain and the U.S.) that such rationalization spread to the wider society.

The most obvious consequence of

economic rationalization was a vastly increased division of labor. Within factories more and more workers performed smaller and more precise tasks as part of an assembly line. A host of new occupations was created. For example, full-time scientists first appeared in the 19th cent.; before, there had only been amateurs who rarely received their income purely from research. The numbers and types of doctors, lawyers, and engineers vastly increased. Types and varieties of industries multiplied. An index of this large-scale differentiation was the growth of property, contractual, and administrative law and a relative decline in the importance of religious and moral law.

THE FAMILY. A further consequence of industrialization was increased social mobility. Rationality demanded that the best men be picked for the right jobs and, although this principle was very far from being thoroughly carried out in the 19th cent., the need for efficiency at least caused widespread recognition of merit. Through education or business or administrative skills it became possible for men to advance above the positions into which they were born. The expansion of the middle-class "liberal" professions further opened the door to social advancement through education. Even people who did not raise their relative standing in society could realistically hope to raise their material prosperity, and to educate their children sufficiently to raise their standing.

Families had been the principal economic, welfare, and educational units in society. In the industrial cities they ceased to be units of production. Schools took over much of the educational function. Moreover, the dispersion of families through migrations in search of work disrupted the extended family and destroyed its capacity to take care of its old and disabled members. In the new industrial society elders were a drag on a couple's ability to live well and finance an education for their children. Similarly, too many children impoverished a family and made it less likely that the children would be well-enough educated to rise to higher social status.

The destruction of the extended family was not simply the result of economic pressures. The young could escape from the restrictions of their elders and move to the city which had no restrictive traditional obligations. Once married, young people desired to maximize their own enjoyment of material benefits and not to share them with others.

Europe's population through the early 19th cent. had continued to rise because of the decline in death rates due mostly to economic advances. But as the upwardly conscious middle class became an ever larger proportion of the society, the birth rates began to fall (p. 875). Rates fell most sharply among the middle classes, who saw a real possibility of improving their position, or at least their children's, and not so much among the very poor, who had no such hope. It was, moreover, the middle classes who tended to accumulate a certain amount of property and did not want to have to leave it to too many children. Neither the very rich nor the very poor had such concerns.

Not only the industrial and commercial middle class but also the small landowning peasantry, who felt many of the same desires for the preservation of their property, limited the number of their children. In fact, this phenomenon was chiefly one of the lower middle class, landowning peasants, shopkeepers, and lower-level bureaucrats. France, the proverbial nation of little shopkeepers and small farmers, had almost no increase in population between 1870 and 1940.

In many rural areas in Western Europe the increased life expectancy of the old (which meant that they kept control of their farms longer), the lack of new lands, and the increasing capital requirements for running successful farms drove the young to the cities and overseas. Areas that had no industry lost population. For example, between 1848 and 1900 Ireland's population dropped from 8.2 million to 4.5 million. (See further "World Population," pp. 877 ff.) • •

THE CHURCHES. Along with the family and the economy, religious institutions were also changed by industrialization and the spread of the middle-class

ethic. Whereas churches had claimed wide competence outside of strictly religious matters, their field of action was gradually restricted during the 19th cent.

In the first half of that century the bulk of the middle classes in Catholic Europe tended to be pronouncedly anticlerical because of the alliance of the church and the old aristocracy. Even in Protestant countries the middle classes tended toward opposing the power of official churches. In the U.S., for example, religion was excluded from direct interference in politics even though it continued to play a large role in men's personal lives. There was no established church in the U.S.

Bismarck's relations with the Catholic populations and church in the German Empire in the 1870's were conditioned by the church's hostility to industrialization and secularization of the state. His greatest ally in the struggle to destroy the influence of the Catholic Church was the middle class, while the church found support from the working classes as well as from the aristocracy. Though the *Kulturkampf* waged against Catholicism in the 1870's was cloaked in the guise of German nationalism, it was firmly opposed by the Lutheran Church and by the Prussian aristocracy, who saw it chiefly as a drive toward secularization of the schools and the legal system. (For example, civil marriage was introduced in Germany in, 1872.)

In France, the early Revolution, 1789-95, had been violently anticlerical. Church lands had been confiscated, clergy persecuted, and ecclesiastical privileges removed. Napoleon was more lenient, but his concordat with Rome, 1801, affirmed the French state's control over the church. Attempts to revive the former power of the church during the Bourbon restoration ended with the revolution of 1830. Thereafter, a combination of rejuvenated church thought and the growing social conservatism of the high *bourgeoisie* (especially after the radical popular excesses of 1848) revived the power of the church. By the 1850's the high *bourgeoisie* had become very Catholic.

In opposition to this, there developed between 1850 and 1900 a powerful, militantly anticlerical Freemasonry, drawing its support mainly from the members of the liberal professions (doctors, lawyers, and teachers) and the lower middle classes who eventually formed the Radical Party. In 1886 this group succeeded in having mildly anticlerical laws passed, designed to weaken the Catholic school system. The church issue, however, continued to divide France until the anticlericals succeeded, Dec. 1905, in formally disassociating church and state from each other by using the passions aroused by the Dreyfus case, 1894-99. The power of the French Catholic Church was broken.

In Italy there occurred a similar growth of anticlericalism in the early 19th cent. among the revolutionary middle classes. In the second half of the century the situation was further exacerbated by the refusal of the papacy to accept the political unification of Italy and the elimination of the secular papal state. It was not until 1929 under Italian Fascism that state and church in Italy finally made their peace.

In Great Britain the dominant religious institution was the Anglican Church, which played a powerful political role in the first half of the 19th cent. Typically, Britain handled her religious reform through parliamentary action. In 1828 the old law which prohibited Protestant Nonconformists and Catholics from holding office (the Test Act) was repealed. Nevertheless, the largely middle-class non-Anglican Protestants continued to be excluded from the universities and to be discriminated against by the Anglican aristocracy. Much of the substance of the disagreement between Liberals and Conservatives in the Victorian period (as it had been between Whigs and Tories earlier) was over religion. The former were largely middle- and lower-class Dissenters (or Nonconformists) who fought the power of an official church as the middle class on the Continent fought the power of the Catholic Church. The universities were finally opened to Dissenters, 1871, and nonchurch primary schools were estab-

lished (though not in every part of Britain).

Naturally, these political crises over church-state relations and the weakening of the political power of the official churches furthered the general secularization of values and hastened the decline of religion's influence over everyday life.

BUREAUCRATIZATION AND CENTRALIZATION. The supremely rational management tool is a bureaucracy whose members are chosen and promoted according to their merit (that is, their technical capacity to advance the purposes of the organization). Bureaucracies are specialized into departments skilled in particular facets of organizational requirements. Such an administrative group is effective in all fields from industrial to military to religious organization. Bureaucracy is not an exclusively modern phenomenon, but it is only in the modern period that it has become so widespread.

During the late 18th cent. governments began to undertake vast new tasks. It was necessary to integrate national economies and cultures, to command large armies to preserve national interests against outsiders, and to maintain internal social calm in the face of increasing social dislocations. To fulfill these tasks governments needed better administrations than they had previously possessed.

The earliest model of an efficient government bureaucracy in modern times was the French Revolutionary-Napoleonic structure whose development was much helped by the previous growth of the administration under the old monarchy. It consisted chiefly of some 90 departments ruled by career bureaucrats appointed by the central government. At the center the administration depended on a number of specially trained, technically proficient bureaucrats. Education was similarly reorganized and the French were the first to establish a series of state schools for the training of centrally controlled teaching cadres. Napoleon also greatly increased the size of the permanent police force.

Britain was far slower to develop a centralized bureaucracy because, by comparison with France, its monarchical in-

stitutions had been less centralized. Nevertheless, the British rationalized much of their governing structure during the 19th cent. In 1829 the 1st permanent police force was created in England, largely to control radical mobs. In 1834 central control over the workhouses for the poor was established according to a new set of poor laws (Poor Law Amendment Act). In 1836 government registration of births, marriages, and deaths was begun to help the government keep track of its population. This served government inspectors in enforcing the factory reform laws of the 1830's. In 1835 municipal government was somewhat standardized by parliamentary law (Municipal Corporations Act). Bit by bit local tradition and powers were replaced by central-government authority. Under the Liberal Gladstone government, 1871, the army began to be converted into a modern military machine where before it had been officered by gentry who had bought their commissions. In 1870 the civil service was opened to competitive examination. Before the end of the century the government took in hand a number of welfare schemes to satisfy the demands of the working class. But over all, Britain, save for the U.S., remained the slowest of the industrial powers to bureaucratize itself.

The unique characteristic of the German bureaucracy was the remarkable development of a highly rationalized and efficient army ruled by the bureaucracy of the general staff. The German bureaucracy of the 19th cent. had a particularly high reputation for technical competence.

The bureaucracy of the U.S. grew even more slowly than that of Britain because of the decentralized form of government. It was only in the 1880's that large-scale federal bureaucratization began with the creation of the 1st of the federal administrative boards, the Interstate Commerce Commission, 4 Feb., 1887. Only on 16 Jan., 1883, was civil-service recruitment made competitive and, in some degree, by merit.

But in the U.S., as everywhere else in the industrial world, the habits of bureaucratization spread much farther than

merely into the central government. Big industries, municipalities, and even some political parties came to be run according to the rules of bureaucratic efficiency. This was, however, only an intimation of what was to come in the 20th cent.

ECONOMIC AND CULTURAL INTEGRATION. The entire process of modernization made the various geographic parts of the western nations ever more closely bound to each other. Whereas in medieval times a province could be detached from a state without disrupting the economic life of either, this became increasingly difficult in the 19th cent.

Similarly, local customs and languages (or dialects) and loyalties tended to be increasingly submerged by national language, law, and value systems. Economic interdependence was much helped by the need of industries for mass markets and by the growth of productive capacity. Improved communications also helped. Railways, telegraphs, and mass literacy and the growth of a popular mass press were the instruments of cultural integration as well as of economic. The notion of the "nation," though not a novelty in the 19th cent., was much strengthened.

Conversely, the sprawling multilingual and multinational empires of Eastern Europe (the Austro-Hungarian, the Ottoman, and to some extent the Russian) failed to bind their peoples together, and became ever more vulnerable in face of the more modern powers.

LIMITS OF 19TH-CENT. LIBERALISM. The general rationalization of western society brought a large number of benefits. The standard of living rose to unprecedented heights after the painful beginnings of industrialization. The advantages of science, education, and legal rights were spread to wide sectors of society which had not previously enjoyed them. Religious intolerance diminished. (For example, the Jews were emancipated in France on 27 Sept., 1791, and elsewhere in Western Europe following the Napoleonic conquest.) The political participation of the masses increased. These advantages may be subsumed

under the title "liberalism," and everywhere liberalism's chief standard bearers were the growing middle classes.

But middle-class rationalism had distinct limitations. For one thing, with growing prosperity and success the middle classes in the industrial world began to worry more about the conservation of their advantages than about the spread of these to the less advantaged. In the 2nd place, the fervent nationalism that accompanied the rise of the middle classes turned increasingly into chauvinism. This trend produced the 1st formally racist ideology in history. In France, Joseph Gobineau (1816-82) expounded the doctrine of Aryan racial superiority (*Essay on the Inequality of the Human Races*, 1853-55). In Germany, similar theories were popularized by Richard Wagner (1813-83) in his operas. At first such doctrines appealed mainly to the aristocratic sentiments that opposed the bourgeois revolutions, but toward the end of the 19th cent. their assumptions came to be increasingly adopted by the middle classes.

France, the most middle class of the great European powers, came to be politically dominated by the shopkeeper and small farmer toward the end of the century, and the fear of change felt by these groups slowed down progress in France decisively. Small producers and distributors were consistently protected against their larger and more efficient competitors. This, combined with the lack of population growth, created a stagnant French economy that was surpassed by Germany and the U.S. Of the major industrial nations, France showed the slowest economic growth between 1870 and 1914 (or for that matter, until 1939). In other words, where the lower middle class became too dominant, progress slowed.

Britain and Germany continued to be dominated by an alliance of the old aristocracies and the wealthy industrialists (2 classes that increasingly merged as they intermarried). The U.S. toward the end of the 19th cent. became increasingly dominated by big-business elements, the

1st generation of the great millionaires, Rockefeller, Morgan, Harriman, and others. Where the major industrialists had such control over their nation's economies, they continued to press the expansive industrial growth on which their positions rested.

Though the economies of most of the industrial powers did not fall under the domination of the lower middle classes, the chauvinism of these classes influenced foreign policy. In Britain, at first Disraeli, and then Joseph Chamberlain, rose to power on the nationalism of these elements. Political imperialism and the conquest of colonies was one of the results. This was also the case in Germany, Italy, France, and even the U.S., whose war with Spain carried imperialist overtones.

Toward the end of the century social Darwinism, epitomized by the works of Herbert Spencer (1820-1903) and W. G. Sumner (1840-1910), tended to become popular among the middle classes. This ideology claimed that, as in the plant and animal world, so in the human world, the most capable rise to the top. The most capable were presumed to be the biologically strongest, and therefore, to improve the race, it was necessary to avoid helping the poor, who constituted a weakening element. This sort of reasoning was extended to nationalities. The industrial whites were said to be racially superior to the nonindustrialized peoples outside Europe and the U.S. since the former were materially more successful.

RISE OF WORKING-CLASS MOVEMENTS. It was not the aim of the middle-class revolutions of the late 18th and 19th cents. to absorb the industrial working class or proletariat into national political life or to spread the material benefits of industrialization to it. Indeed, the standard of life of early British, French, and German workers was low. In Orleanist France, for example, the working day in the new industrial cities was 15 hours. Half a man's wages was spent on bread alone. Meat was almost never available. Conditions in Britain were somewhat better by the 1830's, but child labor, low wages, and wretched living standards were

still common. Prostitution, alcoholism, and the other social diseases symptomatic of the bewilderment of uprooted rural folk dumped into the cities abounded. It was reports of these miseries that fueled Marx's revolutionary indignation.

Two sets of factors, however, changed this pattern. First, the increased productivity of industry made it ever more possible to spread material benefits to the workers, and even highly desirable to include them in the rising prosperity in order to expand markets. Second, the numerical growth of the working class, its increased concentration, improved methods of communications, and a higher standard of literacy made it increasingly easier for the working class to organize itself. In the end the threat of violence posed by working-class organizations to the established system at the end of the 19th cent. convinced the higher and middle classes of the industrial nations that it was better to give in to some working-class demands than to face the disruptive effects and possible social chaos that would result from violent confrontation.

Working-class demands were fairly simple: shorter hours, a higher standard of living, the right to form unions and strike, and some sort of welfare scheme to replace the vanished welfare coverage of the rural extended family and to protect workers from the wide economic swings then current.

SOCIALISM. Before the revolutions of 1848 there were intellectual socialist programs, e.g., those of Claude Henri de Saint-Simon (1760-1825), Charles Fourier (1772-1837), Pierre Proudhon (1809-65), and others, several socialist utopian movements (most notably that of Robert Owen, 1771-1858), and a host of proletarian outbursts ranging from that of François Babeuf (1760-97) during the French Revolution to Chartist agitation in England. But these were only weakly organized movements and there were no real socialist parties; not was there much trade union activity, since this was illegal in most of the industrial countries.

The abortive national workshops of

1848 France were the 1st serious attempt by an industrializing nation to guarantee fair and full employment to workers. But the defeat of the far left between 1848 and 1850 by an aroused middle class ended this experiment.

In 1864 the 1st Socialist International convened and was dominated by the theories and personality of Karl Marx (1818-83). In 1871 the Paris Commune proved the disruptive potential of the radical left. But in fact the Commune was largely controlled by the followers of Auguste Blanqui (1805-81) and Proudhon, who were more typically small artisans opposed to industrialization than Marxist industrial workers.

In Germany the 1st socialist movement was led by Ferdinand Lassalle (1825-64) and as early as 1866 it received some encouragement from Bismarck, who eventually hoped to use it against possible middle-class opposition. One of the results of this vague alliance was Bismarck's support for universal suffrage (granted in Prussia in 1866). Though formally Marxist, the German Socialist Party (founded in 1875) had an increasing stake in the system against which it preached as its parliamentary representation rose. In 1877 it received 493,000 votes; in 1884, 550,000 votes; in 1887, 763,000 votes; in 1890, 1,427,000 votes; and by 1912 it was the largest single party in Germany. The German labor class was even stronger than these figures indicate since many of the Catholic workers adhered to the Catholic Center Party.

In France the strength of the Socialist Party also gradually rose. In 1884 trade unions were legalized. In 1899 the socialists participated in a government coalition in Parliament for the 1st time (largely because of their pro-Dreyfus, anticlerical, antiarmy, and anticonservative position). But because of the socialist tendency to co-operate with the system, and despite its formal theoretical Marxism, there developed a split in the French working class between the trade unions and the Socialist Party. The trade unions felt that they were not gaining enough concrete benefits, while the socialists

under Jean Jaurès (1859-1914) took an increasingly moderate tack and limited their activity to parliamentary maneuvering. The anarcho-sindicalist movement that developed from the more violence-oriented trade-union movement in France later formed the heart of the French Communist Party (founded in Dec. 1920).

In 1889 the 2nd International was formed. It too was Marxist, but it was ideologically split between the reformists and the revolutionaries. By organizing workmen's benevolent associations and by providing insurance, cultural activities, and even some schooling for the children of their members, the more successful European socialist parties cooled revolutionary ardor. Although from 1890 to 1914 there were frequent strikes and although the myth persisted of the great general strike that would eventually overthrow bourgeois society, strikes tended to be for short-term objectives and not for ultimate political ideals. In 1898 Eduard Bernstein (1850-1932) proposed that the socialist parties abandon their revolutionary ideologies. His ideas were defeated by the orthodox Marxist Karl Kautsky (1854-1938), but while the intellectual aims of the European socialists remained revolutionary, their actions did not. By 1914 French and German socialists were loyal supporters of their governments and the ideals of proletarian internationalism were quite dead (leading Lenin to denounce Kautsky as an arch-hypocrite and betrayer of Marxism).

BRITISH LABOUR MOVEMENT.

In Britain and the United States analogies could be found with continental Europe except that the labor movements began as gradualist reform movements without passing through a prolonged Marxist revolutionary stage.

The almost unique quality of the British Labour movement was its early association with religion. Nonconformist, primitivist Protestant sects filled many of the emotional and social needs of the British working class, and though these sects were frowned upon by the Church of England, they remained nonrevolutionary and absorbed much of the radi-

calism of the poor. Methodism in Britain grew from 60,000 members in 1790 to about 600,000 in 1850. There were, moreover, other similar sects, though the Methodists were the largest. These sects grew in periods of social and economic turmoil and retreated in periods of stability. For example, the height of Charist agitation coincided with a rapid increase in their numbers. After 1850 their growth was slowed by the amelioration of working-class conditions, but they continued to grow rapidly in the newly industrialized parts of Britain. Thus as trade unions developed (they were legalized in 1824, 60 years ahead of France), their leaders and membership tended to be more religious than their continental counterparts and consequently less Marxist and revolutionary. (On the Continent there was a tendency outside of Catholic parts of Germany for the churches to leave workers alone, and they in turn were largely agnostic.)

In the 1830's and 1840's a series of laws limited child and female labor in British mines and factories and remedied some of the harsher conditions of working-class life. In 1851 the 1st modern trade union, the Amalgamated Society of Engineers, was formed in Britain. It was the purpose of this union to keep itself out of politics and to work instead for the improvement of its members' standard of life. In 1867 some of the working class were enfranchised by the 2nd Reform Bill (Disraeli felt that he could thereby gain the votes of the workers), and in 1884 the 3rd Reform Bill enfranchised almost all the urban workers. In 1883 the Fabian Society was formed by British intellectuals who felt that evolutionary socialism was desirable. In the 1880's unskilled workers were organized for the 1st time and this produced the successful dock strike of 1889. In 1906 the trade unions and the Fabians united to form the Labour Party.

U.S. TRADE UNIONISM. American trade unionism had its roots in the post-Revolutionary and Jeffersonian eras, enjoyed an efflorescence during the 1830's, but really came to maturity after the Civil War. But the Knights of Labor, founded in 1869, and the National Labor Union

included only a small part of the workers of the U.S. As of 1885 the Knights of Labor engaged in a series of strikes that brought them about 700,000 members. In 1886 the American Federation of Labor was formed, but it was more an organization of skilled craft workers than a mass union trying to include all workers. It was also much less radical than the Knights of Labor, who, however, were too loosely organized to survive the reaction that came in the wake of the Chicago Haymarket Square bombing, 1886, attributed to anarcho-Communists.

Although American labor has always been considered reformist rather than revolutionary, and although the most successful of the labor organizations, the A.F. of L., was always antievolutionary, the gains made by American labor in the 1880's and 1890's may in part have been the response to a series of violent strikes: Railway strike, 1877, McCormick strike, 1886, Homestead, 1892, Pullman, 1894, coal strike, 1902. In the 1877 railroad strike federal troops were called in, and the government adopted a hostile posture toward radical unionism. But by the Presidency of Theodore Roosevelt (1901-9), a new attitude emerged. Within a comparatively short time progressive labor measures were adopted. In President Wilson's 1st term, 1913-17, a Seaman's Act was passed, 4 Mar., 1915, and child labor was prohibited by Congress, 1 Sept., 1916—though this act was later declared invalid by the courts. By the Clayton Anti-trust Act, 15 Oct., 1914, labor received the right to organize itself, to strike, and to demand collective bargaining.

The partial success of working-class movements in the West up to 1914 legitimized labor organizations and brought certain benefits to the workers. It did not yet lead to what has since become known as the welfare state. By accepting the 1st demands of the working class, however, western societies blunted the revolutionary potential of the labor movements. This was made possible only by the ever rising productive capacity of the industrial economy which made it easier to spread material benefits to all.

THE INDUSTRIAL SOCIETIES, 1914-55

THE EVE OF WORLD WAR I. Between 1890 and 1914 it began to seem as though the industrial countries were entering a period of great stability. The struggle between aristocracies, bourgeois, workers, and peasants was ending. In Germany and Britain the old aristocracies had survived, but they had accepted, though in different ways, industrialization and were merging with the richer industrialists. The middle classes were content with their prosperity, and even the working class had been sufficiently pacified to blunt its revolutionary impact. In France the coalition between the bourgeois and the prosperous farmers and peasants found a new stability following the resolution of the church-state conflict of 1905. Even the radical labor unions were less anarchistic by 1910 than before. In the U.S. the pacification of labor had begun and the reforms of Theodore Roosevelt and Woodrow Wilson had largely placated the populist progressives.

In the nonindustrial world the western powers and Japan had political or economic control. It was only in Eastern Europe, in the Balkans, in the Ottoman Empire, and in Russia that there seemed much potential for instability.

WAR CASUALTIES. World War I destroyed the illusion of tranquillity. The casualty figures alone reveal the extent of the blow, though they cannot measure the moral and economic shock.

APPROXIMATE NUMBER OF DEATHS DURING THE WAR DUE TO FIGHTING, 1914-18

Germany	1,900,000
Russia	1,700,000
France	1,400,000
Austria-Hungary	1,000,000
U.K.	750,000
Italy	500,000
Turkey	400,000
Serbia	400,000
U.S.	115,000

Counting both deaths and serious injuries, the French casualty rate was 25%

of the total army. For Serbia, Russia, Germany, and Austria-Hungary, these rates were higher. Death on an appalling scale and the accompanying privations brought old social systems into question. All the major losers went through subsequent revolutions (Germany, Austria-Hungary, Turkey, and Russia, which may be regarded as a loser despite its support for the eventual victors from 1914 to 1917).

POSTWAR GERMANY. During the last 2 years of the war, Germany fell under the total control of the army general staff. Imminent military collapse, Nov. 1918, provoked a revolt in the army and navy among tired and disillusioned soldiers. On 9 Nov., 1918, the German emperor abdicated and the war ended 2 days later.

The Weimar Republic which followed had the general support of the moderate socialists, the Catholics, and most of the middle classes, but it never destroyed the pre-eminence of the big industrialists, of the landowning Prussian Junkers, or of the army. From 1919 to 1923 the government had to rely on the army to crush revolts from the right and left (among them Adolf Hitler's attempted Nazi coup of 8-9 Nov., 1923). By 1922 the German economy had not yet recovered from the war because of the continued occupation of the Rhineland and because of the heavy reparations payments it had to make. From 1918 to Jan. 1923, the value of the German mark deteriorated from a rate of 4 marks to U.S. \$1 to over 7,000 to \$1. By 1 Nov., 1923, the rate had fallen to 130,000,000,000 marks to \$1. While the holders of real property did not suffer, especially those with debts, the middle and lower classes had their savings wiped out. As small businesses collapsed, unemployment rose, and a general depression began. These events so frightened and demoralized the middle classes that they began to turn increasingly toward the radical right, while significant numbers of workers became Communists. From 1924 to 1929 there was a recovery, but the army, the landowners, and the industrialists continued to fear a Communist takeover and thus financed right-wing antidemocratic forces. The depres-

sion of 1929 precipitated a new crisis of confidence.

FRANCE IN THE 1920's. France did not suffer the kind of collapse that occurred in Germany. On the contrary, the illusion of stability and prosperity prevented the necessary rationalization of an economy that was retaining too many small family firms operating inefficiently behind a wall of tariffs. War losses seriously aggravated the population problem, and the birth rate remained too low. Only through immigration from Eastern Europe did France manage to keep its population from declining. But the average age of the population increased, and this strengthened the social conservatism of the government. Furthermore, the influx of immigrants served to reawaken the chauvinism and anti-Semitism of the 1890's.

BRITAIN IN THE 1920's. The end of the war opened a period of economic depression in Great Britain, from which it did not really escape until the late 1930's. From 1919 to 1921 there was a series of labor strikes which almost produced a general strike. In Glasgow, Jan.-Feb. 1919, the army was used to put down a Communist-type workers' revolt. Despite the Housing Act of 1919 and the Unemployment Insurance Act of 1920, the social situation remained tense. In 1926 there was a 9-day general strike in response to a new economic slowdown produced by the government's attempt to preserve the pound sterling at its old value. The strike failed because it could not gain middle-class support, but its failure did nothing to solve Britain's problem, arising from its loss of its leading industrial position to the U.S., Germany, and Japan, which had captured many of its foreign markets.

U.S. IN THE 1920's. Of the major participants in World War I, the U.S. was hurt least. Between 1923 and 1929 there was a spectacular economic boom. In 1919 there had been 65 automobiles for every 1,000 people; in 1929 there were 200. Union membership declined. Increased wealth and the loosening of social

restrictions (especially for women) produced a spirit of general buoyancy. The 1920's saw vast proliferation of those archetypal Americans, the salesman and the advertiser, whose task it was to convince the population that they needed the ever-growing number of consumer goods being produced.

There were, however, problems produced by this very success. On 16 Jan., 1920, the sale of alcohol in the U.S. was prohibited (the Volstead Act). Americans did not, however, stop drinking liquor. Instead, the liquor industry was replaced by highly organized, and criminal, bootlegging operations. In the 13 years that followed, not only did a large proportion of Americans knowingly violate the law, but the big crime syndicates established themselves so solidly that even after the end of prohibition they remained strong by branching out into other illegal activities such as narcotics and gambling. The hypocritical complacency engendered by prohibition was generalized into a lack of concern for social and economic reform and an excessive glorification of business values. It also produced a wave of antforeign chauvinistic nationalism. Radical aliens were deported, socialists were persecuted, and the Ku Klux Klan (originally created in the South in 1867 as an anti-Negro organization) came back to life as anti-Negro, anti-Semitic, and anti-Catholic.

One sector of the economy, agriculture, went into a depression after World War I. By 1929 a crisis in overproduction was spreading to all parts of the economy. This was accompanied by frenetic, unregulated stock-market and real-estate speculation. In Oct.-Nov. 1929 there was a stock-market crash. The credit structure of the U.S. tumbled. Since America had accumulated large short-term investments in Europe, it withdrew them to compensate. The economies of the rest of the industrial world quickly followed the American one into depression.

UNEMPLOYMENT. By 1932-33 the unemployment problem had become severe in most of the industrial countries.

APPROXIMATE UNEMPLOYMENT FIGURES,
1932-33
,(million)

U.S.	15.0
Germany	6.0
U.K.	3.0
France	0.5

The nonindustrial countries also suffered as the prices of their exports fell drastically. Only the Soviet Union, which had withdrawn from the world economy, remained largely untouched.

There were 2 broad types of response to the depression, the fascist and the democratic.

RISE OF FASCISM. Fascism triumphed in those countries that had retained powerful antidemocratic landowning aristocracies. European fascist movements, however, were not exclusively or even mostly aristocratic ones. They tended to get their mass support from the lower middle classes for whom depression meant ruin. Fascism was fed by the middle and upper classes' fear of socialist or Communist takeovers. Since unemployed workers gravitated toward the radical left, the depression everywhere increased this fear. The combined agrarian and petty bourgeois bent of most fascist movements produced a paradoxical ideology that was both antilabor and anti-big business. To reform crisis-ridden societies, fascists from Japan to Spain promised a return to the "old agrarian virtues," the curbing of big capitalists, and the purification of the nation from "evil foreign influences." (By these they meant liberals, Jews, Reds, bankers, and/or anarchists.) The fascists promised to replace the unregulated, chaotic, too individualistic, and too strongly competitive quality of modern life by a regulated corporate society in which guildlike occupational groupings would take care of their members, protect them, and represent them in the state. Thus democracy could be replaced by the corporate state.

In practice fascist ideology tended to break down when it achieved power because of the practical impossibility of implementing its programs. Since fascists

came to power largely with the support of fearful elites, fascist governments continued to support these elements once in power. But in industrial countries the big industrialists were too important a part of the elite to allow an anti-big-business program to develop; moreover, industrial output was a vital part of national strength, and a simple return to an agrarian past was out of the question. Instead of becoming real corporate societies, most fascist countries simply turned into repressive police states helping to keep the rich safe from the poor.

ITALY UNDER MUSSOLINI. The 1st fascist government was created before the depression in Italy. Benito Mussolini (1883-1945) organized fascist youth groups in 1919 to fight in the streets against Communists and unionists. Italy's slow economic recovery from the war led to numerous workers' strikes, 1919-22, as well as to serious incidents of agrarian violence. True to form, the frightened middle and upper classes responded by contributing to Mussolini's growing strength. With the help of the king of Italy, Mussolini came to power on 29 Oct., 1922. In 1925 all parties but the fascists were made illegal. Mussolini, however, substituted public-works programs and an extremist nationalist policy for real social reform. Though Italy's economy never achieved the desired level of prosperity, Mussolini's regime managed to achieve wide popular support and maintain social and political stability until World War II.

EASTERN EUROPE. In some of the less industrialized European states semi-fascist governments also came into power in the 1920's. In Hungary the Communist revolution led by Béla Kun (1885-1937) produced a fascist reaction. The regime of Adm. Miklós Horthy (1868-1957), however, was more purely of the agrarian elite than Italy's. In 1930 a few hundred families owned over 85% of Hungary's land. In Poland there was a military coup in May 1926 which brought a similar type of regime to power.

Other Eastern European countries had weaker aristocracies and thus had more

or less effective land reforms. But as Germany regained its economic power in the 1920's and 1930's, the nonindustrial Eastern European countries (and Czechoslovakia was the only well-industrialized one) became increasingly dependent on it. They exported their agricultural produce and raw materials to Germany in return for industrial products, and Germany came to dominate their economies as if they were colonies. This facilitated the rise of fascism, particularly in Rumania and Austria.

PORTUGAL AND SPAIN. In 1933 a fascist corporate state was declared in Portugal, and after a bloody civil war (1936-39) Spain also became a fascist state. These, however, were more agrarian than industrial fascist regimes.

GERMANY UNDER HITLER. Though much more industrialized than Italy, Germany still had a landed aristocracy, a powerful antidemocratic army and bureaucracy, and, most significant, an insecure, disillusioned middle class which had hardly recovered from the financial collapse of 1923 when it was hit by the depression of 1929. Since the working class seemed to be going increasingly Communist, the Nazi Party of Adolf Hitler (1889-1915) gained many adherents from the middle classes. Using the example of Mussolini's fascist toughs of the early 1920's, Hitler created the Brown Shirts (Storm Troopers). By early 1932 there were 300,000 of these (many of them unemployed men), forming a private Nazi army. In 1930 and 1931 in a series of private meetings with German industrialists, Hitler raised much of the money necessary to finance his party. In 1932 he gradually won over the Junker and officer aristocracy by posing as the only bulwark against Communism. On 30 Jan., 1933, after important electoral successes, he came to power. On 23 Mar. (Enabling Law) he received absolute power.

In their drive to power, the Nazis had created not only their own army but also their own administrative structure parallel to the state's. This machinery moved rapidly to take control of Germany after

Hitler's accession to power. The semi-decentralized federal structure was dismantled and replaced by full centralization, Jan. 1934. Earlier the Nazis had begun implementing their anti-Semitic policy by removing all state bureaucrats from office if they were Jewish, Apr.-July 1933. All cultural activities were placed under the party, 22 Sept., 1933. In Mar.-Apr. 1934 trade unions were destroyed.

But in the 1st year of Nazi rule they developed a split between the mass revolutionary Nazi movement (whose power base was the Brown Shirts) and the more pragmatic Hitler. The radical Nazis aimed to eliminate the big capitalists as well as the aristocratic elements of the officer corps. Hitler wished to avoid such social upheaval, which might have seriously weakened Germany. On 30 June, 1934, the radical wing of the Nazi Party was violently purged, much to the relief of the German conservatives.

Hitler, however, was not a simple puppet of the old-line conservatives. He continued to move toward the elimination of every independent organization in Germany and to make the entire society subservient to the party. The Christian churches were restricted. A secret police, the Gestapo, placed its agents everywhere to root out subversion. The introduction of so many young Nazi officers amounted to a virtual take-over of the army (thus, on 20-21 July, 1944, when the officer corps tried to overthrow Hitler, it was easily defeated and much of the old Junker high-officer caste was liquidated). In Sept. 1936, Hitler proclaimed a 4-Year Economic Plan which put German industry directly under party control. By that time the Nazi regime had become as "totalitarian" as the contemporary Soviet Russian regime.

TOTALITARIANISM. Dictatorship was not a new phenomenon in history. But until the 1920's and 1930's it had not been technically possible for any state to assume such thorough control of all levels of society. It was only with modern mass communications that there could be the possibility of ever present mass indoctrination. Only a highly efficient bureauc-

racy could control so many details. This effective control over the totality of German life was what distinguished German fascism from other European fascisms, even Italian fascism, since these had arisen in far less efficient and industrialized societies.

FRANCE IN THE 1930's. Those countries that lacked reactionary military and quasi-feudal elites did not turn to fascism during the depression. In France, it is true, a host of fascist movements developed, of which the Cagoulaards (hooded men), the Patriotic Youth, Jacques Doriot's French Popular Party, and the older Cross of Fire were the most important. Doriot's party actually achieved a membership of some half-million at its height in the late 1930's. But unlike Italy, there was no French monarchy to help the fascists into power. Nor was there a Junker class, a hereditary officer caste, or even an antirepublican bureaucracy. The monarchists (chiefly in the Action Française) remained a risible minority of reactionary youth who never played an important role. (It was only the German occupation between 1940 and 1944 that permitted a fascist regime to establish itself in France.)

France's early response to the depression was to seal itself off from the outside world by tariffs, to maintain price supports, and to discourage industrial competition. This kept France safe until 1931-32, when the cheapness of foreign products made it impossible for France to sell goods abroad. Even then unemployment remained low compared to Germany, Britain, or the U.S. Conservative economic policies remained in force until 1936, and prevented a rationalization of the French economy.

In May 1936, the Front Populaire, a leftist coalition of Socialists, Communists, and Radicals (which in France meant moderates), came to power. The Front quickly passed a series of labor reform bills. A 40-hour workweek was instituted. But the economy itself was neither overhauled nor primed by heavy government spending and, predictably, it remained stagnant. The demoralization of France

produced by this stagnation, its declining strength vis-à-vis Germany, and its insistent social and economic conservatism (popular and moderate as it was) led to its startlingly rapid defeat by Germany in 1940.

BRITAIN IN THE 1930's. Great Britain responded to the depression by reversing its century-old free trade policy in 1932. But since there had been a Labour government in power at the start of the depression, the election of 1931 brought a Conservative victory. Britain thus did not engage in a wholesale program of reform to overcome the depression, and it was not until rearmament for World War II began that, in the late 1930's, it regained its prosperity.

U.S. IN THE 1930's. Of the major western democratic nations, the U.S. carried out the most ambitious program of social reform in response to the depression. The New Deal, as this reform program was called, did not really end the depression (that had to wait until the heavy spending put into rearmament from 1939 on), but it did restore domestic tranquillity and confidence in the government. It also ended many of the most glaring social injustices.

An outstanding feature of the New Deal and of New Deal legislation was the increase it entailed in the activity of the federal government. After Roosevelt's accession to power, 4 Mar., 1933, a flood of federal legislation consciously attempted to correct social injustices and improve the lot of the underprivileged. Acts of Congress and of the executive reformed banking, securities trading, and the currency, created jobs for the unemployed, and regulated housing, agriculture, wages, labor relations, trade unions, pensions, insurance, and taxation (p. 445). Though highly unpopular among many of the affluent in the U.S., these measures saved the old social system by reforming it.

THE ROOTS OF SOCIAL INSTABILITY. Industrialization continued the differentiation and rationalization of society which had started in the 18th and 19th cents. But by 1930 there remained large parts of society for whom new

integrative bonds had not yet evolved to replace traditional ones. One indication of the decay of old social bonds was continued urbanization. Another was the continued disintegration of traditional extended families and their replacement by more upwardly mobile, smaller families. The birth rate continued to fall (except for a momentary upward spurt after World War I), and this movement was accelerated by the depression.

FEMINIST MOVEMENT. Yet another element of social change was the new role played by women. Rather than remaining in the traditionally subordinated roles which they had held, some women began to compete with men in political and economic life, a process accelerated by the use of women in factories during World War I. Though the pattern changed slowly for the majority of women (in the 1960's men still held almost all superior positions), there were certain dramatic legal changes such as the extension of the right to vote to women (1918-20 in the U.S., Britain, and Germany, but not until 1915 in France and Japan).

INCREASE IN GOVERNMENTAL ACTIVITY. All these continuing changes increased the problem of the individual's isolation from larger social units which could support him in times of trouble. This made individuals feel more vulnerable to the complex and distant forces that shaped their daily life. In every industrial society in the 1930's, strong pressures arose for increased government action. Were there no longer any extended families to care for the old? Then the government must do it. Did stock-market speculation bring unemployment? The government must regulate it. And indeed central governments were the only agencies that could effectively deal with the intermeshing world economic and social problems before which local associations were dwarfed.

Government action was not enough. The uprooted also sought to form their own associations for protection and companionship. These tended to play into the hands of political parties which could use them for their own purposes. Thus workers' associations fulfilled more than

political purposes, but they also provided a main base of support for various leftist parties. Early fascist movements were coalitions of similar types of groups. The logical extension of this search for new groupings was the over-all attempt to organize men's lives in the totalitarian states, and it was the need for new organization that allowed totalitarianism to succeed. In countries where economic and social change was sufficiently gradual to allow older associations and groupings to survive, there was less need for government involvement.

WORLD WAR II CASUALTIES.

World War II surpassed all previous wars in total casualties. It was at once a racist war (of Germans against Slavs and Jews, of Japanese against whites), an ideological war (of fascism against all other systems), an economic, and a nationalistic war. Technical efficiency made mass slaughter possible, and also involved larger proportions of populations than in any previous war.

MILITARY AND CIVILIAN DEATHS, WORLD WAR II

USSR	20,000,000
Poland	6,000,000 ^a
Germany	5,000,000 ^b
China	1,300,000 ^c
Japan	1,800,000
Yugoslavia	1,600,000
France	540,000 ^d
Rumania	460,000
Italy	450,000
U.K.	420,000
Czechoslovakia	415,000
Austria	380,000
U.S.	350,000

^a Incl. c. 3,000,000 Jews.

^b Incl. c. 1,100,000 civilians.

^c Military deaths only; civilian casualties were much more numerous.

^d Incl. c. 330,000 civilians.

RISE OF COMMUNIST POWER.

Communists played a leading role in many European resistance movements which arose against the Nazi occupation. This was because the prewar Communist organizations had better prepared their

members for clandestine operations than had other political groups. In Yugoslavia the Communists emerged as the only ruling force after the war. In Greece, Italy, France, Czechoslovakia, and Poland they became important components in the postwar political balance. Where the Soviet army could directly assist them, as in Eastern Europe, they took power. Where it could not, they nevertheless remained significant as the representatives of the working class and poor peasants (most notably in France and Italy). In Greece they were defeated in a civil war.

SOCIAL CHANGE IN THE POST-WAR YEARS. In Britain, war suffering created pressures for social reforms. In 1945 the Labour Party took power after winning an overwhelming victory at the polls. A National Insurance Act, 1946, and a National Health Service Act, 1946, were passed and went into effect in 1948. A series of nationalizations of major industries took place. Britain thus became a welfare state (pp. 519, 817-818).

The shock of the 1940 defeat in France and the victory of the Resistance movement against the Vichy government in 1944 had a major effect. Economic planning and rationalization were pushed. Coal, gas, and electric industries were nationalized as well as the largest deposit banks and insurance companies. The social-security system was enlarged. Even the pattern of demographic decline was somewhat reversed by an increased birth rate. Between 1946 and 1958 the 4th Republic ruled over the greatest economic expansion known to France since the 1850's. Many of the old problems remained, however, particularly because of a failure to achieve sufficient concentration of industry through large firms, the persistence of too many small shopkeepers and peasants, and the relative stagnation of southern France. These problems manifested themselves in political instability and persistent hostility between labor and management which helped the French Communist Party to remain strong.

German society was profoundly changed

by the war. The Prussian landowners disappeared as their lands were occupied by the Communists. The officer caste (largely decimated by Hitler during the war) went with them. Great prosperity after 1949 discouraged any return to fascism.

Defeated and occupied Japan went through a similar social transformation. The landowners were expropriated by the land reform of 1946. The democratization of Japan, however, did not curb the growth of the *zaibatsu*, who participated in an industrial boom (which made Japan the world's 3rd largest industrial power by 1969). From 1945 to 1955 Japan went through a large-scale modernization which spread the benefits of the economy to the population and brought her into the ranks of the high-mass-consumption industrial nations.

Eastern Europe had entered World War II as a semicolonial area of big landowners. Communist rule decisively broke this pattern; however, it was not enough to do away with landlords. Full modernization presupposes the tightening of internal links within a society and the relative decrease of dependency on outside powers. Until the mid 1950's the Soviet Union acted as a sort of colonial overlord in Eastern Europe. After this period, however, an internal liberalization of East European regimes occurred (with notable exceptions and reversals), accompanied by increasing independence from Soviet domination. Rumania's refusal to adhere to Russia's demands in 1966 that it delay industrialization to continue exporting agricultural and mineral products marked the formal recognition in Eastern Europe that modernization there had to take a path roughly similar to that earlier followed in the West.

By 1955 Soviet Russian industrial production was from 2 to 3 times greater than in 1940. But successful industrialization brought with it the same demands for liberalization which had previously taken place in the West. The managerial class created in the 1930's to run the economy was opposed to irrational police-state methods which put a higher pre-

mum on political behavior than on technical efficiency. Stalin's death, 5 Mar., 1953, stopped a planned attack on this growing source of protest. His successors pursued for a time the more rational line of liberalization and a softening of police methods, accompanied by a drive to increase consumer goods and raise the low standard of living. How significantly these reforms have stabilized Soviet society has not been tested in crisis.

THE NONINDUSTRIAL SOCIETIES, 1760-1968

THE SOCIAL ORDER IN THE COLONIAL WORLD. Except for a few peripheral European communities in Canada, Australia, New Zealand, and South Africa (which were not industrialized but whose populations already had semimodernized social structures), the world outside Europe and the U.S. was neither much industrialized nor modernized (with the partial exception of Russia and Japan) before the 20th cent. (p. 740). There was neither the large-scale differentiation and rationalization of society nor the tight integration of states which characterized western nations. The economies of the nonindustrial societies were poor and the middle classes small. Malintegration of these nonmodernized areas left them vulnerable to western interference, which was able to play on regional, political, and cultural differences. Their technological backwardness left them open to economic and military domination by the West. This and the West's aggressiveness produced the age of modern colonialism.

Despite wide differences between the various colonies and semicolonies that arose in Asia, Africa, and Latin America between 1760 and World War I, a general model may be described for them since they shared many characteristics.

Where there was actual domination from the outside (imperialism) rather than commercial exploitation only, some form of cash taxation was imposed on the local population to pay for administration. Taxation often forced peasants to

grow cash crops, since they needed money to satisfy the new government's demands. In all colonies the production of cash crops and mineral products which could profitably be exported to the home and other markets was pushed. Everywhere the effect was to discourage the growth of local manufacturing and to strengthen the position of native landowners—unless they were too poorly organized to produce the desired commodities or were expropriated by Europeans. In some areas, e.g., in India, a whole new class of landowners was created. Elsewhere, e.g., in coastal China, a class of middlemen (compradors) used their commercial profits to buy land and transform themselves into a new landowner class which partially replaced the traditional aristocracy. Nearly everywhere, however, native artisans and putative manufacturing middle classes were destroyed or prevented from getting any kind of start.

With colonialism came an improvement in internal communications. This permitted large-scale population migrations which had not before been possible. There developed large commercial and administrative cities, usually along the coasts. The demand for labor in these cities attracted young men from the interior who came to earn tax money and to partake in the pleasures of "modern life." Thus in most colonies and semicolonies there was a rapid growth of cities which were not, however, in most cases manufacturing centers. Urbanization and the growth of a class of uprooted peasants living in cities eventually proved to be major stimulants to revolt against western authority.

European schools were started, either by missionaries to win converts or by administrations to train low-level help. At first the products of these schools in Asia and Africa were docile supporters of the colonial regimes, but as they gradually discovered that impassable race barriers blocked the advancement of "natives," they became leaders of the nationalist, anticolonial protest movements.

The colonizers frequently supported landowners and traditional authorities who shared in the profits of colonial-

type economies, but these tended to be the most conservative elements in their societies. The more modernized, western-educated subjects of colonial regimes naturally opposed these conservative elements who not only served as the tools of imperialism but simultaneously opposed internal modernization.

THE REVOLUTION OF RISING EXPECTATIONS. With the breakup of the European colonial empires after World War II, a host of newly independent states emerged in Asia and Africa. All professed modernization as their goal,

but few were able to establish a social order conducive to achieving it. A major source of instability was rapid urbanization. Traditional village and family ties were broken, and individuals were thrown into less secure environments. In consequence, they sought out and created new organizations for moral and economic support. Their requirements were fulfilled by a wide variety of radical political parties as well as by new unions, churches, and other associations. The rise of socialist parties in 19th-cent. Europe may be seen as an analogous development. But whereas the revolutionary potential of the European socialists was blunted by increasing prosperity, the non-industrial world of the mid-20th cent. developed radical mass parties before the onset of industrial maturity. This has

made the satisfaction of radical demands unrealistic.

In 19th cent. Europe, moreover, economic and medical advances lowered the death rate. But within 50 years after the drop in death rates, birth rates also began to drop as increased prosperity and social mobility induced people to have fewer children. In the nonindustrial world of today, however, medical advances imported from the West have reduced the death rates while birth rates have remained very high. Thus population growth has been rapid even though industries have not grown to absorb the extra manpower.

Mobilization for nationalist and modernizing revolutions has increasingly led the masses to demand equality. This has forced leaderships to promise ever greater

rewards to maintain popular support. (This double phenomenon is what is often called the revolution of rising expectations.) But the leaders find it ever more difficult to maintain the tight social discipline and economic austerity demanded by early industrialization. Thus a vicious circle has developed of promises followed by disappointments. The resulting instability, with leaders' attempts to put the blame for failure on outsiders by encouraging rabid jingoism, has favored the rise of military regimes which alone have the power to control their populations.

A further problem has been the very existence of highly successful industrial nations. To be sure, these can transfer technology to less favored countries, but they are also a source of almost insurmountable competition in world markets. This has made the development of internal industries increasingly difficult for nonindustrial countries.

Finally, Western Europe, the U.S., Russia, Japan, and China all entered the modern age as fairly coherent cultural units with old intranational links. Most

new Asian and African states have not enjoyed a similar advantage.

WORLD POPULATION, 1760-1968

TOTAL POPULATION AND DISTRIBUTION. Between the mid-18th cent. and the present, world population has increased more than 4-fold (see Table I). The distribution of world population altered as indicated on Table II.

POPULATION GROWTH. There has been an acceleration in the rate of the world's population growth (see Table III). While the growth of population has occurred in less developed areas of Asia and Africa as well as in areas of European settlement, the rate of growth has been greatest in the areas of European settlement (see Table IV). In the 20th cent. the rate of growth in Africa exceeded the world rate (see Table III). Between 1950 and 1965 the rate of growth in Asia exceeded the world rate (see Table VI). The rate of growth in less developed areas surpassed that of industrial countries.

BIRTH RATES. Good data are not available to measure the birth-rate pat-

veloped countries, with few exceptions, were characterized by high birth rates. Birth-rate figures for poorer countries are incomplete, but from c. 1920, onward there seems to have been the same general decline in the birth rate in poorer countries (as they improved their well-being) as there had been in the case of the leading industrial nations in earlier years. The decline was a slow one.

DEATH RATES. Good data are not available to measure the death-rate pattern worldwide. Table VI summarizes some of the available historical information.

In the leading industrial nations, death rates declined steadily. Evidence for the

death rates in most poorer countries in the 18th, 19th, and early 20th cents. is not available. Figures given by Carr-Saunders indicate a rise in death rates in India, 1885-1900. Between 1900 and 1917 death rates in India fluctuated. Because of severe crop failures, causing starvation, and because of the influenza epidemic, death rates in India soared in 1918. An estimated 5 m. deaths occurred in India during 1918-19. In some less developed countries the death rate rose during 1920-40 (see Table VI, data on Egypt); in other countries, the death rate declined (see Table VI, data on Chile and India). From 1910 onward there was a sharp drop in death rates in poorer nations, as

modern medicine, sanitation, and disease control had their effect.

NATURAL INCREASE IN POPULATION. The figures in Table VII do not reflect the change in population in these countries because they do not take into account international migration. The rate of increase in the U.S., 1790-1800, was due to an extraordinarily high birth rate (see Table V). Natural-increase figures rose sharply, 1960-64, in the UAR, Chile, and India because of sharply falling death rates (see Table VI).

INFANT MORTALITY RATES.

From the decade of the 1890's onward, infant mortality rates, in every country in Table VIII, except USSR and India, show a steady and drastic drop. The Soviet rates show a steady drop, except for the World War II years; the Indian rates show an upward turn during 1941-51, but this may be due to changes in the statistical series. There seems ample evidence of a general sharp drop in infant mortality from the late 19th cent. to the mid-20th. Progress in medicine and sanitation plus

better nutrition and standards of living cut down infant mortality just as such progress lowered the death rates.

LIFE EXPECTANCY AT BIRTH.

The period shows a steady increase in life expectancy at birth. In 1875 life expectancy at birth in England and Wales was only 41 for men and 45 for women; in India it was 25 for both sexes. By the 1960's, in industrial nations, the life expectancy at birth was 67 to 71 years for men and 73 to 76 years for women. In India, 1950's, the life expectancy at birth was 42 years for men and 40 for women.

AGE COMPOSITION OF THE

POPULATION. The data on age composition reflect the aging of western populations since 1850. The aging population, so in evidence among western populations was not yet apparent, 1950, among Latin American and Asian populations.

MIGRATION. During the past 2 centuries there has been a tendency worldwide toward greater mobility of population. After c. 1820 the world's main recipient of immigrants was the U.S. Emigration from Europe provided the bulk of U.S. immigrants.

The Expanding World of Education

The revolution in education which has occurred during the past 2 cents. can be construed in 3 broad and overlapping phases: (1) the rise of massive publicly supported systems of education in the West, (2) the spread of western ideas about education to nonwestern peoples, and (3) the creation of a world educational community.

THE RISE OF PUBLIC EDUCATION IN THE WEST, 1750-1914

THE CONCEPT OF PUBLIC EDUCATION. In feudal Europe education

tended to be a privilege of the aristocracy and the preserve of the church. During the Renaissance, however, formal education became more secular in nature and more widespread in application. Nevertheless, it remained for the 18th-cent. Enlightenment to stress the democratic idea that education was the right of all men, and for 19th-cent. nationalists to emphasize the republican idea that education, since it was a necessity if a nation was to grow economically and preserve its integrity militarily, was the concern of the state. During this period the role of the church in education progressively

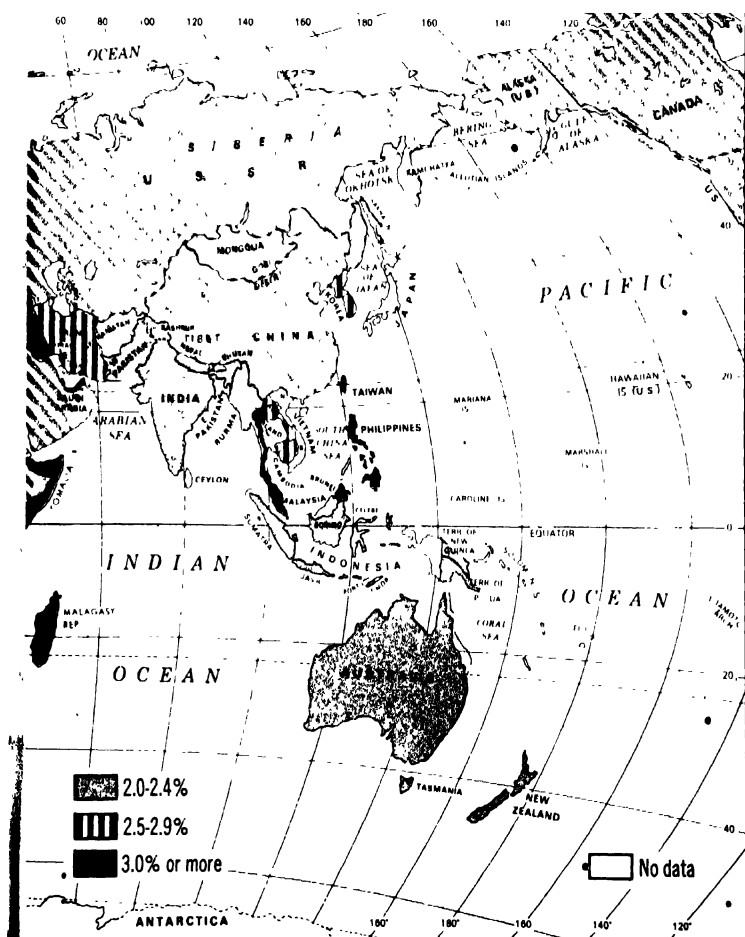

diminished, and the classical curriculum, which formed the basis of training for the feudal nobility and those who served it, was de-emphasized in favor of more popular and utilitarian studies.

RUSSIA. Russia was the 1st major European power to begin setting up a state-controlled system of education. As part of his scheme of modernization, Czar Peter the Great (ruled 1689-1725) called for the construction of state schools so that Russia's need for government administrators and military officers could be met. In 1701 he crowned his fledgling school system with the Moscow School of Navigation and Mathematics (now the Naval Academy). In 1755, the University of Moscow was founded. Under Catherine the Great (ruled 1762-96), the Russian state education system received a great impetus. Her Statute of 1786 ordered

that (1) government primary schools be created in district and provincial towns; (2) religion should be taught only in the lower 3 years of those schools; (3) the study of Latin should be de-emphasized in favor of subjects more useful to the state; and (4) the state system should be free and open to all, including serfs. Catherine's educational schemes were greatly extended during the reign of Czar Alexander I (ruled 1801-25), whose Statutes for Vilna, 1803, and the Russian Provinces, 1804, reflected a Utilitarian's concern for education, and whose Ukase Law of 1809 declared that educational attainment be made the key criterion for governmental appointments. Three universities were built during Alexander's reign: Kharkov, 1804; Kazan, 1804; and St. Petersburg, 1819.

Public education suffered a reversal at

the hands of Nicholas I (ruled 1825-55). Frightened lest vast numbers of serfs be allowed to rise above their stations in life, he promulgated a statute, 1827, which effectively barred them from higher education and re-emphasized the importance of an aristocratic curriculum of Latin and Greek. In 1861, however, the serfs were emancipated and all educational restrictions were removed from them. In reaction to the assassination of Alexander II, Alexander III (ruled 1881-94) suspended all educational reforms and embarked on a plan of Russification. His Decree of May 1887, which made the Russian language obligatory in all schools, was specifically aimed at the Baltic provinces, where (especially at Dorpat University) German was in vogue. Alexander

III's reign was further marked by the efforts of the procurator of the Holy Synod, K. P. Pobedonostsev, to turn the state system into a parochial one, and of the minister of public instruction, T. D. Delyanov, to return to the elitist system of Nicholas I. Such reactionary schemes were countered when the Duma was created in 1906. The ill-fated Nicholas II (ruled 1891-1917), however, turned a deaf ear to most proposals for educational reform, thus making the Revolution of 1917 all the more inevitable.

GERMANY. Certainly the most influential and emulated educational system of the 19th cent. was that of Prussia, whose 1st educational advances came during the reign of Frederick William I (ruled 1713-40). In 1717, he ordered all children of

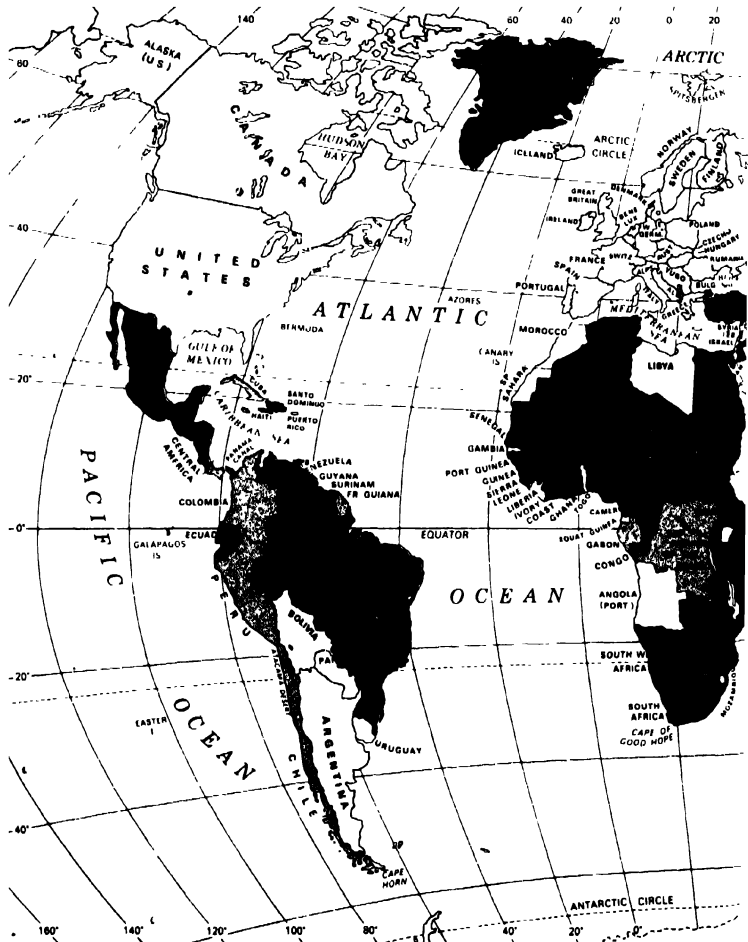

Friedrich Froebel (1782-1852), the founder of the Kindergarten) were profoundly influenced by the ideas of the Swiss educator Johann Pestalozzi (1746-1827), who was in turn influenced by Rousseau's ideas of a natural education.

The events of 1870-71, coupled with Germany's rapid industrialization, caused Germans to re-examine and reformulate their educational policies. The nation's major educational struggle lay between champions of a classical secondary-school curriculum and advocates of a more scientific and nationalistic course of study. Despite the fact that Germany needed more scientists and despite the pronouncement of Kaiser William II at the 1890 Education Conference ("It is our duty to educate young men to become young

Germans and not young Greeks and Romans"), the classics retained their social and academic prestige. Not until the Educational Conference of 1900 was a workable truce arranged between the classicists and the modernists.

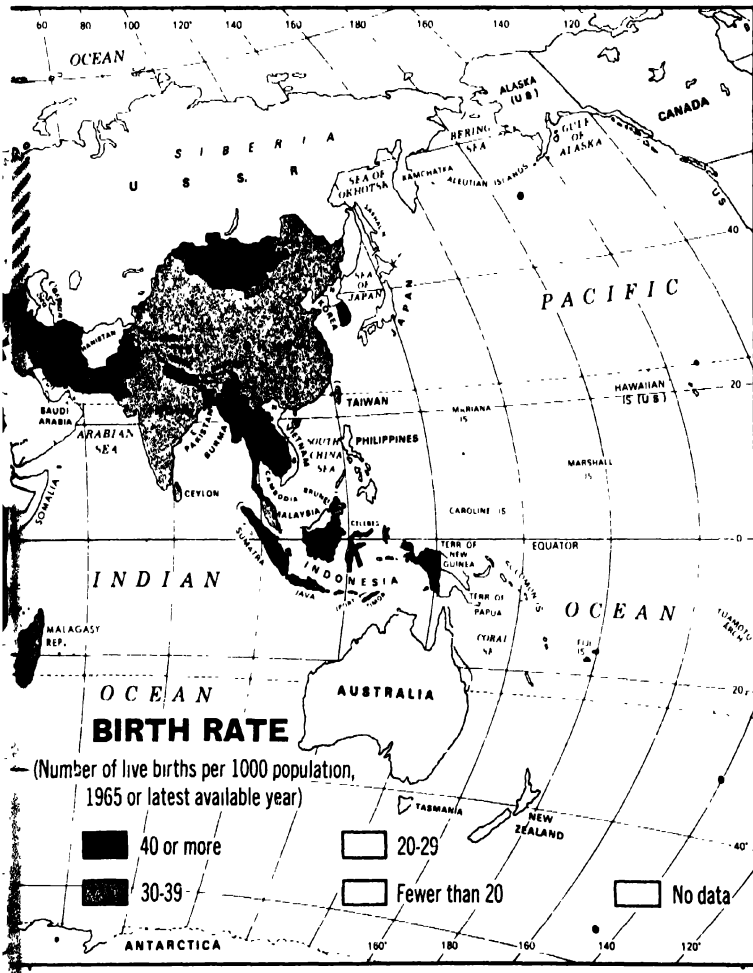

FRANCE. 18th-cent. France was a place of vast educational ferment as both philosophers and revolutionaries reconsidered the purpose and methods of education. The most influential of the philosophers was Jean Jacques Rousseau, whose *Emile*, 1762, asserted that education should develop the "natural goodness" of the child, an idea that effectively countered many of the then-powerful Christian beliefs which stressed the depravity of the child and the constant need for discipline. Another influential En-

lightenment thinker was Louis René de la Chalotais (1701–85), whose essay *On National Education* was an influential argument for a unified and state-controlled system of education. Though the activists of the French Revolution attempted to create such a system, the Reign of Terror stifled any lasting educational reforms. Thus it remained for the Napoleonic reforms of 1808 to set the foundations of France's modern educational system. These reforms (1) founded the Université de France, a purely administrative organ; (2) reorganized the structure of secondary and higher education into a unified state-controlled system; (3) instituted a state-controlled system of certificates (e.g., *baccalauréat*, *licence*) which could attest to educational quali-

fications; and (4) created a government system of teacher placement and school inspection.

Although François Guizot (1787–1874) attempted, in the Law of 1833, to extend state control to the primary-school level, his efforts were eventually thwarted by the Loi Falloux, 1850, passed during the 2nd Republic. However, Prussian military successes in 1866 and 1870 (the so-called "victories of the Prussian schoolmaster"), jolted many Republican reformers, most notably Jules Ferry (1832–96), into working for the creation of a universal system of state-controlled public education. Thus, there quickly followed the Laws of (1) June 1878, which required each commune to own its own primary school; (2) June 1881, which abolished all fees

for primary schools and training colleges, and (3) Mar. 1882, which made education compulsory for all children between the ages of 6 and 13. Church influence in the public schools was greatly restricted by the Law of 30 Oct., 1886 (which forbade clerics to teach in the schools and banned all religious instruction in the primary schools), and by the Associations Law of 1901 (under which the anticlerical Prime Minister Émile Combes closed some 300 parochial schools, 1902-5, and forbade, 1904, all teaching congregations).

BRITAIN. Hampered by a severe church-state controversy, Britain was the last of the major European powers to develop a system of public education. The need for establishing one, however, was seen early in the 19th cent. by the Anglican parliamentarian Andrew Bell (1753-1832), the Quaker schoolmaster Joseph Lancaster (1778-1838)—both of whom claimed to have originated the monitorial, or Lancastrian, system—and the Whig reformer (Lord) Henry Brougham (1778-1868). In 1832 the reforming Whig government set aside some £20,000 to aid school construction, the 1st parliamentary education grant; and in 1839, an inspection body, the Committee of Council on Education (the forerunner of the Ministry of Education), was established.

Despite governmental concern and increases in grants (£813,400 by 1861), it was not until after the extension of the suffrage in 1867 that Parliament turned its attention to major educational reform. A product of religious compromise, the Education Act of 1870 (Forster Act) provided that (1) V.A. ("Voluntary Agency," i.e., parochial) schools remain under private management; (2) new secular and rate-aided schools be built in order, in the words of W. E. Forster, to "complete the voluntary system and fill the gaps"; (3) local school boards be created; and (4) nondenominational religious instruction be given in all secular schools (the controversial "Cowper-Temple Clause"). This act, coupled with those of 1880 (compulsory education) and 1891 (abolition of fees), caused a

great increase in school attendance (from 1,168,000 in 1870 to 4,000,000 in 1881).

Dissatisfaction with the Cowper-Temple Clause and with the inefficiency of a plethora of local boards (over 2,500 by 1900) resulted in the Board of Education Act, 1899, which instituted a unified central control, and the Balfour Act, 1902, which (1) set up a smaller number of Local Educational Authorities (L.E.A.'s) in place of the school boards; (2) brought all schools, including V.A. schools, under varying degrees of control by the L.E.A.'s; (3) abolished the religious requirements of the Cowper-Temple Clause; and (4) recognized, for the first time, that secondary education was a responsibility of the state. The full meaning of this last provision was underscored in the only partially successful Fisher Act of 1918, which required that all youths 14-18 years of age receive some form of education.

The development of higher education was also affected by religious controversy. Rather than charter a dissenters' university in London or an Anglican rival, King's College, the government chartered the University of London, 1836, as a nonaffiliated and nonteaching body responsible for examining and conferring degrees. At Oxford and Cambridge the Established Church remained in control until 1858, when dissenters were finally admitted, and not until 1871 were religious tests at the 2 institutions totally abolished. Further, to meet increasing demand, some 9 other university colleges besides London and the Anglican Durham University, 1837, were opened in England before 1900. Called "red brick," these nonaffiliated institutions (whose curriculums were designed originally to meet the demands of the special trades of their particular cities) eventually received their own charters (e.g., Birmingham, 1900; Liverpool, 1903; Leeds, 1904; Sheffield, 1905; and Bristol, 1909).

UNITED STATES. When the 13 colonies declared their independence, they already possessed a long and notable educational tradition. Some colonies (e.g., Massachusetts, 1647) had even experi-

mented with compulsory education laws, and by 1776 the new nation could boast of some 9 colleges (Harvard, 1636). The bulk of this educational activity, however, took place in the semi-theocracies of the northern colonies, where the church was closely identified with the state. Thus the beginnings of modern education in America date not so much from colonial times as from the years directly following the Declaration of Independence, when the church was progressively disassociated from the state, and hence from education. Also, although the Federal Land Grant Ordinances of 1785 and 1787 did contain provisions for education, the control of schools in the U.S. evolved as a function of state rather than federal government. The 1st important laws establishing the right of the state to create a system of "free schools" for all (laws passed over violent religious opposition) were in Massachusetts, 1827; Pennsylvania, 1834; New York, 1867; Connecticut, 1868; and the midwestern states, 1850's. The building of effective systems of public education, necessitated by the advent of Jacksonian democracy (1830's on), was accomplished by the so-called "common school" reformers, e.g., Horace Mann (1796-1859) in Massachusetts and Henry Barnard (1811-1900) in Connecticut. In 1852 Massachusetts became the 1st state to pass a compulsory-education law.

Secondary education, too, expanded in 19th-cent. America. In addition to the traditional Latin schools of colonial times, there arose a multitude of academies which stressed a more modern secondary-school curriculum. By 1850 there were some 5,000 of these schools. From 1860 on, however, the academics were supplanted by the public high school (the 1st established in Boston, 1821), especially after the Kalamazoo Decision of 1874, which held that local school boards did have the right to tax for the maintenance of public secondary schools.

The 19th-cent. witnessed a vast extension of higher education as well. As a result of public demand and religious controversy, hundreds of colleges (most of them denominational and many short-

lived) were founded by 1861. The number increased even more after the Morrill Land Grant Act of 1862, which set up public agricultural colleges. Private philanthropy of the Gilded Age resulted in further university growth, e.g., Vanderbilt, 1873, Johns Hopkins, 1876; and Stanford, 1895.

During the Progressive Era a reform movement in education was born. The philosopher John Dewey (1859-1952), who argued that learning must be related to life, was the chief exponent of progressive education. The resultant curriculum reform, begun by the Committee of 10, 1890, culminated in 1918 with the publication of the influential *Seven Cardinal Principles of Secondary Education* (which emphasized civic education) and the passage of the Smith-Hughes Act (which stressed vocational education in the high school).

OTHER WESTERN COUNTRIES.

Not all of Europe experienced educational success. In Italy, for example, the Casati Law of 1859, passed originally for Sardinia but later adopted for all of Italy as the basis for that nation's compulsory-education laws, was not very effective; in 1922-23, illiteracy rates ranged from 11% in the north to 70% in the south. The Casati Law also attempted to organize Italy's secondary schools, but they remained in a fairly chaotic state until the Gentile reform of 1923. The most famous of Italy's educational reformers was Maria Montessori (1870-1952), whose pedagogical beliefs roughly paralleled those of John Dewey.

Elsewhere, the European emigrants of the 17th-19th cents. took their educational heritage with them. The 1st schools in Australia (New South Wales, 1803) were Anglican-controlled, and it was not until the Act of 1866 that a free, secular, and virtually compulsory school system was established. Canada was plagued by violent religious controversy. The Quebec Act of 1774 allowed the French Catholic educational system (which began in 1685) to continue, but made no provision to support it. The British North America Act, 1867, placed the control of

education in the hands of the provincial governments, but stipulated that they could not interfere with the internal management of parochial schools. Universal free schooling was available in the eastern provinces in 1870, and in the western provinces by 1910.

In Latin America, the educational reform movements prompted by the independence struggles of the early 19th cent. were marked by efforts to remove the church from the classroom and to set up national systems of education. National universities created at this time include Argentina's Buenos Aires, 1821; Colombia's Antioquia, 1822; Peru's Trujillo, 1824; Bolivia's La Paz, 1831; and Chile's Santiago (founded in 1738 but nationalized in 1843). In their efforts to found national systems of education, the reformers of Latin America looked to Europe and America: Argentina's Bernardino Rivadavia and Domingo Faustino Sarmiento, for example, drew their inspiration from England's Lancaster and the U.S.'s Mann, respectively. Argentina, however, was the only South American nation which met with any significant success in eradicating illiteracy.

SPREAD OF WESTERN EDUCATION TO THE NONWESTERN WORLD, c. 1800-1950

The spread of western education to nonwestern peoples came as a result of (1) a direct imposition of European institutions by means of colonization, and/or (2) an expedient adoption of modern education by a country seeking to defend itself against western military or economic encroachment. As was true for Europeans a century or so before, nonwesterners found western education to be a potent force for modernization.

JAPAN. The seeds of Japan's modern system of education were sown at the beginning of the Tokugawa period when the Shogun Ieyasu issued the Buke Shohatto, 1615, which ordered the samurai to devote themselves to learning as well as to warfare. Soon schools of Con-

fucian learning (imported from China) sprouted throughout the land. Into this state system of education the militaristic shogunate of the 18th cent. infused western knowledge. Convinced that his officers should know something of western military sciences, the Shogun Yoshimune ordered, 1740, 2 of his courtiers to study Dutch and then translate works in that language. To further the cause of translating yet more western writings, the shogunate established, 1811, the Bansho Wago Goyo (Office for Translating Barbarian [i.e., Western] Writings), an institution replaced, 1856, by the more important Bansho Toishirabe-dokoro (Institution for the Investigation of Barbarian Languages). Also, 1856, the shogunate opened the Kobusho, a school of western military science, and 3 years later a western-style naval academy was established. Foreign education penetrated to the local level as well. By 1868, among the 300 or so schools run by the feudal lords, there were some 45 teaching Chinese medicine, 12, western medicine, 29, western studies; 3, Dutch studies, and 6, English studies.

The Meiji Restoration of 1868 signaled an acceleration of Japan's educational growth. In 1868, Keio University was founded; in 1877, out of the shogunate's school for western learning, there sprang the Tokyo Imperial University, the pinnacle of Japan's education system; and, in 1882, Waseda University was founded, the 1st of Japan's private universities. Primary education also received emphasis. The Education Law of 1872 stipulated that all people, regardless of sex or social position, should receive a basic education. Popular education was greatly advanced when Japan's 1st "modern" prime minister, Ito Hirobumi, took office in Dec. 1885. Ito promptly appointed the greatest of Japan's ministers of education, Mori Arinori. Mori, who had traveled extensively in and was impressed by Europe, adopted a German organizational and pedagogical pattern for Japan. The Sino-Japanese War, 1894-95, demonstrated to Japan's leaders the strategic value of heavy industry; and to

further its development, a Vocational Education Law was passed in 1894. The Meiji emperor was concerned, however, lest this modernizing of education lead to a westernizing of Japan. In 1890, therefore, an Imperial Rescript commanded that Confucian and Shinto values be made the basis for all education. Except for expansion, the Japanese system of education remained in this form until the American occupation.

CHINA. Traditional Chinese education (formalistic and identified with the political service) remained unchanged from the 11th to the mid-19th cent. The 1st western school (a Catholic seminary) was opened in 1852, and shortly afterward a variety of other missionaries opened western-style schools. In 1861, as a result of increasing commercial involvement, the government established 2 colleges (Canton and Peking) for the study of western languages, and from the mid-1880's it started sending students to America and Europe to study. Not until after the Boxer Rebellion, 1899-1900, however, were there any massive governmental reforms, the most important being the establishment of the National University at Peking, 1902, and the modernizing of the civil-service examination requirements, 1905.

Popular education was a great concern of the Nationalists, who, from 1912 on, established a system of education which closely resembled the American pattern. Indeed, the ideas of the American educator John Dewey enjoyed a considerable vogue in the Nationalist period. The greatest problem facing the exponents of popular education was the simplification of the traditional, and very complicated, system of writing. This problem was partially solved by the introduction of the *pu-hua* ("plain talk") system invented by the philosopher Hu Shih. Using such simplified Chinese, James Yang-ch'u Yen organized a massive government literacy campaign in the 1920's and 1930's. (By 1937, 42% of primary-school age children were in school.) The number of universities also increased: 47 in 1925, and 108 in

1937. During the 1930's the Nationalists tried to bring all schools (including missionary institutions) under a unified central control. World War II laid waste many schools and universities, but this was only a temporary setback; by 1946, some 60 universities, with some 60,000 students, were in operation. After 1949 the Nationalists in Taiwan established a system of education on the Japanese model, while the Communists on the mainland nationalized all schools.

INDIA. Western education was introduced into India in the 18th cent., when Protestant missionaries (e.g., Danish, from 1705, English Baptists, from 1793) 1st arrived. But not until the rise of British ascendancy over the subcontinent at the beginning of the 19th cent. was education officially sponsored. In 1813, prompted by Utilitarian motives, Parliament directed the English East India Co. to set aside a sum each year for the education of Indians; some 10 years later, the Company set up 2 Committees of Public Instruction (at Madras and in Bengal) to supervise this educational effort. The cause of western education in India received its greatest impetus, however, with the publication of Thomas B. Macaulay's *Minute on Education*, 1835. Eloquenty arguing the case for Anglicizing the people of India, Macaulay was instrumental in spreading a system of education in which English was the medium of instruction and literary studies were emphasized. The resulting educational policy was not without its defects: (1) it was not at all conducive to the growth of primary education (in 1905, only 1 village in 5 could boast of a school); (2) it caused a disproportionate growth of secondary schools and universities (1st university colleges: Calcutta, Bombay, and Madras, 1857; Punjab, 1882; Allahabad, 1887); (3) instead of science, it emphasized a literary curriculum which trained students only for a diminishing number of civil-service positions; and (4) it created a special breed of men, at ease neither in eastern nor in western society.

Though the British sponsored numer-

ous commissions of inquiry into the problems of education, it was not until the 20th cent. that anything positive was accomplished in the way of reform. Both the Indian National Congress and the All-India Moslem League were outspoken in their demands for universal primary education and an emphasis on Indian, rather than European, studies. The pace-setting All-India National Education Conference convened by Gandhi at Wardha, 1933, called for the creation of special junior- and senior-level secondary schools in which vocational and technical instruction, and not simply university preparation, would be stressed (a scheme reinforced by the influential Sargent Report of 1944). The Wardha Scheme and the Sargent Report remain the basis of India's present educational system.

MIDDLE EAST. Western education came to the Middle East as a result of both a direct imposition of European control and a conscious adoption by indigenous governments seeking to improve themselves militarily. The latter case is well illustrated by Turkey. During the reign of Selim III (ruled 1789–1807) western education was introduced through military schools staffed with European teachers. During the time of Mahmud II (ruled 1808–39), Turkish students went to study in the capitals of Western Europe for the 1st time, and a Council of Public Instruction was founded, 1838, to lay the basis of a system of public education. In the reign of Abdul Mejid (ruled 1839–61), a reign dominated by the westernized reformer Mustafa Reshid, a modernization plan, the *Gulhanehatti-kumayouni* (which called for education expansion) was drawn up and partially implemented. As a result of the revolt of the "Young Turks," July 1908, the reign of Mohammed V (ruled 1909–18) was marked by a reorganization of military academies and a policy of secularization in government-supported schools. Secularization occurred even more under the republican regime of Mustafa Kemal Atatürk, 1923–38, when even the *medresses* (Islamic colleges) were brought under the Commissariat of Education. Not

until 1948 did the Turkish Assembly soften this hard policy of strict separation between mosque and state.

As had been the case in Turkey, so in Egypt the modernization of the educational system was begun locally, though later it received an impetus from direct European intervention. Following the French occupation, 1793–1801, and the British invasion, 1807, Mohammed Ali (ruled 1805–48) was determined to modernize the Egyptian army. By 1820 he had imported a variety of French instructors (notably Col. Joseph Sèves) and opened a military school at Isna. In addition, Ali sent several officers to Europe (principally France) for study. During the reign of Ismail Pasha (ruled 1863–79), who himself had studied in Europe, government schools patterned after the French *lycées* were established. During the period of direct British control of Egypt, 1882–1919, education did undergo some reform: (1) many foreign schools (chiefly missionary enterprises) were opened; (2) the curriculum of higher educational institutions became Anglo- rather than Francocentric, (3) the ancient Islamic university al-Azhar (founded A.D. 970) was modernized by the Mufti Mohammed Abduh, 1899; and (4) Cairo University was opened at Giza, 1908. There were problems, however. As in India, there were too many unemployed westernized intellectuals, and British efforts to spread primary education were feeble and half-hearted.

In much of the remaining Middle East, French influence predominated (e.g., at the University of St. Joseph, founded at Beirut by French Jesuits, 1881, and the Académie Libanaise, Beirut, 1937). The one major exception to this generally French pattern was the American University at Beirut, founded by missionaries in 1866.

SUB-SAHARAN AFRICA. The 1st main thrust of western education was carried to Africa by missionary societies founded as a result of or in reaction to Pietism in Germany and Wesleyanism in Britain, e.g., the Church Missionary Society (C.M.S.) founded by Anglicans

in 1799 and operational in West and East Africa; the Swiss Basel Society, active in the Gold Coast from 1828; and the French Society of Our Lady of Africa ("White Fathers"), founded in 1868 and operational in East and Central Africa. Although influential despite their small numbers, the missionaries' educational effectiveness was confined to a very few areas, e.g., Freetown, Sierra Leone, where in 1816 the C.M.S. opened tropical Africa's 1st secondary school, Fourah Bay College, which, in 1876, offered tropical Africa's 1st university courses. The missionaries sought primarily to increase mass literacy so that the Bible could be read, but they did dispense some advanced literary education to a few of their brighter students. By the 1820's Freetown was sending students to Britain to study the classics, and by 1848 some citizens of Dakar were fully assimilated into French culture.

With the onset of imperialism at the end of the 19th cent., education fell into the hands of colonial governments. But because of the problems connected with establishing colonial rule and the demands of World War I, the organization of education remained in a confused state until the 1920's, when Britain, France, and Belgium each issued a policy statement which set the pattern for the modern development of education in tropical Africa. The British statement, prepared by the Advisory Committee on Native Education, 1925, and prompted by the American Phelps-Stokes Commission to Africa of 1921-22, called for (1) primary education in the vernacular, (2) a stress on vocational (especially agricultural) education, and (3) the planning of a comprehensive system of education that was to culminate eventually in university training and at the same time prevent the creation of an unemployed educated elite. The French policy statement, written by R. Antonetti in 1925, largely echoed the British statement except that French, and not the vernacular, was to be the medium of instruction in the primary schools. The Belgian government's statement of 1925 differed con-

siderably, however. Emphasis was placed only on primary education, which, after the Concordat of 1906, was left largely in the hands of the Catholic Church.

The next set of major reforms came during and after World War II. During 1943-45, Britain's Asquith Commission (for West Africa) and Elliot Commission (for East Africa) planned the development of university expansion (Achimota, Gold Coast, 1948; Ibadan, Nigeria, 1948; Makerere, Uganda, 1949; University College, Khartoum, Sudan, 1951), and a British White Paper, *Education for Citizenship*, 1948, called for primary-school expansion. France's educational reforms were initially outlined at the Brazzaville Conference of 1944, at which de Gaulle promised a vast expansion of primary education. In response to African demands, however, technical and secondary education received the main emphasis in the Colonial Development Plan of 1946. Two years later, the University Institute of Dakar was established. Also in 1948, Belgium issued a 10-year development plan which made provisions for academic secondary schools. In 1954, Lovanium was established as the 1st Congolese university.

THE WORLD EDUCATIONAL COMMUNITY, 1945-1968

The 3rd phase in the development of modern education has been in effective operation only during the past quarter-century or so. In this stage, education became less western and more universal in its appeal and application, its problems and potentialities.

A SIMILARITY OF PROGRAMS. As a relatively homogeneous form of modern education settled over the world, the educational policies of the nations exhibited distinct similarities. For one thing, scientific and technical education received a universal stress. In the U.S. this stress could be seen in the increasing involvement of the federal government in education, e.g., in the large number of grants to universities for scientific re-

search both during and after World War II, and in the National Defense Education Act of 1958 (a product of the "Sputnik Crisis"). In the USSR, as a result of the efforts of Professor A. I. Markushovich, among others, mathematics and science instruction received great emphasis after 1950. In 1953, the Moscow School No. 425 was opened as a specialized scientific school for talented youths (by 1969 there were about 100 schools operating on the No. 425 plan), and soon afterward 4 special boarding schools (Moscow, Leningrad, Kiev, and Novosibirsk) were opened for extremely gifted young scientists. Chinese education also stressed scientific study. Both the speech of Vice-Premier Chen Yi, June 1961, and the *70 Articles Concerning Education*, Fall 1961, called for Chinese schools to produce an increasing number of technical experts and not simply revolutionaries. (This policy, implemented during 1961-66, later came under fire during the Cultural Revolution.) In Britain, technical education at a lower level was sponsored by the Education Act of 1911, and at a higher level by the expansion of the Imperial College of Science and Technology, beginning 1953, and the growth, beginning 1957, of some 14 Colleges of Advanced Technology (C.A.T.'s).

Another similarity in programs can be seen in the efforts of virtually all nations to extend educational opportunities to as many citizens as possible. In the U.S. a considerable expansion took place at the post-high-school level: the number of colleges increased from 9 in 1776 to nearly 700 in 1967, while the number of 2-year "junior colleges" (1st one: Joliet, Illinois, 1902) grew from 74 in 1915 to over 700 in 1967. Britain's Education Act of 1944 promised "secondary education for all" and the British evolved a system of "modern" schools roughly comparable to American general high schools. In the USSR, Khrushchev's educational reforms of 1958-59 planned for (1) an extension of the period of compulsory lower-school attendance from 7 to 8 years, (2) the addition of an extra year to the higher-school curriculum, and (3) a 3-year non-compulsory continuing education scheme

for students not in a higher school. Developing nations have felt keenly the need to extend a basic education to all their citizens. The Indian Constitution of 1949, for example, laid down the principle (not yet converted into the fact) of compulsory education until the age of 14, and the 1961 Conference of African States on the Development of Education placed a high priority on achieving 100% primary-school enrollment by 1980.

A SIMILARITY OF PROBLEMS. Increasingly, nations have discovered that their educational problems are not unique. The relationship of church, state, and education is an example. In the U.S., although both federal and state constitutions stress the necessity of a separation of church and state (the New York Board of Regents barred all forms of prayer from the classroom, June 1962), the hard line of no aid at all to parochial schools has softened somewhat. The Oregon Decision, 1925, recognized the right of churches to maintain separate school systems, and the Everson Decision, 1947, found that the parents of parochial-school children might legitimately be reimbursed for some educational expenses such as school-bus transportation. The Elementary and Secondary Education Act of 1965 provided some federal financial assistance to church schools. In France, too, as a result of de Gaulle's controversial Law of 31 Dec., 1959, some government aid to the parents of children attending religiously sponsored schools was allowed. In Britain the existence of Voluntary Agency schools was much strengthened by the Butler Act of 1944, which institutionalized a dual system of state and church schools. Even such nonwestern areas as tropical Africa have been troubled by the problem of church schools. Though many nationalists (especially Sekou Touré of Guinea, whose government took over the church schools) have attacked mission schools as agents of neocolonialism, most newly independent African countries have chosen not to nationalize their church schools, so great is the cost of any alternative.

Another major area of controversy is the perennial conflict between educa-

tional quantity and quality a conflict which in the USSR and the People's Republic of China has taken on the added flavor of an ideological conflict. In an ideal Communist state all students are treated as intellectually equal, and none should be permitted educational advantages denied to others. But, in practice, many planners in the USSR and China have realized the importance of creating an intellectual aristocracy. Thus scholars of the Soviet Academy attacked Khrushchev's reforms of 1958-59, the effect of which was to water down the scientific curriculum in order to reach more students, and also to place a higher value on practical experience than on academic qualifications in university placement. Similarly, scholars of the Chinese Academy came under attack, June 1966, from the forces of the Cultural Revolution.

RISE OF INTERNATIONAL CO-OPERATION. Despite international education conferences at London, 1851, Philadelphia, 1876, and Brussels, 1880, it was not until 1909 that the Belgian, Edward Peeters, set up at Ostend the 1st permanent International Bureau of Education. World War I, however, suffocated this infant society and not until Dec 1925 was a 2nd Bureau (still in existence) established at Geneva. In addition, under the auspices of the League of Nations a Committee on Intellectual Cooperation was established, 1922. The events of 1936 onward diminished the effectiveness of this committee, but a Conference of Allied Ministers of Education held in London, Apr. 1944, agreed to re-establish an international education body at the war's completion: the United Nations Economic, Scientific, and Cultural Organization (UNESCO), which was established at Paris in 1946.

International educational co-operation, however, has not been limited to multi-lateral organizations, many individual governments have furthered its cause. For example, Britain's Colonial Development and Welfare Acts of 1940 and 1945 devoted some £7,350,000 toward the construction of universities and technical institutes, France's Plan for Modernization and Equipment, 1946, called for an overall development of education in her overseas possessions; and the U.S.'s Fulbright Act, 1946, and "Point 4" program, 1949, called for an international exchange of students and teachers, and recognized the responsibility of industrial nations to give educational aid to developing areas.

Recent events in the field of international educational co-operation have taken on a variety of new forms. The Soviet American Cultural Agreement, 1958, provided for educational exchanges between the world's 2 most industrialized countries. Former colonial powers continued to aid their former colonies, but in a different way: e.g., France co-ordinated its educational assistance within the French Community, 1958, while Britain channeled assistance through a newly formed, 1961, Ministry of Overseas Development. Many nations that were not themselves great colonial powers began sending educational aid to the developing world. For example, Canadians are presently teaching in West and East Africa; Chinese and Soviet teachers are now, or have been recently, instructing in Guinea, Ghana, and Tanzania, and the U.S., through the Agency for International Development, 1961, the Peace Corps, 1961, and the International Education Act, 1966, has extended educational assistance into virtually every corner of the "3rd World."

THE REVOLUTION IN SCIENCE

The Philosophical Outlook of Post-Newtonian Science

CARTESIAN DUALISM. From Descartes (1596-1650) to Kant (1724-1804), science and philosophy groped hand in hand for a viable exit from the labyrinth of the mind-body problem set up by Descartes. Cartesian dualism, fully developed in the *Principia philosophiae*, 1644, was a congenial inspiration for scientific methodology, though a metaphysical monster. To treat the physical world as body alone was, for Descartes, to reduce phenomena to extension and motion. This, in turn, should permit a complete mathematization of physics. However, Cartesian mathematics and Cartesian physics were never wedded in the philosophical restatement of Galileo's practical program for physics. Galileo described specific terrestrial motions in detailed mathematical language in his *Discorsi*, 1638. Descartes outlined a universal dynamics, which by its very nature could not be set out satisfactorily in quantitative terms; even the 2nd book of Newton's *Principia* showed the impossibility of developing successfully a fluid mechanics capable of justifying the Cartesian vortices in mathematical terms. Nonetheless, it was the authority of Descartes more than any other single writer which set the tone and temper for science of the Newtonian era.

Concentrating on body apart from mind was to center on matter alone (in terms of motion and extension). Only the rational soul of man qualified as an inhabitant of the realm of mind. All other activities of living beings could be ex-

plained through material actions. The details of these material actions were to be perceived by rules laid down in the *Discours sur la méthode*, 1636, modeled on the methods of Greek geometry and theoretically available to anyone. The method aimed at eliciting clear and distinct ideas about things. Clearness and distinctness led to an assurance of reality; they also led to a determination of true qualities. The only qualities sufficiently clear and distinct were the mathematical ones, extension and motion. This reductive materialism can be found in Galileo's *Saggiatore*, 1623, and in extreme form in Hobbes's *De corpore*, 1655. The complete separation of mind from body led not only to materialism in physics but also to mechanism, since dynamics (physical causality) was of primary concern to Descartes. Purposely eschewing all spiritual and occult forces, he laid out a physics designed to yield clear and distinct cognition of simple causative processes, viz., mechanical, "billiard-ball" situations.

MECHANISM. Mechanism, the primary legacy of Descartes to his scientific contemporaries, spurred both practical and theoretical researches in physics. Since material contact of bodies was the *sine qua non* of a mechanistic model, the problem of impact was the leading question of the day for physicists. Despite their disavowal of Aristotelian-scholastic thought, Cartesians were forced to introduce subtle (ethereal) matter in the place of supposed vacuums. The alternative was empty space through which physical

forces were still propagated—such mysterious occurrences could not be allowed! The work of Boyle in pneumatics registered aversion to the existence of an absolute vacuum. In the investigations of Christiaan Huyghens (1629–95) on the nature of light and of gravity, the apex of mechanistic physics was reached. He followed Descartes in analyzing light in terms of impulse transmitted through subtle matter. He surpassed Descartes in developing a theory of “gravific” subtle matter in a spherical vortex; the weight of a body corresponded to the centrifugal tendency of its component subtle matter. In the preface to the 2nd edition, 1713, of Newton’s *Principia*, Roger Cotes placed the Cartesian mechanists between the scholastics and Newton in scientific method with the following words: “These [Cartesians] supposed all matter homogeneous, and that the variety of forms which is seen in bodies arises from some very plain and simple affection of the component particles; and by going on from simple things to those which are more compounded, they certainly proved right, if they attribute no other properties to those primary affections of the particles than nature has done. But when they take a liberty of imagining at pleasure unknown figures and magnitudes, and uncertain situations and motions of the parts; and, moreover, of supposing occult fluids, freely pervading the pores of bodies, endued with an all-performing subtilty, and agitated with occult motions, they now run out into dreams and chimeras, and neglect the true constitution of things. . . .” Here Newton parted with the mechanists though he sympathized with their enterprise. For him mechanism was an hypothesis, not a program in physics. Even so, he showed hopes in the General Scholium to the *Principia* that eventually a fully mechanical model of the world might be conceived on the basis of experimental physics.

ABSOLUTISM. Newton was not without metaphysical assumptions. In his absolutist notions of space and time he showed the effects of mechanistic materialism. With matter and motion related mathematically, science moved teleologi-

cal explanation and the use of secondary qualities to a different level of discussion. This naturally led to preoccupation with space and time. Since Descartes, science had been presented with the idea of space as something primary. The Platonist Henry More (1614–87) made it clear that extension need not be equated with matter, and that extension, or space, is real even though uninhabited by matter. Space, in fact, became divine (not deity) in More’s view, and possessed the qualities of unity, simplicity, eternity, perfection, incorruptibility, and pure actuality. Like the Jewish mystics, More identified space with God’s omnipresence. His influence on Isaac Barrow (1630–77) showed in the latter’s geometrical Platonism, and more especially in a common notion of space. Barrow, Newton’s mentor, saw space as the presence and potency of God. As a mathematician and physicist he went on to deal with time as well as space, both entities being necessary to motion. “Time,” asserted Barrow, “does not denote an actual existence, but simply a capacity or possibility of permanent existence . . . whether things run or stand still, whether we sleep or wake, time flows in its even tenour.” Motion served only as a measuring stick for time. In space and time as divine absolutes, Barrow saw the source of mathematics’ certitude and lucidity.*

Ignoring the religious overtones of his teacher, Isaac Newton (1642–1727) retained the absolutist views of space and time, even attempting to demonstrate the difference between absolute and relative acceleration in his famous bucket experiment. Observing that water spinning in a bucket takes the same shape whether the bucket be moving or still, he concluded that the operative forces cause an accelerated motion relative to absolute space. Not until Ernst Mach (1838–1916) did anyone point out that the water accelerates with respect to the fixed stars, i.e., some other reference frame, not absolute space.

EXPERIMENTALISM. Before Newton, experimentation had usually been called upon for individual cases in evidence rather than for conclusive proof.

The growing interest in experimental approaches to physics was fostered primarily by Francis Bacon (1561–1626) and René Descartes. Bacon, impressed by the image of the craftsman creating tools to control nature, took this image as a key in his program for reforming society through science. Descartes, in less extensive manner than Bacon, set up the craftsman's experience as something close to his clear and distinct ideas necessary for scientific knowledge. In both cases, and generally among succeeding physicists, the experimental approach had meaning only in terms of a dehumanized nature. With the magical element absent from nature, control through rational, manual manipulation made sense. Mechanistic materialism was both symptom and partial cause of this trend. Only through this new philosophical outlook of the 17th cent. did the influence of the craftsman pervade scientific theory and lead to an emphasis on experimentation. Through the programs of scientific academies, e.g., the Accademia del Cimento in Italy, there occurred systematic experimenting on problems such as atmospheric pressure. A leading experimentalist prior to Newton was Robert Boyle (1627–91), but his work was not always systematic, nor was there in it the nice relationship of theory and data found in Newton's work. With Newton, especially in the *Opticks*, a new standard was set for the use of experimental evidence in scientific argument. Theory became dependent primarily upon systematic experiment. This novel view was so unusual that only the Frenchman Pardies among his many critics came to recognize Newton's "New Theory of Light and Colours" as a simple statement of observations. Much given to speculation in more informal contexts, Newton resisted indemonstrable hypotheses in his formal work on optics and mechanics. He saw action-at-a-distance as the result of ignorance of causes, not as a positive hypothesis about nature. The success of Newtonian physics, coupled with the new scientific philosophy, made systematic, experimental science the only respectable sort. The 18th cent. saw a large body of technical and

sophisticated experiments devised to particularize and extend Newton's theories; one example was Cavendish's determination of the value of the universal gravitation constant.

THEORIES OF KNOWLEDGE. The epistemology accompanying the new scientific philosophy incorporated the same elements, viz., dualism, materialism, and mechanism. Very few systematic philosophers espoused all these elements, but they formed the central problems in 17th- and 18th cent. theories of knowledge. Cartesian dualism sprang from Descartes' concern over confused ideas in the mind. Since these perturbations could not be from God, they must be from a non-mental source, the body. The bodily senses were capable of materialistic and mechanistic explanation. Only the human reason, receiving and recognizing clear and distinct ideas, was free of mechanism. These innate ideas were intuitive, rational truths, their reality hanging upon the reality of the ultimate idea, God. On clear and distinct ideas Descartes believed it possible to build certain knowledge. His followers overemphasized the deductive side of the system, and saw in it a geometrical, demonstrative sort of method. As such it inspired skepticism and mysticism in men like Pascal, who saw that metaphysics and empirical studies could never attain the certitude of Euclidean geometry. Spinoza (1632–77) carried the so-called Cartesian method to perfection in his *Ethica*, where a totally Euclidean system of demonstration appeared. In this line of thought Spinoza influenced many, from Leibniz in metaphysics to Putendorf in political theory.

Spinoza's epistemology solved the mind-body problem by dissolving it: he saw body and soul as 2 aspects of the same reality. The universe, both physical and mental, was described in terms of substance, attributes, and modes. Knowledge of the universe proceeded through 3 grades—opinion, reason, intuition. Observation of particulars gained significance only when such knowledge cohered in a system of truth. Harmony, rather than external correspondence, was the test

of truth. His monistic epistemology and ontology determined Spinoza's commitment to a strictly demonstrative methodology, leading from the unitary essence of God to all things.

John Locke (1632-1704) aimed his denial of innate ideas at Platonists like More as much as at the Cartesians. Stressing the empirical grounds of knowledge, Locke conceived the "blank tablet" (a phrase going back to Aquinas) of the mind as gaining knowledge through simple and complex ideas. Simple ideas derived from sensation and reflection, complex ideas from combinations of simple ones. His indecision on the degree of self-activity possessed by the mind during the relating of simple ideas allowed a variety of developments in his name by later philosophers. Also, despite his attempt to leave the existence of inner experience independent of outer, he made sensation so clearly the root of reflection that complete sensualism was the ultimate derivative of his system. It is notable that this 1st systematic attempt at empiricism in modern philosophy, 1690, appeared just 3 years after the 1st systematic attempt at empiricism in modern science—Newton's *Principia*.

George Berkeley (1685-1753), bishop of Cloyne, showed the direction which Locke's views, controlled by Cartesian dualism, were to take. If there is a strict division of mind and matter, Berkeley maintained, then all direct attempts at correlation of sensation and the external world are doomed. Complete certitude is present, according to Descartes, Locke, and Berkeley, only in intuitive knowledge. But Descartes and Locke saw the possibility of an intuition of substantial reality, Berkeley showed that only perception, not an object of perception, can be intuited. Like Hobbes, Berkeley disproved the conception of corporeal substance, yet through nominalism he ended up with no reality beyond perception. Only his development of a spiritualistic metaphysics led him to posit the reality of anything beyond perceptions.

While Berkeley disposed of the Cartesian realm of body in favor of mind, with finite spirits receiving ideas from the

infinite spirit, his successor David Hume (1711-76) carried empiricism to its logical end, viz., that neither spirit nor body can be shown to have any objective existence. Both Berkeley and Hume demolished the reality of abstract ideas: both recognized them as general names for groups of individual perceptions. A completely consistent nominalism led Hume to deny reality to mind as well as body; both were no more than complexes of perceptions. The only certain knowledge for Hume was pure mathematics, precisely because it concerns only the possible relations between contents of ideas. Hume's positivistic stand led also to a denial of any perception of cause and effect. The causal relation is no more than an imposition upon what is really sequence and nothing more.

The French temper was more receptive to this positivism than was the English. Étienne Bonnot de Condillac (1715-80) nicely represented the spirit of the French Enlightenment with his positivistic synthesis of sensualism and rationalism. Its sensualistic basis depended on a popular materialism. The detailed development of Condillac's views involved relations of ideas, science being only the result of various transformations of ideas. Simple composition and decomposition sufficed to explain all signs of ideas, thus all knowledge.

By the end of the 18th cent. the various issues raised by Descartes concerning knowledge of the external world had all seen development. Both empiricists and rationalists turned more and more to a recognition of the radical separation of the intellect from the outside world. That mental activity, rather than external reality, was the basis of knowledge emerged in such different philosophies as those of Leibniz and Hume.

OPTIMISM OF THE ENLIGHTENMENT. The optimism of the Enlightenment resulted from all the trends discussed above. The new scientific philosophy's most general impact was a guarantee of certitude. Whether through idealism or materialism, the scientific and philosophical outlook of the period suggested that now, as Pope said of Newton,

"all was light." Mechanism in science and determinism in philosophy were taken as favorable signs. In England, the Newtonian universe seemed to prove deism and rational religion in general. The geometrical metaphysics of Spinoza and the harmonic monadology of Leibniz had optimistic outlooks—one for knowledge, the other for ethics. German rationalism led, in the person of Alexander Baumgarten, to a science of aesthetics. Christian Wolff applied the geometrical method of Spinoza and Leibniz to pedagogy in general. Materialistic mechanism was carried to its physiological extreme of mechanistic biology by the physician Pancrätius Wolff in Germany along with Hartley and Priestley in England. Heinrich Lambert turned Locke's distinctions, in a more sharply conceived formulation, to good use in the measurement of intensity of illumination of light (*Photometria*, 1760).

The interest in sense perception and its systematization is apparent in the careful aesthetic distinctions of Lessing's *Laocoon* and the sensual bases given to mathematics by Rudiger and Lossius. La Mettrie's *L'Homme machine* expressed the popular currency in French thought

of a strictly materialistic and mechanical world in biology as well as physics. Voltaire increased the popularity of skeptical sensualism with his *Lettres sur les Anglais*, and literature saw the theory canonized in Diderot's *Rêve d'Alembert*. Condillac's brand of empiricism was recognized as the only philosophy by the government during the French Revolution; these views were called "ideology," i.e., the only worthwhile ideology in epistemology, by Destutt de Tracy. Sensualism and mechanism advanced to the extent that Laplace felt free to reply to the emperor that he had no need for the "hypothesis of deity."

Only toward the end of the 18th cent. did disillusionment with the great empirico-rational synthesis of the era appear. Leibniz' concern with feeling was accentuated by Herder in his essay on the soul. The failure of mechanistic biology appeared in the more rational objections of Kant as well as in the mystical tracts of Oken and Schelling. In France, Rousseau's *Émile* and *Nouvelle Héloïse* registered the failure of positivistic and mechanistic methods for the improvement of society.

The optimism of the 18th cent. was finally swallowed up by the French Revolution.

Astronomy and Cosmology

NEWTON. Newton's *Principia*, 1687, was based upon the establishment of the law of gravitation. The basic relevant problem, as put to Newton by Halley in 1684, was the shape of a planetary orbit wherein the centripetal force varied inversely as the square of the distance from the central body. Newton's proof that conic sections all describe paths involving such a force appeared formally in the 1st 4 sections of the *Principia*. His claim to have worked this out 2 decades earlier remains unproven by external evidence. The problem of mathematically resolving the attraction of a massive body into an attraction by a mass point at the center may have kept him from making his discovery known

earlier, this problem was solved by 1686. Positive scientific advances necessary to the law of gravitation, 1st based on the moon's motion, were Galileo's law of falling bodies, Kepler's laws of planetary motion, and Huyghens' law of pendulum motion. To these Newton added basic definitions (primarily mass) and axioms (his 3 laws of motion) plus a highly inventive mathematics. On the basis of fluxions (p. 907, below) Newton blended successive finite rectilinear figures into successions of infinitesimals forming smooth curved surfaces. The 3 books of his major work respectively deal with the motion of bodies *in vacuo*, the motion of bodies in resisting media, and the mathematical system of the world. The *Prin-*

cipia itself proceeds in the form of Euclidean geometry, while employing a mathematics foreign to Greek geometry. For both reasons the *Principia* could never serve as a textbook. Its form was too monumental and its mathematical reasoning was too intuitive. The subsequent development of calculus left the *Principia* standing as a lone pinnacle of human ingenuity and philosophic brilliance, but earthbound by a ponderous mathematics.

BRADLEY. The Newtonian synthesis gave rise to 2 centuries of observational and theoretical developments in astronomy and cosmology. Virtually all of these were elaborations or applications of Newtonian mechanics. James Bradley (1693-1762), 3rd Astronomer Royal, attempted for some time to give the 1 iron-clad proof of the heliocentric hypothesis—observation of parallactic displacement of the stars, resulting from the earth's motion in its orbit. When he found the star Gamma Draconis to change as much as 40 min. in position, 1725, he realized that this maximum parallactic displacement should have occurred at a different time of the year than the motion observed. But only in 1728 did astronomical aberration of light occur to him as an explanation. Involving the presumed motion of the earth in its orbit, the explanation depended upon the variations in speed and direction of the earth relative to the light coming from the star. Aberration suggested the heliocentric hypothesis almost as strongly as parallax, only a revolving earth would account satisfactorily for the phenomenon.

In the observations basic to his discovery of aberration, Bradley reported some minor variations not due to this cause. Between 1727 and 1747 he investigated the possibility that the influence of the moon's nodes (intersections of the lunar and earthly orbits) might cause the minute variations. After correlating changes in the moon's orbit with stellar displacement for the 19 years of a lunar nodal period, he showed that nutation accurately accounted for the data. Nutation, an irregularity in the motion of precession, is made up of many gravitational effects, but that identified by Bradley in

1748 is of primary importance. It gave observational evidence of Newtonian gravitational effects of other bodies upon the oblate spheroid of the earth.

KANT. Use of Newtonian mechanical principles was made in a speculative fashion in *Allgemeine Naturgeschichte und Theorie des Himmels*, 1755, published anonymously by Immanuel Kant. Thomas Wright's idea of a disklike form for the Milky Way provided Kant with a basis for hypothesizing an infinite system of such galaxies. Contractions in the rotating nebular disk were made the scientific explanation for the creation and motions of planets, satellites, and rings. This manifestation of 18th cent. rationalism made Newton's scientific reasons for theism less compelling.

CLAIRAUT. Comets, while generally explained by Newton, still posed problems in astronomy. Alexis Claude Clairaut (1713-65) began theoretical computations on the expected perturbations in the motion of Halley's comet, due to reappear sometime from 1757 on. After laborious computations he reported late in 1758 that Saturn and Jupiter had retarded the comet's motion 100 and 518 days respectively. His resultant prediction for the perihelion of the comet was just 32 days later than the actual occurrence, a margin of error he had explicitly anticipated. This prediction gave another support to the Newtonian gravitational theory on which it was constructed.

BODE. In 1772 Johann Elert Bode (1717-1826) put forth a strange law intended to give some mathematical (not physical) meaning to the positions of the planets. Drawing the law from a recent footnote by J. D. Titius, Bode gave a series of integers representing the locations of the known planetary orbits. Starting with Mercury as zero, the series assigned the consecutive integers to the known succeeding planets (almost) in the general formula $\text{Radius} = 0.4 + 0.3 (2^n)$. This worked well until $n = 5$, for which no planet existed. When Herschel later discovered Uranus, which fitted into position $n = 8$, a body for $n = 5$ was searched for, and the asteroids were discovered. Neptune was later discovered under the

impetus of Bode's law, but its 20% deviation combined with Pluto's 50% deviation showed that the "law" was ultimately numerology.

HERSCHEL. Apparently without stimulation from Bode's law, William Herschel (1738–1822), in examining a section of Gemini with his self-made, superior telescope, noted a body moving along the ecliptic at about 1 min. per day. Since it could be easily magnified and had no tail, his final conclusion was that a new planet had been found. After computing the whole orbit, he found it to be 19 times larger than the earth's orbit. His attempt to name it for King George was ultimately thwarted by foreign insistence on the name Uranus.

In 1784–85 Herschel published 2 papers *On the Construction of the Heavens*. His extensive experience with telescopes brought him to the conclusion that galaxies were simply groups of small stars. He assumed the stars to be equally luminous and essentially equidistant from each other; on this basis he computed the depth of the Milky Way by counting the stars in the field of his telescope. The result was a given magnitude of the galaxy in terms of a mean distance between stars. The dynamic aspects of the universe he drew up in terms of a clustering tendency in nebulae, with the Milky Way as one example of such nebulae. His speculations evolved over the next decades so that in 1811 he maintained that distant, small nebulae were not results of agglomeration but rather the primitive state of thin nebulous matter from which cosmic evolution took place. Herschel's German-bred rationalism, evident in these theoretical works, was not received sympathetically at the Royal Society or the major universities of England.

LAPLACE. Pierre Simon de Laplace (1749–1827) was comparable to Newton in depth and breadth of genius in physics. While owing much to the simultaneous attentions of Lagrange to the same problems, Laplace completed and generalized the theory of lunar and planetary inequalities. Beginning with the distinction of secular and periodic inequalities of motion, he finally realized, 1784, that the

perturbations in the orbits of Jupiter and Saturn were periodic, not cumulative, over a long time. Since the times of revolution of Jupiter and Saturn are not quite commensurable (in terms of small whole numbers), disturbances in their motions were found to be repetitive in cycles of about 900 years with a rather appreciable, 3rd-order inequality. In his paper on the long inequality of Jupiter and Saturn, Laplace set down 2 significant relations for planetary motion. With respect to eccentricity he declared: "If the mass of each planet be multiplied by the square root of the axis of its orbit and by the square of the eccentricity, then the sum of these products for all the planets is invariable save for periodical inequalities." For inclination he gave an exactly similar law. It is notable that these statements establish funds of eccentricity and of inclination, which the planets collectively can never overdraw; if one increases its eccentricity, another's decreases.

In line with his discovery of apparently complete periodicity of planetary inequalities, Laplace found, 1787, the so-called secular acceleration of the moon's mean motion to be cyclical as well. He showed that a slowly decreasing eccentricity of the earth's orbit results, via the sun's influence, in acceleration of the moon's average rate of motion. Both variables he proved to be periodic: earth's orbital eccentricity would ultimately begin to increase, and the moon's motion would show deceleration in response.

With the publication of *La mécanique céleste*, 1799–1825, Laplace systematized his various discoveries into a tour de force of scientific and philosophical optimism. The concept of periodic variations was central to his universe, as it thus became predictable, certain, and essentially unchanging. (However, it should be remembered that his mathematics involved neglect of certain small quantities.) To Laplace it seemed that Leibniz' image of a perfectionist clockmaker was more correct than Newton's version of a deity occasionally resetting and rewinding his timepiece.

GAUSS. Karl Friedrich Gauss (1777–1855) added to the mathematical regu-

larization of the solar system by publishing, 1809, a method for calculating the orbit of a planet from 3 complete observations. Each positional observation involves right ascension and declination. The 6 equations based on 3 pairs of such elements allowed quick calculation of bodies difficult to observe. When Ceres, the 1st of the asteroids, was discovered, 1801, it was lost after a few weeks. Gauss applied his method to predict its orbit, and the planetoid was rediscovered about a year later very near the predicted position.

LEVERRIER. Jean Joseph Leverrier (1811-77) represented both the zenith and the nadir of Newtonian mechanics. On the basis of utter faith in the classical system, he considered it necessary to posit, 1846, an unseen planet beyond Uranus to explain the latter's perturbations. Using Bode's law and computations based on the Uranian inequalities, Leverrier assigned a position within 1° of that 1st observed for Neptune later in the year. Unfortunately for the Newtonian system, Leverrier then turned to the observation of $38''$ advance in the perihelion of Mercury. His reasoning for the existence of Neptune to explain problems with Uranus was reapplied with disastrous results. The prediction of an intra-Mercurial planet, christened Vulcan, led to a great search and ultimate failure. The presumption of an ironclad Newtonian system was tacitly dropped by Asaph Hall (1829-1907), who suggested a slight departure from the Newtonian inverse square law to explain Mercury. It only remained for Einstein to suggest a more significant departure.

EINSTEIN. The paper of Albert Einstein (1879-1955) on "Die Grundlage der Allgemeinen Relativitätstheorie", 1916, predicted a perihelial advance of $43.03'' \pm 0.03''$. The amazing correlation between this theoretical statement and observational data served to establish the general theory of relativity's point that the correct form of laws of nature is independent of the motion assumed for the observer. For Mercury's perihelion the theory worked on a basis of the square of the ratio of the planet's velocity and the velocity of light; for other planets the

result would be so small as to indicate an imperceptible motion. In 1917 Einstein indicated the cosmological usefulness of general relativity theory. With gravity reduced to local curvatures, produced by matter, in space-time, the primary object of investigation became space itself via non Euclidean geometry. Since space has a positive curvature in terms of attracting matter, the universe must have a finite content. The model of the universe set out by Einstein, as well as Willem de Sitter's variation on Einstein's model, was static. However, the equations used in the model require a situation without equilibrium. Succeeding cosmologists have generally recognized an expanding universe.

HUBBLE. Edwin P. Hubble, (1889-1953) gave some sense of observational order to the concept of an expanding universe when he demonstrated, 1929, that receding nebulae observed by Slipher and Shapley were moving away from us with a regular, linear increase in velocity. The shift toward the red end of the spectrum in analyses of nebular light indicated tremendous outward velocities and millions of light-years in distance.

EDDINGTON. Arthur S. Eddington (1882-1944) 1st computed the forces involved in the massive bodies of radiant stars. For the sun he found a central temperature of 18 million degrees and a central pressure of 9 billion atmospheres. In *The Internal Constitution of the Stars*, 1925, he set out the mass-luminosity law, showing that stellar luminosity is entirely determined by mass and quite independent of the diameter of stars. Eddington had assumed that stellar matter behaved like a perfect gas. When he found no contradictions to this assumption, even in dense dwarf stars, it became evident that centrally located stellar atoms had lost outer electron shells through ionization and thus moved freely despite the extreme internal density of stars like the white dwarfs. Eddington's work on the interior construction of stars has been basic for subsequent cosmology.

MILNE. E. A. Milne (1896-1950) was responsible for an alternative view, developed from 1932 onward, of the cosmos

based upon special rather than general relativity theory. Deriving space measures from observable time measures, he constructed a system with every member surrounded by an infinity of others receding with linear increase in velocity. The outermost move with the speed of light and are inaccessible, since the measuring standard (light) puts them an infinite distance away. Nonequivalent particles gather around equivalents to form nebulae. Abandoning the tensor equations of general relativity, Milne made natural laws invariant in transformations between equivalent observers according to special relativity. Though attempting to obviate ambiguities in applications of the general theory, Milne could not easily encompass certain features of gravitation, and his theory has remained peripheral to the major trend in cosmology.

THE EXPANDING UNIVERSE. The problems with which Milne was grappling are the essential characteristics of the cosmic model of Jules Lemaître (b. 1894), proposed in 1927 and developed by himself and George Gamow (b. 1904) since then. Lemaître's expanding universe theory develops from the instability of a world in Einstein's general relativistic model. Galaxies diverge outward from a "primeval atom" because their matrix, space, is constantly expanding with a broadly homogeneous distribution of "matter" therein. The equation of matter with geometrical features of space-time, and the meaning of homogeneity in such a model, prodded Milne to attempt a reformulation of the assumptions of cosmology.

THE "STEADY-STATE" THEORY. The general relativity universe involved certain conclusions which divided theorists in the 1940's. According to orthodox theory, the expanding universe must have had a point of singularity—a point when the density of the universe was infinite. Largely in reaction to this theoretical requirement, the "steady-state" version of the expanding universe was proposed by Hermann Bondi and Thomas Gold in 1948; Fred Hoyle and William McCrea remodeled it in accord with relativity theory. Such a universe had no beginning

and in its expansion was constantly forming new galaxies from hydrogen created in the gaps resulting from expansion. The singularity was thereby obviated, allowing a time-independent mean density as well as other time-independent properties.

QUASARS. Difficulties arose for the steady-state theory in the 1960's with the newly discovered significance of cosmic radio sources. As early as 1931 the appearance of radio signals in space was noticed. After World War II the improved techniques of radar were applied to obtain positions for radio sources in order to direct optical telescopes to these sources. In this way the 1st visible radio source, the Crab Nebula, was discovered, 1949. In the 1950's a number of strong radio emissions were found to correspond to weak light sources and were christened quasi-stellar objects, or quasars. Working in 1962 with the spectrum of one of these objects (3C 273), Maarten Schmidt 1st noted the red shift in quasar spectra. Since then quasars have been observed with red shifts indicating recession speeds over 80% the velocity of light. According to steady-state theory, such objects must be at noncosmological (intragalactic) distances. But it has been found that 3C 273, at least, shows radio emission passing through the Virgo cluster of galaxies, about 40 million light years from earth. Only if the red shifting is of non-Doppler origin can quasar data fit into steady-state theory.

BLACK-BODY RADIATION. The detection of cosmic black-body radiation, 1965, has been a major blow against the steady-state concept and in favor of some form of "big-bang" theory. About 1950 Gamow spoke of a very dense, extremely hot, early stage of the universe, from which an outward explosion took place. The original thermonuclear explosion would explain the large amount of helium observed today relative to hydrogen. From such an early stage, time would allow the passage to a state of equilibrium between matter and radiation having a black-body spectrum. Such a spectrum would continue and the only change during expansion would be cooling of the radiation. Recent calculations and observations have

arrived at a temperature of 3° Kelvin for the current stage. According to steady-state theory there is no explanation for the apparent ubiquity of black-body characteristics of the spectra over a wide range of wave lengths. The theory would seem to demand new radiation with newly created matter, and this new radiation

would not be uniformly black-body. Further observation of cosmic black-body radiation, with respect to its uniformity and universality, and with respect to other cosmological characteristics, such as an isotropic universe, will have much to say about the fate of present cosmological theories.

Mathematics

BERNOULLI BROTHERS. When Newton (in the 1660's) and Leibniz (in the 1670's) evolved the calculus, numerous mathematical problems suggested themselves. The Bernoulli brothers, Jakob (1654-1705) and Johann (1667-1748), both found inspiration in the mathematics of Leibniz and corresponded with him. They worked out most of the material contained in modern elementary texts on differential and integral calculus. Superior to his brother in critical power, Jakob followed Leibniz' more cautious view of infinitesimals as only potentially existent. The infinitely small he saw as "a perpetual fluxion toward nothing." Viewing the differential as variable, Jakob associated the calculus more with the method of limits. Johann, the more imaginative, adhered to the more philosophical side of Leibniz on infinitesimals and considered them to be actual. Rather than work toward a limit concept, he considered increase by an infinitesimal to be no increase at all, thereby making omission of higher-order differentials the fundamental procedure. It was however, partly on the basis of Johann's unpublished treatise on differentiation, 1691-92, that L'Hospital wrote his *Analyse des infiniments petits*, 1696, the 1st published textbook on the subject. L'Hospital's text was highly influential in spreading the new techniques.

TAYLOR AND MACLAURIN. Brook Taylor (1685-1731) is remembered chiefly for his series for $f(x+h)$, published in 1715. His *Methodus incrementorum* interpreted ratios of fluxions in terms of finite differences of moments. Colin Mac-

laurin (1698-1746), in his *Treatise on Fluxions*, 1712, attempted to satisfy the complaints of Berkeley's *The Analyst*, 1734, against the new analysis. Maclaurin therefore abandoned the infinitesimal as well as Taylor's algebraic tendencies in analysis, instead he developed geometrical demonstrations of analysis, omitting all notation of fluxions until the end of his treatise. His notion of instantaneous velocity for a variable motion was in terms of "the space that would have been described if the motion had continued uniformly" from the reference point. Maclaurin did not conceive of any such notion as the limit of an average rate of change as the intervals approach zero. His elegant geometry was much admired, but it obscured the greater promise of an algebraic approach.

EULER. Leonhard Euler (1707-83), despite his naive notions of infinity and continuity, contributed extensively to the development of calculus by means of a new, formalistic approach. He freed the new analysis from geometrical limitations by making the subject into a formal theory of functions. Systematically he studied and classified the elementary functions plus their differentials and integrals. In the use of infinite series, Euler warned others to be careful with divergent series, yet made such statements as $1 - 1 + 1 - 1 + \dots = \frac{1}{2}$. His contributions to trigonometry, theory of numbers, analytical geometry, and other fields all bear the mark of his genius for formalization.

D'ALEMBERT. Jean-le-Rond d'Alembert (1717-83) refused to consider Newton's prime and ultimate ratios of

quantities literally, but rather as limits of quantities. Strictly speaking, he decided, the variable quantity only approaches its limit rather than ever coinciding. The differential was simply the limit of ratios of finite differences of 2 variables. D'Alembert likewise defined 2nd- and higher order differences in terminology similar to the concept of limiting ratios. His geometrical analogies, however, involved paradoxes which dissuaded many mathematicians from abandoning the older view of actual infinitesimals. In various dynamical applications of the differential, he introduced—along with Daniel Bernoulli—the use of partial differential equations.

LAGRANGE. Joseph Louis Lagrange (1736–1813) avoided the imprecise conceptualization of limit given by d'Alembert, turning to Euler's function concept. In so doing Lagrange focused attention on the derivative (*fonction dérivée*). The use of Taylor's series, with some care for considerations of convergence, was basic in Lagrange's work; he assumed that all functions allow such a series expansion. Noting that the coefficients of the powers of h in the series involve the ratios of differentials and fluxions, he saw definition of differentials and fluxions in terms of these coefficients as a way to avoid introducing limits or infinitesimals. The result was a useful, formalized calculus, based on algebraic method. In his *Mécanique analytique*, 1788, the full power of his calculus of variations (developed in 1760–61) appears, with its unification of the varied principles of statics and dynamics.

LAPLACE. In contrast to Lagrange, Laplace (p. 904, above) saw mathematics purely as a tool for solving physical problems. This is evident in his *Mécanique céleste*, which introduced the potential function in the form of a partial differential equation applicable to gravitation, electricity, and magnetism. His *Théorie analytique des probabilités* was based on the method of generating functions, which treated successive values of any function as the coefficients in the expansion of another function with reference to a different variable; the latter is the

generating function of the former. Laplace also showed that the most advantageous method, in terms of minimum mean probability of error, for reducing many equations of condition to the number of unknown quantities to be determined was the method of least squares. In general, Laplace synthesized and formalized all prior knowledge on probabilities in a highly original and creative way.

LEGENDRE. Adrien Marie Legendre (1752–1833) made his contributions in the shadows of Laplace and Lagrange. His work on elliptical functions, 1825–26, started with Euler and Lagrange and left the subject in a state unchanged for another 40 years. Beginning with an integral depending upon the square root of a polynomial of the 4th degree in x , Legendre showed that such integrals reduce to 3 canonical forms. In number theory, his other abiding fascination, he did important work, crowned by the theorem of quadratic reciprocity. His formulation, 1806, of the method of least squares was useful to Laplace in probability theory.

GAUSS. Karl Friedrich Gauss (1777–1855) represented a turning point in the history of mathematics. For men like Laplace and Lagrange, mathematics had the service of science as its highest goal. Gauss, while still influenced by this older view, maintained that mathematics was the "queen of the sciences." Especially in number theory was Gauss's genius radiant. His *Disquisitiones arithmeticae*, 1801, gave the 1st rigorous proof of the so-called fundamental theorem of algebra, i.e., that every algebraic equation with real coefficients has at least 1 root and therefore n roots. His 3rd proof of this involved complex integrals. With the theory of quadratic residues, Gauss 1st introduced into number theory complex numbers of the form $a + bi$. This was extended, 1831, into an arithmetic as well as an algebra of complex numbers. Gauss gave remarkable clarification to the notion of complex numbers by representing them by points in a plane. Though contributing important work in calculus of variations, geod-

esy, etc., Gauss made his most striking discoveries in the realm of arithmetic, his "queen of mathematics."

FOURIER. It was Joseph Fourier (1768-1830), an active participant in the French Revolution, who called attention to the need for rigor in pure mathematics. His *Théorie analytique de la chaleur*, 1822, based on investigations of the propagation of heat in solid bodies, is the source of modern methods for the integration of partial differential equations with fixed boundary values. Objections by Lagrange to the theory did not disturb Fourier, who trusted to his physical intuition for the proper results. For all functions, even the discontinuous and the wholly arbitrary, he used an infinite series of sines and cosines of multiple arcs, the proof he provided in the expansion of an "arbitrary" odd function by a sine series. Earlier Lagrange had constructed by interpolation a finite summation formula from which Fourier's result is obtainable by a jump to infinity. But it required Fourier's lack of pure mathematical conscience to make this transition to an integration formula. Henceforth it was painfully obvious that mathematicians needed clarification of their intuitions of "arbitrary" function, real number, and continuity.

CAUCHY, WEIERSTRASS, AND RIEMANN. Augustin Louis Cauchy (1789-1857) made complex function theory an independent field of mathematical research. He is responsible for the foundations of the calculus as found in modern textbooks. His extraordinary output included detailed studies of convergence in infinite series. He gave the 1st existence proof for the solution of a differential equation and of a system of such equations. His attention to rigor in the definitions of limit, derivative, differential, definite integral, and continuity established a satisfactory means for dealing with the ancient paradoxes of Zeno, as well as the elements of the classical theory of functions of a real variable. In theories of functions, Cauchy's lectures, 1821, at the École Polytechnique were truly epoch-making. The establishment of complex-function theory on a basis of the

power series was due to Karl Weierstrass (1815-97), who began the reduction of principles of analysis to simple arithmetical concepts. The importance of topology for complex function theory was established by G. F. Bernhard Riemann (1826-66).

ABEL AND JACOBI. To Niels Henrik Abel (1802-29) and Karl G. J. Jacobi (1804-51) belongs the systematic foundation of elliptical functions. In 1827 Abel stood the investigation of elliptical integrals on its head: he considered a as a function of x rather than following the "normal" procedure of seeing x as a function of a . Through this inversion of the integral, he discovered the double periodicity of the elliptical function. Jacobi's classic text, 1829, on elliptical functions made the theory available to the mathematical public. From the details of Abel's and Jacobi's work many new directions appeared in mathematics, e.g., complex multiplication, elliptical theta functions, and elliptical modular functions.

HAMILTON AND GRASSMANN. William Rowan Hamilton (1805-65) was the 1st to publish, 1844, a consistent algebra of rotations and vectors in space. The fundamental formula was $i^2 = j^2 = k^2 = ijk = -1$. The quaternions derived therefrom did not follow the commutative law of multiplication. In successively more sophisticated presentations, 1853 and 1866, Hamilton showed the key importance of quaternions in mathematical physics, but a strong conservative tendency discouraged use of his new tool in physics. The more philosophically based contemporary algebra of Hermann Grassmann (1809-77) was almost totally ignored by physicists except for J. Willard Gibbs (1839-1903). Yet Grassmann's algebra not only dropped the commutative law; it also dealt with space of n dimensions. It included Hamiltonian quaternions as a special case and expanded the results to n -dimensional space. It included the theories of determinants, matrices, and tensor algebra.

NON-EUCLIDIAN GEOMETRY. Janos Bolyai (1802-60), N. I. Lobachevsky (1793-1856), and Riemann all discovered non-Euclidean geometry. Bolyai

in 1833 and Lobachevsky in 1826–29 published their independent developments of hyperbolic geometry. In hyperbolic geometry there is more than 1 parallel to a reference line. In Riemann's "spherical" non-Euclidean system, 1854, one finds the additional result that 2 straight lines intersect twice. Thus space becomes unbounded yet finite. In conjunction with abstract algebra, non-Euclidean geometry gave to modern mathematics its reputation as the imaginative creation of mathematicians.

CANTOR. Georg Cantor's (1845–1918) contribution to number theory was through point-set theory. In his arithmetical analysis Cantor derived all rational numbers from natural numbers and then defined irrationals through infinite sequences of rationals. Thus he arithmetized the continuum of real numbers. A 1-to-1 correspondence of points on a straight-line segment and the continuum of real numbers was established. In turn, he proved that all points in a spatial continuum can be put in 1-to-1 correspondence with all points on a straight-line segment. Distinguishing cardinal from ordinal numbers, he showed a significant difference between the 2 in the realm of transfinite numbers. With the transfinite ordinals, one could count well-ordered sets. For cardinal numbers Cantor proved, 1874, the set of all algebraic numbers to be denumerable, and in 1878 he showed how to construct an infinite nondenumerable set of real numbers. Demonstrating the existence but not the identity of any of these transfinite numbers, Cantor was fully in line with the medieval tradition of Adam of Littlebridge and Albert of Saxony.

KLEIN. Felix Klein (1849–1925) represented, in his Erlangen Program, a strong tendency of mathematics toward unification in the later 19th cent. His key to the classification of different fields was the group concept. In his inaugural address at Erlangen, 1872, he declared every geometry to be the theory of invariants of a particular transformation group. His approach to geometries dealt with distinct figures in restricted groups of transformations leaving definitions and theorems in-

variant. Yet it was exactly the geometry where the group is unrestricted and corresponds to identity which suddenly sprang to prominence in 1916 with general relativity theory. This theory showed space to be more than a locus and to have a structure of its own consisting of a set of relations generally not defined in terms of a transformation group. However, for almost half a century, group theory provided the basis for a synthesis of geometry and algebra.

LIE. M. Sophus Lie (1842–99) shared with Klein the honor of unifying mathematics through group theory. While Klein dealt essentially with discontinuous groups, Lie dwelt on continuous groups, writing in 1893 that this "theory of invariants of all continuous groups embraces all theories of invariants hitherto noted." Under continuous-group theory he was able to subsume Newtonian mechanical principles, kinematics, and differential invariants.

POINCARÉ. Henri Poincaré (1854–1912) stands at the pinnacle of 19th-cent. mathematics. In the calculus of finite differences his focal position is paralleled only by Newton's. Poincaré's automorphic functions, 1881–84, uniformized any algebraic curve $f(x, y) = 0$. He profitably applied continuous group theory to linear algebra. His many individual contributions, however, are paralleled by a sense of the unifying trends of late 19th-cent. mathematics, a development from which 20th-cent. mathematics has in great degree been departing. In 1900 he looked to the philosophies of number based on the theory of infinite sets to dispel past difficulties in the continuum of analysis. Though suspicious of logicians, he could not ignore work like Hilbert's postulational discussion of geometry, 1899.

HILBERT. At an international congress of mathematicians in Paris, 1900, David Hilbert (1862–1943) proposed 23 mathematical problems for the 20th cent. He agreed that the arithmetical continuum and non-Euclidean geometry were the 2 greatest achievements of the 19th cent. His 1st problem for the new era dealt with the real-number continuum and related to the axiom of choice of

Ernst Zermelo (1871–1956). It asserted the existence, given a set of mutually exclusive nonempty sets, of a set having only 1 element in common with each of the given sets. Kurt Gödel (b. 1906) proved the consistency of this axiom, 1940, and Paul Cohen (b. 1934) showed its independence of other axioms in a specified system of set theory. Hilbert's 2nd problem raised the question of the consistency of the axioms of arithmetic. Russell's and Whitehead's *Principia mathematica*, 1910–13, showed pure mathematics to be derivable from a few logical principles, but only with Gödel's theorem of 1931 was Hilbert's problem answered. Gödel showed that the axioms of a system are never sufficient to prove or disprove every statement within that system; a metasystem is always required. Hilbert's *Grundlagen der Geometrie*, 1899, provided an axiomatization for geometry to match the earlier development in other branches of mathematics.

BROUWER. From 1907 on L. E. J. Brouwer (1882–1966) attacked the logical and formal bases of mathematics supported by Russell and by Hilbert. Brouwer's intuitionism insisted, for example, that the use of indirect proof in transfinite arithmetic is invalid because uncertain. He denied the logical law of the excluded middle. In 1918 Brouwer was joined by Hermann Weyl (1885–1955), and their attacks could not be met satisfactorily by Hilbert.

LEBESGUE. In a less philosophical vein Henri Lebesgue (1875–1941) eschewed generalism for more detailed development. His most striking creation was the Lebesgue integral, 1902, which reconstructed the field of integration, substituting a sense of point correspondence for smooth variation.

FRÉCHET. With Hilbert, Maurice Fréchet (b. 1878) is responsible for the modern generalizing and abstraction of set theory and of space. From 1904 to 1910 Hilbert developed the formal concept of space named for him. Around 1906 Fréchet generalized the methods of calculus of variations through his functional calculus. Another generalizing tendency was the creation of topology,

especially by Brouwer with his invariance theorems, 1911, and a fusion of methods from Cantor and Poincaré. In the succeeding half-century topology moved from a geometrical character to an algebraic under the influence of work in the U.S. The period between the 2 world wars saw an abstraction in algebra as well. Since World War II the development of homological algebra, a topological version of abstract algebra, has taken place, with the 1st book on the subject, 1955, by Henri Cartan (b. 1904) and Samuel Eilenberg (b. 1913).

PROBABILITY, STATISTICS, AND THE COMPUTER AGE. Perhaps the most popularly known area of modern mathematics is probability and statistics. In 1901 J. Willard Gibbs published his *Elementary Principles in Statistical Mechanics*, and Émile Borel (1871–1956) published a basic text in probability theory in 1909. In physics, genetics, and elsewhere the field found applications as its axiomatic foundations were worked out (Hilbert's 6th project). The use of high-speed calculating machines to solve problems in statistics and probability theory has revolutionized 20th-cent. mathematics. Beginning with the experiments of Charles Babbage in the 1830's, calculators and computers have become progressively more efficient and sophisticated (p. 805, above). Two men deeply involved in generalizing the mathematical implications of the computer revolution were John von Neumann (1903–57) and Norbert Wiener (1891–1964). Neumann assisted in the development of computer capabilities during and after World War II and was largely responsible for the extended application of finite mathematics in the social sciences. Among his earlier work were the recognition of Hilbert space as the framework for quantum theory, the solution of Hilbert's 5th problem for compact groups, and basic work in the foundations of mathematics. His later work included a theory of automata. Wiener had earlier assisted in the creation of the modern theory of linear spaces. His *Cybernetics*, 1948, established a new subject, the study of control and communication in both machines and living beings.

Classical Physics

MECHANICS

NEWTON. The basis of classical dynamics lies in Newton's *Principia*, where one finds under "Definitions" and "Axioms" the fundamentals of the new mechanics. Of 8 definitions, the first 4 define mass, momentum, inertia, and impressed force. There follow descriptions of absolute time and absolute space, necessary prerequisites for the definitions established as the 1st 2 laws, or axioms, of motion. The 1st is the law of inertia, the 2nd finds alteration of motion proportional to the motive force impressed and in the direction of the impressed force. The 3rd law of motion sets action equal to reaction. Determined empirically, this law describes conservation of momentum. In the last book (III) of *Principia*, Newton derived the law of universal gravitation. It was shown to be deducible from Kepler's 2nd and 3rd laws via 4 "Rules of Reasoning in Philosophy." These rules embodied the new world outlook of the 17th cent. While it is possible to see the law of gravitation as a simple deduction from empirical data, it is historically more correct to see Newton's reasoning as a hypothetico-deductive process from the hypothesis of the inverse-square law of gravitation. In any case, he made no special hypothesis for the mechanism of gravitation. More than just a mathematical law, universal gravitation was conceived as a physical hypothesis, a force the detailed explanation of which he guessed at only in the concluding General Scholium of *Principia*.

D'ALEMBERT. One of the quarrels ensuing from *Principia* was the exact nature of "quantity of motion." In the *Traité de dynamique*, 1743, d'Alembert maintained to be fruitless the question whether the force of a body in motion is proportional to mv or mv^2 . He not only clarified the difference between the 2; he considered "forces inherent in bodies" to be "obscure and metaphysical." D'Alem-

bert preferred a more positivistic program for mechanics.

D'Alembert's principle was 1st elevated to the status of a unifying principle by its namesake, although it had already been applied in more limited fashion by Hermann, 1716, and Euler, 1740. By this principle the general dynamical problem became the discovery of the motion of each body in a system where a particular motion is impressed on each, while the interference of other bodies prevents direct transmission of the motion. D'Alembert's solution used analysis of each motion into a part having a direct effective transmission and a part effecting no change in the body. The sum of the former parts will describe the collective motions actually occurring in the system of bodies. Lagrange developed a more practical means of applying this principle.

LAGRANGE. Lagrange summarized and analyzed the 4 principles of dynamics. The conservation of *vis viva*, he observed, originated with Huyghens. The conservation of motion of the center of gravity was shown to be Newton's principle. The conservation of moments, discovered by Euler and Daniel Bernoulli, was found to be a generalization of a Newtonian theorem. Maupertius' principle of least action appeared to Lagrange as vague and arbitrary, and he opted for Euler's alternative version, the integration product of $m v d s$.

The basic principle of statics, the principle of virtual displacements, was 1st perceived in its universal applicability by Johann Bernoulli, who mentioned it in a letter of 1717. Lagrange, in his *Mécanique analytique*, 1788, asserted "that all the general principles which may still be discovered in the science of equilibrium, will be only this same principle of virtual velocities." He saw it to be a general formula encompassing all problems of equilibrium. Lagrange's deduction, that $P\alpha + Q\beta + R\gamma + \dots = 0$ defines equilibrium, used the principle of the pulley.

According to Ernst Mach, the Lagrangian demonstration classifies as discernment of a principle rather than as logical deduction.

HERTZ. Among basic systems of mechanics, that of Heinrich Rudolf Hertz (1857-94) in *Die Principien der Mechanik in neuem Zusammenhange*, 1894, suggested a return to a Cartesian view of the world, wherein the concept of force is eliminated and space, time, and mass alone are the necessary concepts for a mechanics in the world described by Maxwell's equations. The single basic principle of Hertzian mechanics was a combination of the law of inertia and Gauss's principle of least constraint (applied through connection of masses). While the principle was new in form, the origins were in Lagrange's equations. Hertz's geometrical approach to mechanics was the last attempt to carry out a Cartesian program via the traditional concepts of space and time. A revolution in those concepts led the way to the geometrical approach of relativity theory.

PROPERTIES OF MATTER

NEWTON. Perhaps the most controversial property of matter in the Newtonian system was the force of gravitation. Newton himself was rather careful to avoid attributing any such intrinsic force to matter. For him gravitation in "experimental philosophy" was the deduced result from phenomena. Gravitation simply described a situation, the cause of gravitation he professed not to know. His successors were not always as careful. A property of matter of 1st importance in Newton's system was mass, statically defined at the beginning of *Principia*. Ernst Mach supposed a definition of mass to be an undesirable premise and attempted to base the logical deduction of the laws of motion on bodies rather than mass. For Newton acceleration derived from bodies rather than mass would have been a dubious hypothesis. In the law of gravitation Newton finds gravitational mass equivalent to inertial mass almost by accident. This equation is basic in relativity theory.

CAVENDISH. In 1789 the direct, experimental determination of the law of gravitation was made by Henry Cavendish (1731-1810). A simple apparatus gave data for the horizontal attraction of 2 large leaden balls for 2 small spheres suspended from the ends of a bar. In terms of the measured times of oscillation of the suspended spheres, Cavendish was able to compute the density of the earth.

YOUNG. The elasticity of matter, defined by Robert Hooke and put in successively improved mathematical form by Poisson, Navier, and Cauchy, was neatly defined in its common form by Thomas Young, 1807, who coined the phrase "modulus of elasticity." Young's modulus gives characteristic coefficients for materials deformed by tension or pressure, as in a wire or a column, the coefficients relate variation in force applied to change in length of material.

AMPÈRE. André Marie Ampère (1775-1836) was responsible for the 1st clear statement of the formal distinctions between particles, molecules, and atoms as 19th-cent science understood them. "Particle" referred to the smallest portion of a body still having the same gross characteristics as the body itself (e.g., solidity). Molecules were the subdivisions of particles and were considered to be held in spatial relationships with each other by a combination of attractive and repulsive forces, including gravitation. The atoms were understood as the "material points" from which attractive and repulsive forces in the molecule emanated.

HEAT

BLACK. Beyond such general concepts and experimental determinations of material properties as outlined above, the areas of heat, light, electricity, and magnetism were extensively explored in late 18th- and 19th-cent physics. As early as Galileo, heat had been explained as the result of atomic motion. On the other hand, Lavoisier had considered "caloric" as a substance, albeit weightless, in his quantitative approach to chemistry. From Joseph Black (1728-99) and his *Lectures on the Elements of Chemistry*, 1803, came

accounts of the discovery of specific and latent heats. Recounting his work of 1760, he treated heat as a fluid substance ("caloric"). Clearly distinguishing temperature from quantity of heat, he saw specific heat in terms of the amount of "caloric" necessary to raise the temperature of a certain mass by 1°C . About the same time he recognized the latent heat in bodies, the amount of "caloric" which must be dissipated from a body in one state before it will change to another denser state at the same temperature. However, Black's experiments did not suggest to him the consequent difficulties in maintaining a materialistic, or substantial, theory of heat.

RUMFORD. Benjamin Thompson, Count Rumford (1753-1814) was the 1st to quarrel with the caloric theory of heat. He noted, 1798, the appearance of heat in the boring of cannon, recording the creation of enough heat to boil $18\frac{3}{4}$ lbs. of water in $2\frac{1}{2}$ hrs. It became apparent that the heat increase was generated by friction alone. He concluded that "any thing which any insulated body, or system of bodies, can continue to furnish *without limitation*, cannot possibly be a *material substance*; and it appears to me to be extremely difficult, if not quite impossible, to form any distinct idea of any thing, capable of being excited and communicated, in the manner the heat was excited and communicated in these Experiments, except it be MOTION."

GAY-LUSSAC. Louis Joseph Gay-Lussac (1778-1850), while a demonstrator at the École Polytechnique, showed experimentally, 1802, that any gas between the freezing and boiling temperatures of water will expand or contract at the same rate as any other gas with a given amount of heating. The results encouraged scientists in the current viewpoint that gases are harmoniously and simply elastic. Upon Gay-Lussac's work was founded J. R. Mayer's hypothesis that the work spent in the compression of a gas is exactly the mechanical equivalent of the heat evolved.

DULONG AND PETIT. Further unification of heat theory, in terms of atomic theory, was accomplished by the experiments, 1819, of Pierre Louis Dulong

(1785-1838) and Alexis Thérèse Petit (1791-1820) on a selection of solids. The results showed a close correlation of specific heats and relative atomic weights of the various simple substances; the specific heats varied inversely as the relative atomic weights. This led directly to the law adopted by Dulong and Petit that "the atoms of all simple bodies have exactly the same capacity for heat."

FOURIER. Joseph Fourier, following Lavoisier's line of reasoning, tended to see heat as material rather than the product of mechanical forces. Avoiding the question of causes of factors in heating, he observed general relationships among these factors and expressed them in equations analogous to the general equations of dynamics. Experimentally he noted the necessity of temperature difference for the motion of heat. The analogy of heat flow to water flow was unimportant for Fourier's work, but it was central in the genesis of Carnot's *Réflexions sur la puissance motrice du feu*, 1824.

CARNOT. Nicolas Léonard Sadi Carnot (1796-1832) anchored his thought on the notion of the impossibility of a perpetual motion. Thus the transmission of heat from an area of higher temperature to one of lower temperature created work, but at least that much work was required to recreate the original temperature differential. Carnot introduced the idea of a complete cycle of a working material and the correlative reversibility. At the same time he recognized that no engine could have a greater efficiency than a reversible engine: a perpetual motion machine is impossible. Later in life Carnot abandoned the material theory of heat for the mechanical and even calculated a mechanical equivalent of heat. Carnot's work, while referring only to heat, contained the ideas behind the 1st 2 laws of thermodynamics, i.e., the conservation, equivalence, and convertibility of energy, and the availability of energy.

MAYER. Julius Robert Mayer (1814-78) can be credited with the 1st published statement of the equivalence of heat and mechanical energy, 1842, as well as quantitative determinations thereof. Mohr had made a general philosophical statement of the principle in the preceding decade.

Mayer stated that the work spent in compressing a gas is the exact mechanical equivalent of the heat evolved. He based his view on Gay Lussac's work. The philosophical matrix of Mayer's version of the principle of the conservation of energy caused tardy acceptance of his results.

JOULE. Late recognition was also the response to James Prescott Joule's (1818–89) experimental statement of the mechanical equivalent of heat, 1813, making it clear that the principle of conservation of energy was involved. Yet like Mayer, Joule had to await Kelvin's recognition of his work, 1817, before seeing its wide acceptance. Joule founded his reports on painstaking and extensive experiments more so than Mayer—and published his most famous and complete memoir on the equivalence of heat and work in 1850.

HELMHOLTZ. Hermann von Helmholtz (1821–94) composed the classic statement of conservation of energy in *Über die Erhaltung der Kraft*, 1847. His pamphlet introduced a correct mathematical expression of the principle and interrelated the various forces studied in physics. The treatise concluded with an assertion of the universality of the principle of conservation of "force," including even the heat of living beings. His paper was refused (as Mayer's had been) by Poggendorff's *Annalen*, because it offered no new data and suggested a return to the more philosophical trend from which physics had so recently escaped. In fact, Helmholtz persisted in the use of the ambiguous term "force," although his mathematical statement was quite clear. Only with Kelvin's adoption of Young's term, "energy," and with Rankine's rephrasing of the principle to one of "conservation of energy" was ambiguity completely removed.

CLAUSIUS. Rudolf Clausius (1822–88) published in 1850 a paper which paralleled Kelvin's contemporary perception of the importance of "loss" of energy. To Mayer, Joule, and Helmholtz, it had not occurred to ask how the loss and waste of power in nature occurs, if energy is not only conserved but converted to work. Only Carnot (after 1824) had faced the problem of the inability to convert all the heat involved into work; it occurred to

him that heat might pass from a hotter body to a colder without the creation of any motion, though he made no real study of this issue. Clausius, however, turned his considerable mathematical skills—he was not a great experimenter—to the problem of energy lost during conversion of energy to work. He pointed out that maximum work is gained by heat flow when the 2 bodies of different temperatures never touch. The full consequences of the 2nd law of thermodynamics, correctly stated by Clausius in 1850, were synthesized in his 1865 paper, which introduced the term "entropy" and developed its properties. Clausius concluded that (1) the energy of the universe is constant, and (2) the entropy of the universe tends toward a maximum.

KELVIN. It was William Thomson, Lord Kelvin (1824–1907), who first attempted, 1818, to establish an absolute temperature scale wherein all degrees would have the same value, so that a decrease of a given number of degrees at any temperature would always have the same mechanical equivalent. A more correct scale, that now current, was described by Kelvin in 1851. At the same time he made his own statement of the 2nd law of thermodynamics. Kelvin first saw the necessary interrelationship of the 1st 2 laws in physics. Only the acceptance of both at once would explain the impossibility of a perpetual motion machine, since energy must be available before useful work can be done. Mathematically as well as conceptually he made the issue clear. Along with Clausius, Kelvin saw the universal significance of the constant tendency toward dissipation of energy.

ANDREWS. In experimental physics the work of Thomas Andrews (1813–85) on the continuity of gaseous and liquid states, 1863, was closely related to the mechanical theory of heat, which most English physicists favored. Andrews identified as a "critical temperature" that at which a gas and a liquid appear to form a single-phased fluid, unidentifiable in whole or in part as distinctly gas or liquid. Increase in pressure made no difference.

BERNOULLI AND BROWN. The mechanical theory of heat owed much to the development of a kinetic theory of

gases. Daniel Bernoulli (1700–1782) gave the 1st successful application of the kinetic theory in his *Hydrodynamica*, 1738. Giving a quantitative account of the force necessary to compress a gas, he credited the increase by heat of air's elasticity to an increased motion of the particles of air. Observation of the effects of these particulate motions in fluids was made by the botanist Robert Brown (1773–1858), who reported Brownian motion in 1827 on the basis of microscopic observation of the motions of sub-particles of pollen.

MAXWELL. In 1860 James Clerk Maxwell (1831–79) published his 1st statement of the distribution of molecular velocities. He later improved on the calculations previously given. With direct reference to heat, "Maxwell's demon" was an instructive device for pointing out the basis in distribution alone for heat "flow."

GIBBS. From 1871 on Josiah Willard Gibbs (1839–1903) developed a very abstract form of thermodynamics, quite independent of any association with heat engines. With respect to systems of different chemical or physical "phases," Gibbs devised his Phase Rule, 1877, $F = C - P + 2$. While Maxwell was aware of Gibbs's work and made good use of the latter's development of 3-dimensional graphing of the different thermodynamic quantities, it was not until Ostwald's translations of 1892 that Gibbs's work became generally available. Meanwhile Maxwell and Ludwig Boltzmann (1841–1906) were developing statistical mechanics on the basis of probability theory, showing the strong tendency of molecules to approach a norm of activity. Improvements by Maxwell and Boltzmann over the former's distribution law of 1860 have become the basis of thermodynamics. In 1877 Boltzmann pointed out the relationship of probability to entropy, a direct and striking relationship, indicating that increase in entropy is the most probable state of the universe.

LIGHT

HUYGHENS. Huyghens' *Traité de la lumière*, 1690, had posited a wave theory

of light, but with such flaws that it was overwhelmed by Newton. Huyghens adopted a geometrical view of propagation of light in waves in order to explain the most interesting phenomenon of double refraction in Icelandic spar. Although his theory had the philosophical merit of reinforcing Fermat's mathematical deduction of the law of refraction from the principle of economy, his waves were not periodic and could not account for the extensive phenomena reported by Newton in thin films.

NEWTON. On the other hand, Newton's *Opticks*, 1704, showed in irrefutable experimental fashion the composition of white light and an explanation of Newton's rings which seemed complete. Yet his theory involved a particulate view of light. This required such peculiarities as the "fits" of easy reflection and easy transmission for the rings, the possession of "sides" by light particles to explain polarization, and a mechanism for refraction which made light travel faster in denser media (as with Descartes also). Furthermore, Newton took very poor note of the data of interference patterns described in Giamaldi's *De lumine*, 1665, for Newton reported and explained only the internal fringes.

YOUNG. The interference patterns in thin films and especially in experiments with slits and knife edges were the crucial phenomena leading to the reintroduction of a wave theory by Thomas Young (1773–1829) in his papers of 1801–4. Although Young had a firm grasp of the principle of interference, the key to the success of wave theory, he was widely ignored, because of the authority of Newton, until the appearance of Fresnel's work over a decade later.

MALUS. Between the work of Young and Fresnel there appeared the significant observations of Étienne Louis Malus (1775–1812) on polarized light. Huyghens and Newton, each through his own theory, had observed and explained polarization in connection with doubly refractive crystals. Malus, a Newtonian, showed that polarization occurs in a variety of substances and is even found in reflection as well as refraction. Not until 1817 did it strike Young that a transverse

vibration, perpendicular to the direction of propagation, would account for the phenomena in terms of wave theory.

FRESNEL AND ARAGO. Beginning in 1815 Augustin Jean Fresnel (1788–1827) delivered a series of papers on diffraction and the light fringes caused by interference. Pressed by minds like Laplace and Poisson, Fresnel applied mathematical analysis in order to obtain more exact and persuasive results in favor of the wave theory of light. Although Arago sympathized with the undulatory theory, he refused to have his name attached to the article, 1821, resulting from his work with Fresnel on the interference of polarized light. Fresnel's commitment to the notion of a wave transverse to the longitudinal propagation was more than Arago wished publicly to espouse, because of the entailed, paradoxical nature of the ether. The Fresnel-Arago view triumphed, however, even in the face of opposition from scientists such as Biot and Brewster.

RÖMER, FIZEAU, AND FOUCAULT. An important constant in the study of physical optics is the speed of light. Olaf Römer (1644–1710) 1st determined a value by studying the eclipses of Jupiter's moons, 1676; the eclipses occurred late when the earth was farthest in its orbit from Jupiter, and they happened early when the earth was nearest in its orbit to Jupiter. Bradley's discovery and explanation, 1728, of the astronomical aberration of light (p. 903, above) corroborated Römer. In 1838 Arago described a device for measuring the speed of light. Both Fizeau, 1819, and Foucault, 1862, actually constructed measuring devices on the basis of Arago's ideas. The principle behind Foucault's method was the observation of the fixed image of a moving image. His results indicated a velocity of 298,000 km. per sec. By 1926 Michelson had achieved a determination of 299,796 km. per sec.

STOKES. The phenomenon generally known as fluorescence was 1st correctly described by George Gabriel Stokes (1819–1903) on the basis of his experiments with fluorspar and other organic substances. Carefully distinguishing false from true "internal dispersion," Stokes pointed out the change of refrangibility

of light involved. His memoir, 1852, indicated that such a change is always in a direction of less refrangibility; this led him to the discovery of spectral lines for light normally beyond the visible, violet end of the spectrum. On the most basic level Stokes's account suggested a way to understand mechanically the interaction of the ether and the parts of ponderous bodies in the transmission of light.

KIRCHHOFF. A full understanding of spectrum analysis came with the joint paper, 1859, on Fraunhofer lines by Gustav Kirchhoff (1824–87) and Robert Wilhelm Bunsen (1811–99), although Kelvin claimed that Stokes had recognized the relationship of sodium vapor lines and those of the sun's atmosphere as early as 1849. Kirchhoff noted that a sodium flame emits only yellow light, having the same refractive index as the Fraunhofer D line in the solar spectrum. Further experiment proved that sodium vapor absorbs the same light as it emits. While Euler had already speculated on a general law for the relation of emitted and absorbed light, Kirchhoff saw correctly the relevance of a heat law for thermal equilibrium between absorption and emission. He concluded that "colored flames in the spectra of which bright lines present themselves, so weaken rays of the color of these lines, when such rays pass through them, that in place of the bright lines, dark ones appear."

BALMER AND RYDBERG. Johann Jakob Balmer (1825–98) was the 1st to set out a law for the distribution of the spectral lines discovered in the 19th cent. Balmer's formula treated the wave lengths of the 4 prominent lines in the hydrogen spectrum. The ratios of the wave lengths were given by small numbers. A constant was determined as a multiplier for each of the ratios in order to get the wave lengths. From his formula, $m^2 / (m^2 - n^2)$, where m and n are integers, he found a series of ratios defining very closely the 9 spectral lines definitely assigned to hydrogen. Johannes Robert Rydberg (1854–1919) introduced a formula, $n = n_0 - \frac{N_0}{(m + \mu)^2}$, in 1890. N_0 represented the Rydberg constant, applied in common to all elements. This constituted an ad-

vance beyond Balmer's formula of 1896, wherein the constants varied with each element.

MICHELSON AND MORLEY.

Among the most well-known experiments on light was the series of attempts made by Albert Abraham Michelson (1852-1931) and Edward Williams Morley (1838-1923) to measure the motion of the earth relative to the ether. Their paper of 1887 posed the problem of explaining astronomical aberration of light in terms of Fresnel's undulatory theory, which required the ether to be at rest except in the interior of transparent media. Aberration could indeed be explained by the theory. Michelson and Morley proposed to test the theory itself. Their results, given in terms of the displacement of interference fringes, indicated displacements much less than $\frac{1}{8}$ of those predicted by theory. The experiments showed a failure of Fresnel's theory to explain aberration and similar failure on the part of alternatives suggested by Stokes and by Lorentz. It should be noted that the Michelson Morley experiment was not a basis for Einstein's special relativity theory; Einstein became aware of the experiment after formulating his theory.

ELECTRICITY AND MAGNETISM

GRAY. The study of electricity and magnetism became a science only in the 18th cent., and in electrostatics the century saw the establishment of a complete mathematical and physical theory. Stephen Gray (d. 1736) initiated the steps leading to a scientific theory by discovering, 1729, that "electrick vertue" can be transmitted from a charged body to other bodies. The ability of certain substances, especially metals, to conduct electricity was recognized, and Gray showed that "electric fluid" acted only at or near the surface of a conductor.

DU FAY. At midcentury the electric fluid was generally thought to comprise an area, filled with electric effluvium, around the electrified body. Charles François Du Fay (1698-1739) explained the

attraction and, subsequent to contact, repulsion of gold leaf for an electrified glass tube by a 2-fluid theory, 1733-34. He reasoned that the leaf acquired electric force by contact with the glass; the gold leaf then became surrounded by its own effluvium and repelled the effluvium, or vortex, around the glass. Noting, further, that a glass rod and a resinous rod attract each other when electrified and repel their own kinds, Du Fay suggested separate electrics, named vitreous and resinous. The actual flow of electric fluid was suggested by Musschenbroek's discovery, 1745, of the Leyden jar. William Watson (1715-87), a London apothecary, interpreted the shock received in making physical contact between the charged gun barrel and the outside of the jar as a simple transference of "electrical aether," 1746. No creation or destruction of electric was suggested, only the accumulation, depletion, and flow of a substance possessed by all bodies.

FRANKLIN. Benjamin Franklin (1706-90) theorized, 1747, that electric charge is conserved when flow of electric takes place. He interpreted his experiments to show that a differential in a single electric accounted for electrical force. Two repelling glass rods were similarly charged, while 2 attracting rods had one with a surplus of electric and the other suffering an actual deficiency. When Franklin recognized that 2 resinous, charged rods also repelled each other, he was disconcerted, for he saw vitreous electricity as a surfeit of electric, while resinous was only an absence. How could 2 bodies repel by virtue of a lack of electric? Franklin also found himself in an ambiguous position over the existence of an electric effluvium, as a means of conveying charge between bodies. His interpretation of the Leyden jar experiment disposed him to an action-at-a-distance theory. On the other hand, the attraction of a charged body for smoke from heated resin suggested that electric did flow into and suffuse the atmosphere around the charged body.

AEPINUS. Problems in Franklin's model of electric action were worked out by Franz Ulrich Theodor Aepinus (1724-1802). Following the 1-fluid theory, he

explained repulsion of resinously charged bodies as mutual repulsion by matter itself, since neutral bodies were matter plus electric, and positive charge required a surplus of electric. Aepinus' generalization, 1759, of the observation that glass is impermeable to electric led to dismissal of the effluvial view of propagation of electric force. Noting that air and other bodies were nonconductors he reasoned that electric, shown by Gray to reside only on the surface of conductors, acts at a distance across intervening air. Action at a distance also was shown to explain electric (electrostatic) induction of charge. Joseph Priestley (1733-1804), reinforced by John Robison in 1769, 1st hypothesized, 1767, electric force to be like gravitation, i.e., inversely proportional to the square of the distance and without effect on a body within the shell of electric charge.

COULOMB. The inverse-square law for the force between magnetic poles was 1st discovered by John Michell (1724-93) in 1750. To an understanding of both electricity and magnetism Charles Augustin Coulomb (1736-1806) made contributions. Using a torsion balance of his own invention, he verified Priestley's inverse square law. Coulomb, reasoning from the model of physical and chemical processes, revived the 2 fluid theory of electricity in the new terms of Aepinus—action at a distance. In the study of magnetism Coulomb overthrew the vortex theory and verified Michell's law of inverse squares.

POISSON. Mathematical maturity came to electrostatics rapidly through the efforts of Simeon Denis Poisson (1781-1842). Accepting the 2-fluid theory, he applied Lagrange's function for the attraction of spheroids to electrical considerations, 1813. Poisson gave a solution to the electrostatical problem of determining surface density on 2 charged conducting spheres at any distance apart. In the study of magnetism he defined mathematically the magnetic potential and gave a law for induced magnetism in a sphere placed in a magnetic field, 1824. Four years later, George Green (1793-1841) generalized and extended the electrical and magnetical investigations of Poisson.

GALVANI. The distinction of electrostatics from electrodynamics did not take place until the end of the 18th cent., since electrodynamics had not aroused serious interest previously. Luigi Galvani (1737-98), at 1st by accident, 1780, observed the sensitivity of a frog's cranial nerve to metallic contact. Thinking at first that electricity caused the muscular contraction, he made repeated experiments to learn, 1786, that a metallic contact between nerve and muscle produced the contraction. While some supposed the effect to be caused by a new animal electricity, Galvani felt the electric fluid in the nerves was the same as that of the Leyden jar.

VOLTA. Alessandro Volta (1745-1827) refused to countenance the hypothesis of an electrical fluid in the nerves. In 1800 Volta suddenly made galvanic action of more interest by intensifying the electric force. This was accomplished by a connected series of units, each unit comprised of discs of copper, zinc, and wet pasteboard in that order. The resulting "pile," it was observed, gave an indefinite number of shocks in succession, apparently inexhaustible in its electric charge. Volta conceived the charge to be a result of electric tension between the 2 kinds of metal, this "tension" included confusedly the modern notions of charge and potential. The necessity for moist connecting discs he also saw, though not understanding the mechanism of the pile.

As early as 1796 Giovanni Fabroni (1752-1822) noted the partial oxidation of 1 of a pair of metals in a vessel of water with a circuit completed between them, he concluded that galvanic action was connected with chemical action. Learning of Volta's pile, William Nicholson (1753-1815) and Anthony Carlisle (1768-1840) repeated the Voltaic experiments and noticed, 1800, the production of gas where a drop of water was added on the upper plate to secure good contact. Succeeding experiments with the wires from both ends of the pile in a tube of water showed them that hydrogen appeared at 1 wire and oxygen at the other. Late in the same year Humphry Davy (1778-1829) found that pure water permits no

current between the plates, thus supporting Fabroni's theory of a necessary connection between chemical and electrical activity. Davy proved that oxidation is necessary for establishment of Voltaic electricity. His explanation, however, was the reverse of actuality, for he believed the chemical changes responsible for restoring an equilibrium of electrical charge, while the contact of metals produced electromotion by disturbing the equilibrium.

OERSTED. From early in the 18th cent. a connection between electricity and magnetism was suspected. In the early 19th cent. Hans Christian Oersted (1777-1862) set out to discover precisely what relationship might exist. By 1820 he was able to announce the qualitative effect of a closed electric circuit on a magnetic needle—the tendency of the current to orient the needle perpendicular to the direction of flow, oppositely as the wire was placed above or below the needle. Oersted explained the effect as the force of electric conflict in space on material magnetic particles, which alone are impenetrable and resistant to that conflict. Later in the same year, Jean Baptiste Biot (1774-1862) and Felix Savart (1791-1841) announced precise results of repetitions of Oersted's experiments. The force on the magnetic pole was found to be exactly at right angles both to a perpendicular from the wire and to the wire itself; the intensity of the force was found to be inversely proportional to the distance. Contrary to Oersted, Dominique François Jean Arago (1786-1853) spoke of action at a distance in reporting, 1820, that iron filings are attracted; that steel can be completely magnetized by a current was also reported. In 1825 Arago described a phenomenon which presented for some time afterward a problem of interpretation. This was the deflection of a magnetic needle by a parallel rotating plate of some conductor; the deflection increased with the velocity of the plate.

AMPÈRE. André Marie Ampère (1775-1836) immediately turned to extending Oersted's discovery when it was announced in Paris. He quickly discovered,

1820, that between parallel currents there is attraction when the currents flow in the same direction, while repulsion occurs if the currents flow oppositely. In 1823 Ampère published a brilliant paper in which he derived a mathematical expression for the force between two elements of circuits, assuming the force to act along the line joining those elements. Regarding his formula as the foundation of quantitative electrodynamics, he saw it as the analogue of the law of gravitation in mechanics. Ampère's assumption of force acting along the line joining 2 elements, embedded in an action-at-a-distance matrix, was exactly what could be shown to be false by 1900. Furthermore, the tendency to discuss discrete electric charges in Ampère's theory was an embarrassment to Maxwell's field theory, despite the success of the latter in predicting a finite velocity of propagation for electromagnetic waves. Finally, Heaviside insisted, 1888, that Ampère's foundation for electrodynamics is not to be found in his law of force between current elements, but in his formula for the magnetic force of an element of a conductor supporting current in a magnetic field. Yet the work of Ampère remained basic; witness its extension in the force laws of Clausius and Lorentz.

SEEBECK. Quite different from Volta's order of electromotive power of metals was the thermoelectric order discovered in 1822 by Thomas Johann Seebeck (1770-1831). He noted that only heat, no intervening liquid, is required to establish a circuit in a ring composed of copper and bismuth, or other pairs.

OHM. Whether thermoelectric or electrochemical, currents were studied more and more for their relative efficacies. Davy's paper of 1821 explored fully the significance of length and cross-sectional area of conductors. It was left to Georg Simon Ohm (1787-1854) to complete a theory of Voltaic circuits by considering the battery's power. On an analogy with heat flow in a wire, Ohm discussed electric flow, leading up to a determination of "driving power" of the battery in terms of a differential between 2 points in a circuit; the analogue was temperature.

Via a confusion of electrostatic potential with electroscopic force of an open pile, Ohm was led to his correct equation of current in a wire with the product of conductivity of the wire and electroscopic differential between the terminals. The analogy between electroscopic difference and temperature was illuminating, and was realized to link electrostatic with electrodynamic theory.

FARADAY. Michael Faraday (1791–1867) is commonly accounted the greatest experimentalist of the 19th cent. in electrical and magnetical research. His *idée fixe* was the lines of force suggested by the curves followed by iron filings on paper over a bar magnet. In 1832 he showed that induction of current is the production of a definite electromotive force, depending only on the intersections of the wire and the magnetic curves: currents induced under the same circumstances in different wires were proportional to the conducting powers of the wires. His explanation of current induction was: "Whether the wire moves directly or obliquely across the lines of force, in one direction or another, it sums up the amount of forces represented by the lines it has crossed . . . the quantity of electricity thrown into a current is directly as the number of curves intersected." In 1833 Faraday showed that all known effects of electricity, whether physiological, luminous, mechanical, or other, could be obtained equally well from static and current electricity. This indicated the similarity of process in the wire of a completed Voltaic circuit and the wire discharging a condenser. Later in the same year he reformed a branch of electrochemistry by proving that the action of the metals in electrodes is not integral to the decomposition of solutions by currents; his theoretical account indicated why the evolved substances appear only at the terminals, why the substances are often not retained at the terminals, and why compounds, not mixtures, are separated by currents. He even speculated that the electricity which flows during decomposition in a Voltaic cell is the exact equivalent of the electric power possessed by the atoms separated at the

electrodes. In 1838 Faraday developed a full theory of electrostatic induction on the model of magnetic induction. His explanation involved propagation of electrostatic action via a medium in a way similar to the propagation of currents. After a 1-year interval of rest, he resumed research and entered the field of light polarization. His *Thoughts on Ray Vibrations*, 1846, show a clear tendency toward an electromagnetic theory of light. Faraday's major contributions in the following years were in the area of diamagnetic and paramagnetic action, especially in relation to axial orientations of crystals. The essential thrust of Faraday's work appears in his formation of a clear, physical version of field theory. He came to conceive of all matter as composed of space-filling forces, a so-called atom being no more than a point center for a field of force. Crediting Boscovich with this basic idea, Faraday conceived of no true vacuum and no ultimate particles; action at a distance was discarded.

KELVIN. Although Faraday constantly fell back on his physical model of electric action propagated in a continuum, it was William Thomson (Lord Kelvin) who first introduced this same model, 1842, to mathematical physics. Thomson's argument was by way of analogy between distribution of electrostatic force, traditionally seen as action at a distance, and distribution of heat flow, a phenomenon of continua. His memoir of 1846 suggested a parallel between the propagation of electromagnetic phenomena and the transmission through an elastic solid of changes in elastic displacement.

MAXWELL. From Faraday's models and Thomson's mathematical analogies came the 1st memoir, 1855, of James Clerk Maxwell (1831–79). In this paper Maxwell 1st showed the physical significance of the operators *curl* and *div*, already introduced by Stokes. Maxwell's papers of 1861–62 gave a mechanical picture of the electromagnetic field. Thomson's view of magnetism as rotation was combined with Faraday's tubes of force; each unit tube of force was to be regarded as a single vortex, with the contained medium rotating about the axis of

the tube. His mechanism for current, electromotive force, and tension was extended to electrostatic phenomena. The electrostatic state was described as a displacement of particles from equilibrium, constant at a certain value. Maxwell generalized Faraday's displacement concept, which likened electrostatic and electrodynamic phenomena, but only in material dielectrics. For Maxwell displacement exists with electric force not only in material bodies but also in free ether. His full exposition of electromagnetic field theory came in 1864 (modified in 1868). A striking part of his theory was the inclusion of light with electromagnetic phenomena. He applied it accurately to the propagation of light in crystals, metals, and isotropic media. Maxwell's theory was strange and unacceptable to some like Kelvin, who saw electric current as transmission by a wire, rather than by the surrounding dielectric with the wire as no more than a guide for the current. More difficult for many to accept was the notion that all currents are closed, since a displacement current in the dielectric of a condenser would complete an apparently discontinuous current. Only the later success of Maxwell's equations within special relativity theory brought general acceptance of the displacement idea.

Experimental support for Maxwell began to appear in the 1870's. Kerr showed, 1875, that dielectrics under strong electrostatic stress become doubly refractive. In 1875-76 Helmholtz and Schiller showed that the pre-Maxwellian potential theory gave incorrect predictions for the action of a ring magnet on an unclosed current. H. A. Rowland (1848-1901) supported the Faraday-Maxwell equivalence of a moving electrified body and an electric current by his production, 1876, of a magnetic field when a charged plate was rotated (electric convection) parallel to fixed condenser plates above and below. In 1879 Edwin H. Hall demonstrated an additional electromotive force from the action of an electromagnet on a current passing across the lines of force. The details of the Hall effect gave further support to the increasingly accepted hy-

pothesis that magnetism is a rotatory, not a linear, phenomenon.

HERTZ. With Heinrich Hertz (1857-94), Maxwell's theory found its experimental justification. In a series of researches, 1887-90, Hertz studied the propagation of electric waves in air. On the basis of observed interference of electric waves in air and in a wire, he calculated the velocities in each. Electric waves in air were shown to be of finite velocity and of the same order of magnitude as the velocity of light. He also found electric waves to be reflected, refracted, diffracted, and polarized similar to light waves. In 1892 Hertz presented the various possible interpretations of action across free space. He favored the view that only polarizations exist, and such a fundamental state is the cause rather than the effect of electricity. Hertz concluded that Maxwell's position was a combination of this and the view that energy is present only in the medium, not in charges acting at a distance. Since both views are expressed by Maxwell's equations, both views were seen by Hertz as the same theory. Here he engaged in a positivist error, forgetting that there might be testable consequences of one theory differing from the other. In fact, relativity theory gave yet another interpretation of the equations, leading to different consequences from the interpretations of Maxwell and Hertz.

CATHODE RAYS. Under the heading of electrical studies, the investigation of the cathode-ray tube led to a totally different aspect of electrical action, the activity of discrete particles. Johann Wilhelm Hittorf (1824-1914) found, 1869, the cathode ray to be obstructed by metals, deflected by a magnet, and to travel in a straight line. Eugen Goldstein (1850-1930) noted that an extended cathode surface emits rays only as perpendiculars to the surface of the terminal; thus they could be focused. To William Crookes (1832-1919) was due the construction of the tube, thereafter named for him, in its modern shape. His experiments, 1879, showed the cathode ray to carry energy and also, he thought, to have momentum. Crookes's hypothesis, commonly accepted in England, interpreted

the cathode ray as a stream of electrically charged gas molecules. The German school of thought adhered to an electromagnetic-wave interpretation. Each school had experimental evidence for support. Against the ethereal-vibration theory were experiments by Jean Perrin (1870–1914) and J. J. Thomson (1856–1940). In 1895 Perrin found that a metallic cylinder which received the rays became charged with resinous electricity. Thomson pointed out that such electrification no longer occurred when a magnet turned the rays so that they no longer entered the cylinder. Yet it remained difficult to explain how charge-carrying particles of the type known could penetrate an aluminum film, as Philipp Lenard had shown cathode rays to do, 1894.

The application of magnetic fields to cathode rays suggested the solution to the dilemma in 1897 J. J. Thomson was impressed by the size of the deflection of the rays by a magnetic field; such particles should be much more massive than atoms. The year before, Lorentz had suggested

for the Zeeman effect an electric atom of $\frac{1}{1,000}$ the mass of a hydrogen atom; calculating the theoretical charge-to-mass ratio necessary to produce the effect, Larmor found it 2,000 times too small, since the hydrogen atom was the smallest conceivable particle with mass.

THE ELECTRON. Thomson's experiments, resulting in the epoch-making papers of 1897–99, showed deflection of the rays in an electrostatic as well as a magnetic field and computed the charge and mass of the particle as well as the charge-to-mass ratio. Though accepted with reticence, Thomson's hypothesis of the electron, about 1.4×10^{-3} the mass of a hydrogen ion, was well supported by ingenious experimentation. His model of the atom, 1904, was of a region of uniformly distributed positive charge, regularly interspersed (in terms of mutual repulsion) with the negative electrons. While the model was purely hypothetical, the discovery of subatomic particles was

Modern Physics

HEAT AND LIGHT

In 20th-cent. physics, the study of thermal radiation was responsible for initiating the most profound revolution in physical theory since the 17th cent. The relevant problem was a satisfactory theory to explain black-body radiation. In 1859 and 1860 Gustav Kirchhoff published papers showing the independence from the nature of bodies of the emission-absorption ratio of radiation. It was this universal aspect which much later attracted Planck. Kirchhoff's 2nd paper introduced the notion of a perfectly absorbent and emissive "black body." Yet not until 1895 were Otto Lummer and others able to construct black-body radiators. In the next few years Lummer and others determined accurately the spectra of black bodies. In 1894 Wien had already developed a theoretical displacement law,

indicating a general relationship for spectral distribution of black-body radiation with respect to temperature. Wien's radiation law of 1896 applied satisfactorily for high-frequency vibrations, but experiments reported in 1900 proved its incorrectness for low frequencies. Meanwhile, John William Strutt, Lord Rayleigh (1842–1919), made use of the equipartition theorem of statistical mechanics to derive an alternate law for low-frequency vibrations. The resultant Rayleigh radiation law, 1900, agreed with Wien's displacement and admirably accounted for the low frequencies where Wien's radiation law failed. But at high frequencies it would lead to the so-called ultraviolet catastrophe (after Ehrenfest, 1911); that is, at higher frequencies the energy density would tend to an infinite maximum. This contradicted experience.

Max Planck (1858–1947) recognized

the mutual limitations of Rayleigh's and Wien's radiation laws. His reaction was to interpolate between the 2 and ∞ to obtain a law applicable to both high and low frequencies. In its final state, presented to the German Physical Society on 14 December, 1900, Planck's¹ radiation law introduced the universal quantum constant h and combined views of continuously and discontinuously varying energy (an inconsistency first noted by Einstein in 1906). Most interesting about this revolution in physics—that energy exists in discrete “packets” represented by the constant h —was the tardy recognition of its significance. Planck repeatedly tried to fit the new formula into classical theory; he later referred to the initial postulation of h as “an act of desperation.”

In 1907 Einstein applied quantum theory to specific heat and showed its greater usefulness than the previously applied equipartition theorem. While classical theory predicted specific heat of solids to be independent of temperature, Einstein showed clearly that specific heat decreases with temperature and only appears to be independent at higher temperatures. This broadened applicability of quantum theory to molecular kinetic theory was largely responsible for Walter Nernst's support, 1911, of Planck's hypothesis and thereby for the holding of the 1st Solvay Conference, 1911, in Brussels. This conference marked the end of quantum theory as radiation theory. From Nernst's interest in molecular kinetic theory, from Bohr's enthusiasm over the conference proceedings (as reported to him by Rutherford), and from the growing recognition of the significance of Einstein's quantization of light, quantum theory soon became the new basis for the theory of matter.

In 1905 Einstein published a paper “On a Heuristic Viewpoint Concerning the Production and Transformation of Light” in which it was shown that a quantum view of light is the best (not necessarily the only) explanation for the behavior of high-frequency, low-density monochromatic radiation. Thus in the so-called photoelectric effect—the term photon was introduced in 1926 by G. N. Lewis—an increase in the frequency of incident light

brought an increase in the velocity of ejected photoelectrons; to increase the intensity of incident light gave corresponding increase only in the number of photoelectrons ejected. This theoretical result, suggested by Lenard's experiments of 1902 and verified by A. L. Hughes in 1921, was contrary to all expectations in classical electromagnetic theory. Expansion of this hypothesis of light quanta to a view allowing both particulate and undulatory characteristics for light was tentatively realized by Einstein as early as 1909. His “heuristic viewpoint” was accepted only with great reluctance by physicists like Lorentz and Planck in the years immediately after 1905; as late as 1918, Planck, Nernst, and others recommended Einstein's work very highly in general, but referred to the hypothesis of light quanta as having “missed the target in . . . [its] speculations.”

In addition to the photoelectric effect, other experiments contributed to the wave-particle dualistic view of light. In 1912 Max von Laue (1879–1950), using the atomic structure of a crystal as a diffraction grating, obtained the 1st observed interference phenomena for X rays. While this also opened up a new field, solid-state physics, its immediate effect was to suggest a wave aspect for X rays, previously considered as particle streams by many. In 1922 Arthur H. Compton (b. 1892) discovered the effect named for him. Inexplicable on the wave theory of light, the scattering of photons by electrons in a way requiring the assignment of mass to light gave additional support to the particle aspect of light. In no other way could physicists explain the difference in frequency between incident and scattered X rays on the 2 sides of a thin material layer. Combination of Laue's and Compton's experiments with X rays produced the same poignant paradox as combination of Fresnel's and Einstein's theories of light, viz., a wave-particle duality.

MECHANICS

The universality of Einstein's thought is suggested by his development of rela-

tivity theory in addition to his invaluable contributions to quantum theory. The special theory of relativity, published in 1905, was conceived as a basic theoretical structure for a study "On the Electrodynamics of Moving Bodies." This article postulated (1) that physical laws are the same in all inertial systems and (2) that the velocity of light in an inertial system is independent of the motion of its source. The applicability of these assumptions to the predicament posed by the Michelson-Morley experiments (see D. C. Miller's proposals) was obvious (p. 918 above).

The **Fitzgerald hypothesis**, suggested in 1892, assumed the velocity of the earth relative to the ether to be unmeasurable in principle, for it postulated a contraction of all bodies in the direction of their motions in the ether. The contraction occurred in the ratio of $\sqrt{(1-v^2/c^2)}:1$. In 1895 Lorentz added transformation equations to the Fitzgerald contraction. The transformation regarded time as measurable differently in systems moving with respect to each other; the equations gave length and time measures from 1 system to another. While equivalent to special relativity theory as a method, the Fitzgerald-Lorentz interpretation tended to leave the ether theory in disrepute. If the ether were inconceivable in physical terms and unobservable in principle, it seemed to be a superfluous hypothesis.

Einstein's special relativity theory was conceived as a physical application of part of Ernst Mach's philosophy of science. For Mach scientific theory required both economy and generality of explanation. With this in mind, rather than the Michelson-Morley experiments, Einstein conceived space without ether and in which the speed of light was a constant. The result was to eliminate the ether on grounds of methodological economy.

While special relativity related only to uniform, or inertial, motion, Einstein's **general theory of relativity**, 1915, dealt with accelerated motion as well. In the spirit of Mach's philosophy, general relativity made space-time and matter inter-related phenomena, rather than allowing space-time to retain a quasi-absolute status, whereby it would remain independent of contained matter. With non-

inertial frames of reference, Einstein was able to show the gravitation of inertial frames (the Newtonian world) to be characteristics of the reference frame alone. Since gravitational acceleration is the same for all masses, a reference frame with such acceleration will show no gravitational effects from an internal viewpoint. Experimentally, gravitational mass and inertial mass can be shown to be equivalent. Einstein considered this to indicate a theoretical equivalence of gravity and inertia. The purpose of general relativity is to provide a field theory of gravitation which will satisfy the idea of equivalence of all reference frames. With space-time itself as the field, the theory defines such characteristics as mass in terms of the geometrical character of space-time. Likewise, the equivalence of energy and mass became apparent through general relativity theory, which was responsible for the famous equation $E = mc^2$. This gives an increasing mass as acceleration occurs and does not admit the oft-heard characterization of Newtonian gravitation as a limited case of general relativity. Also, the Euclidean geometry of space in the Newtonian world disappears in order to retain the general principle of relativity with regard to the velocity of light. Non-uniform gravitational fields, like the sun's, are described by curved, non-Euclidean space. Here the properties of space are determined by the presence and characteristics of matter.

CONSTRUCTION OF MATTER

The construction of matter as viewed theoretically derives essentially from 20th-century thinking, developing out of experimental work with subatomic particles and out of the rapidly expanding theory of quanta. J. J. Thomson's discovery of the electron (p. 923, above) was soon followed by W. Kaufmann's experimental discovery, 1901, of variability in the electron's mass, the mass increasing rapidly as its speed approached that of light. Only after the appearance of the relativity theory was this observation correctly explained. Various models of the atom preceded the important Bohr model of 1913. Thom-

son's model, 1904, spoke of a sphere of positive electrification containing discrete corpuscles of negative electricity, adding that atomic properties depended on the number and distribution of electrons. The 1st really useful atomic model, viz., one which accounted for a sufficiently large number of data, was that of Ernest Rutherford (1871-1937), who based his model, 1911, upon extensive work with radioactive particles. The scattering of alpha particles by thin metal foils indicated a concentrated nucleus but a vastly less dense region for the electron population. Rutherford's planetary electrons—the electrons around the nucleus were conceived like planets around the sun—directly contradicted Thomson's model. While Thomson had made a useful determination of charge (e) and mass (m) for the electron, it was the method, 1913, developed by R. A. Millikan which gave the most accuracy. The method hinged on a change in velocity of an oil droplet as it captured ions during its rise and fall between 2 horizontal plates. He showed that units of ionic charge are fixed and always equal, not just statistical means. The completion of pre-quantum atomic theory came with the determination of atomic numbers, indicating the number of positive electric units in the nuclei of atoms. Working in his newly developed science of X-ray spectroscopy, H. G. J. Moseley (1884-1915) found, 1913, that the frequency of a given line in the spectra of atoms successive by weight varied as $(N-b)^2$; b is a constant and N is an integer changing by unity in the succession of elements. N was the atomic number and allowed determination of the number of elements possible between any 2 of known atomic number. Elemental properties thus became fixed by atomic number.

The introduction of quantum notions into the theoretical picture of atomic structure occurred with Niels Bohr's (1885-1962) reconsideration of the Rutherford model. Rutherford had been able to produce no constant value for the length of an electron from the nucleus. Bohr's addition of Planck's constant h gave the required constant. The most con-

vincing evidence for a quantized atomic model came when Bohr turned his attention to the classification of spectral lines in 1913. Immediately Bolmer's formula struck a harmonic note in his thoughts. Subsequent computation produced Rydberg's formula and the Rydberg spectroscopic constant through use of the quantum constant h . Assuming a nucleus surrounded by normally stable electron orbits, Bohr "explained" the failure of the atom to collapse from constant dissipation of energy by the orbiting electrons; energy could be emitted only in passage of an electron from 1 privileged orbit (in terms of h) to another. This anticlassical conception of the atom, 1913, was rapidly accepted as a result of support from Einstein, Jeans, and Campbell, and because of directly confirming experiments by J. Franck and G. Hertz, 1914, on radiation in the transition of electrons from excited to stable energy levels. The extremely fertile views of Bohr provided adequate ground for both speculative and experimental development over the next decade.

Bohr's model was easily conceivable by the mind, which gave it both appeal and severe limitations. An initial modification was the transition from circular orbits to elliptical electron orbits, suggested by Arnold Sommerfeld (1868-1951). In addition, Bohr calculated the effect of the "perihelion" motion of the electron (analogous to the advance of Mercury's perihelion), according to general relativity theory, and was thus able on purely theoretical bases to explain adequately the fine structure of spectral lines. 1915. Bohr's consciousness of an apparently ineluctable contradiction between classical and quantum notions brought him to the statement, 1918, of the principle of correspondence. Considering the case where the frequency ν approaches zero, that is, where the energies approach a virtual continuum, Bohr noted that methodologically the classical frequency and the quantum frequency approach identity. This result occurs with very high quantum numbers. Theoretically, however, Bohr appeared to find both quantum and classical theories to be "caricatures," each representing only an extreme region of

phenomena. The correspondence principle formed a link between these extremes.

The isolation of Bohr's model from the issue raised by Einstein of wave vs. particle assured, hindsight shows, the downfall of that model. In 1924 Louis Victor de Broglie (b. 1892) set forth in his doctoral dissertation an elaboration of several preceding papers in which he expanded the wave-particle duality proposed by Einstein for light into a wave-particle duality for all matter. Introducing relativistic conceptions as well, Broglie suggested the existence of phase waves (faster than light), many of which composed a wave moving with exactly the speed of the particle concerned, e.g., an electron. He observed the mathematical equivalence of the undulatory principle of least time and the particulate principle of least action. His theory gave a simple, striking vision of the basis for Bohr's permissible orbits. But only with the experimental proof provided inadvertently by Davisson and Germer, 1925, in the Bell Telephone Laboratories was Broglie's new wave mechanics given belief. It was shown, to the initial surprise of the experimenters, that electrons (presumably particles par excellence) exhibited diffraction patterns (presumably evidence par excellence for waves). Almost simultaneously, other research led to an explosion of theory development in the mid-20's of this century. In 1925 Wolfgang Pauli (b. 1900) enunciated his exclusion principle. Quite simply, it said that no 2 electrons can have the same set of 4 quantum numbers. In the model of the atom the exclusion principle assigned the planetary electrons to their proper positions on a more rational basis than Bohr's previous *ad hoc* arrangement. At the same time, 1925, G. E. Uhlenbeck and S. Goudsmit provided Pauli with a new quantity needed to complete the basis of his exclusion principle. They proposed for the electron a 4th quantum number, realized on the basis of electron spin, introducing an angular momentum and magnetic moment. Spin of the electron accounted for anomalies of the Zeeman effect as well as the fine structure of optical and Röntgen spectra.

Still struggling with the inadequacies of

the continually revised Bohr atom, Werner Heisenberg (b. 1901) sought for the 1st time to obviate the use of classical mechanics as a preliminary to the use of quantum theory. Starting with nothing more than direct observation, and ignoring classically based formulas for co-ordinates and velocities of electrons as functions of time, Heisenberg recreated the calculus of matrices as a foundation for an independent quantum mechanics, 1925. In this system, multiplication of the quantum values p and q is noncommutative, to wit, $p \times q \neq q \times p$. The matrix mechanics of Heisenberg, in collaboration with Born and Jordan, was within a year converted from its initial unwieldy form to a quantum algebra based on the mathematical formalism of classical Hamiltonian mechanics. This was done by P. A. M. Dirac (b. 1902), who made use of the classical Poisson bracket expression to

obtain $pq - qp = \frac{ih}{2\pi} [p, q]$ On the basis of this mathematical reasoning, Dirac brought into quantum mechanics all of classical mechanics amenable to Poisson brackets rather than derivatives. By making the basic equation a postulate of the theory, he integrated Bohr's correspondence principle into the heart of the new mechanics, for the new postulate correlated quantum mechanical variables with their classical prototypes.

Before 1926 Broglie and others had not extended the theory of waves in quantum mechanics to the point of introducing a medium. In this year Erwin Schrödinger (1887-1961) gave the initial impetus to what became wave mechanics. His psi function related to the motion of a point in many-dimensional space (equivalent to highly complex motions in space of 3 dimensions). It gave a picture of the atom as a system of vibrations. As in acoustics, Schrödinger reasoned, so in a quantum energy transition, the change in frequency can be considered as a "beat" phenomenon. Rather than a jumping of electrons in the atom, he posited a change in vibrational mode, a process continuous in space and time and characteristic of waves. Thinking in terms of Hamilton's optical-mechanical analogy, Schrödinger

made use of the already developed notion of wave packets to link particle and wave mechanics. Yet there still remained a basic philosophical problem in 1926. If the methodology seemed acceptable, the epistemology was a paradox. What did the equations signify experientially? Schrodinger attacked Bohr's view of discontinuity and quantum jumps. It was Heisenberg who saw the analogue in the progress of relativity theory. Just as Einstein's new views of space and time formed a conceptual matrix for the Lorentz transformations, Heisenberg looked for a way to fit nature to the situations described by quantum mechanics. His result was the uncertainty relation $\Delta p \Delta q \sim h/2\pi$. That is, as p becomes more definite, q becomes less precise. Thus, in measurements on the order of magnitude of the quantum constant, when position is well determined, momentum is indeterminate, and vice versa. More than any other aspect of quantum mechanics the uncertainty principle has excited scientists, philosophers, and laymen in discussions of causality, free will, determinism, and other similar topics. Finally, in a magnificent attempt at unification, Dirac, followed by Jordan, brought relativity theory into the new quantum mechanics, 1929. For the 1st time, electron spin became intrinsically involved in the equations. The symmetry introduced by relativistic mechanics led to other problems, however. It predicted the existence of particles similar to electrons but with negative mass. This strange result appeared to be a hole in the theory until 1931, when Carl Anderson actually observed these so-called "holes in matter," now referred to as **positrons**. Yet the synthesis of relativity and the quantum, as Broglie observed, 1937, still needed refinement, for the new theoretical predictions for the behavior of the photon did not accord with experiment.

MAGNETISM

The further advance of the physicist's view of the structure of matter is best pursued by review of a separate, though

closely related, tradition: the experimental discovery and observation of radioactivity and elementary particles. But before following the experimental extension of the quantum picture of matter, the remarkable advances permitted in the understanding of magnetism on the basis of quantum theory should be outlined.

In the modern (20th-cent.) study of magnetism the preliminary developments grew out of the late 19th cent. theory of electrons. In 1901-3 W. Voigt and J. J. Thomson restated earlier conceptions of paramagnetism and diamagnetism in terms of electrons, the attempt was made to explain both forms as induced states following collision by spinning electrons. The explanation failed. Only with Paul Langevin's explanation of 1905 was it generally accepted that the magnetic theory of Ampère and Weber could be reformulated through electron theory. Regarding diamagnetism as the immediate and sole effect when 1st applying an external magnetic field, Langevin found that diamagnetism is a general atomic property based on the absence of magnetic moment. **Paramagnetism**, by contrast, appeared as an induced state masking the natural diamagnetism and caused by molecular collisions. Pierre Weiss extended Langevin's work by explaining **ferromagnetism**, 1907. Weiss considered the internal magnetic field in molecular aggregates, using the mutual effect of molecules on each other to account for ferromagnetism and its disappearance above a critical temperature. The explanations of Langevin and Weiss, Bohr wrote in 1911, were derived from failure to apply classical statistics completely; this meant that assumptions of a quantum nature had been made unwittingly.

The development of the Bohr atom, 1913, led physicists to suggest the existence of a distinctive **magnetic moment**, resulting from the quantization of electron orbits. This elementary magnetic moment came to be known as the **Bohr magneton**. In 1918 Bauer and Picard experimentally verified this elementary moment as equal to $he/4\pi mc$ in paramagnetic gases. Sommerfeld's above-mentioned work of 1915 involved the limiting of orientations of

the magnetic moments with respect to the field. Only parallel, antiparallel, or perpendicular orientations are possible. Magnetic moment associated with Uhlenbeck's and Goudsmit's 1925 discovery of electron spin explained fine spectral lines. Weiss's proposed internal magnetic field was explained in 1928 by Heisenberg on the basis of electron exchanges in the atom and between atoms. Ferromagnetism, he said, results from the stable parallelism of a number of electron spins, as the electrons exchange positions between atoms. Further understanding of ferromagnetism came from Felix Bloch's postulating a "Bloch wall," 1932, between neighboring domains magnetized in different directions. This wall constituted a transition layer where the magnetic moments were arranged in spiral fashion. In 1931 Bloch suggested spin waves. These arose at a certain point when rising temperature caused the directional change of an atomic magnetic moment in a ferromagnetic substance. The originally (at absolute zero) parallel moments would be disturbed by the heat input, and the reorientation of 1 atomic moment would affect nearby atoms, the continuing effect being known as a spin wave.

The attribution of a magnetic moment to the atomic nucleus as well as to the electron 1st occurred with Pauli, 1923, but it was Enrico Fermi (1901-54) who clearly developed and quantitatively defined nuclear magnetic moment, 1930. This moment turned out to be on the order of $1/1,000$ the value of the Bohr magneton. The possibility of correctly and accurately measuring nuclear magnetic moment arrived with the work of I. I. Rabi, 1934. His method involved quantitative determination of the basic cause of magnetic moment, precession, via the effect had by an electromagnetic wave in resonance.

RADIOACTIVITY AND ELEMENTARY PARTICLES

While the rapid development of magnetic theory was a notable result of an effective, matured quantum mechanics,

the applicability of the basic laws of the quantum was constantly questioned and stretched by the experimental discoveries of elementary particles. In fact, the very inception of a quantum theory of atomic structure grew out of such discoveries.

The earliest modern curiosity about components of the atom arose with work on radioactivity. From the Crookes tube, Wilhelm Konrad Rontgen (1845-1923) observed a new emission in 1895. This new ray, which he called X ray, caused fluorescence of a paper screen washed with barium-platinum-cyanide, and the radiation could penetrate wood, flesh, aluminum, and other materials. However, refraction and other properties of normal rays did not seem to belong to Rontgen's rays. It was known in the Cavendish laboratory at Cambridge that photographic plates were affected by Crookes tubes. The reaction was simply to keep Crookes tubes away from storage areas for photographic plates! The 1st recognition of the importance of such exposure of sealed photographic plates was that of Henri Becquerel (1852-1909), who observed the effects of uranium salts on these plates, 1896. He initially assumed exposure of the uranium to sunlight to be necessary, but soon found that similar results occurred after months of nonexposure. This radiation, like X rays, had the property of discharging electrified bodies by making conductors of insulators. Excited by Becquerel's work, Marie Curie and her husband Pierre began work on radioactive elements. Thorium was found to behave like uranium. A new element, polonium, was discovered, 1898. Since both bismuth and barium obtained from pitchblende ore exhibited radioactivity, it appeared that another component of the ore must explain the radioactive properties. In 1898 the separation of a radium salt, and presumably therefore a new element, was announced. Only 4 more years of work enabled the Curies to isolate radium in sufficient amount and pure enough to establish unequivocally, 1902, its independent existence and attributes. These 4 years resulted in the collection of one decigram of pure radium chloride.

The continuing emission of energy in radioactivity, especially by radium, raised the problem of conservation of energy. How could this emission continue, apparently undiminished, with no observable change in the radium? It was suggested by Elster and Geitel, 1898, and developed by Rutherford and Soddy on experimental bases, 1902-3, that a radioactive atom is in the process of changing from an unstable to a stable condition. As early as 1900 the rays emitted by radium had been recognized as 3 in type: alpha, beta, and gamma rays, in order of penetrability. In 1903 the disintegration hypothesis of Rutherford and Soddy was given experimental support by Ramsay and Soddy, who identified helium spectroscopically as the gaseous emanation from radium bromide. By 1908 Rutherford could recount the recent discoveries in support of the disintegration theory in terms of an established list of parentage from uranium down to radium and on to a variety of subsequent products including lead. The particle experiments of 1908-9 by Rutherford, Geiger, Marsden, and Røds liberated extensive data. An electric method of counting alpha particles was devised and used. Alpha particles were proven to be positively charged helium atoms. The scattering of alpha particles by atoms of a thin plate was observed and quantitatively determined. The appearance of deflections at angles greater than 90° was the basis of Rutherford's important atomic model of 1911. Within a year C. T. R. Wilson had devised the cloud chamber, wherein the deflections of alpha particles by single atoms, described by Rutherford, could be photographed and observed.

With the investigation of radioactive breakdown of elements, there emerged the suggestion of atoms chemically identical but physically (by atomic weight) different. By 1913 much experimental data existed supporting this result for radioactive elements. In that year J. J. Thomson, using his "positive-ray analysis" for finding values of m/e , found that neon in his discharge tube produced results for atomic weight 20 and atomic weight 22 also. Both atoms were neon, differing only

in atomic weight. The displacement laws indicating the position in the periodic table of atoms derived from radioactive decay were drawn up by A. S. Russell, K. Fajans, and F. Soddy in 1913. The name *isotope* was given by Soddy to both radioactive and nonradioactive variants of an atom. F. W. Aston (1877-1945) contributed extensively to isotope research. He confirmed the 1913 work of Thomson, assessed the masses of various isotopes with respect to oxygen (the ratios being in whole numbers), and suggested possible methods for separating isotopes, 1919. In 1913 Rutherford had already laid down the theoretical distinction explaining isotopes when he pointed to the positive charge of the nucleus as the fundamental constant determining chemical properties; change in mass alone would have no chemical effect.

In 1919 Rutherford established the *proton*. Explaining the collision of an alpha particle with hydrogen atoms, he showed by measuring deflections in magnetic and electric fields that a hydrogen nucleus of unit positive charge resulted from the collisions. This charged hydrogen nucleus was soon designated by the term *proton*. Subsequently he directed alpha particles at nitrogen. In 1920 he proved that an occasional particle will actually collide with a nitrogen nucleus and alter the nucleus from charge 7 to charge 8 and from mass 14 to mass 17, i.e., from nitrogen to an isotope of oxygen. Transmutation of matter was thus realized. In 1921 Rutherford and Chadwick noted similar transformations for 5 other elements, the beginning of a continually extended list.

The climactic era of quantum mechanics (c. 1925-28) issued in the unexpected, initially unwanted prediction of a new particle by Dirac's theory of the electron, 1928, which required the existence of a positive electron and an antiproton. The positron was discovered in 1932, but it was not until 1955 that the antiproton was observed with certainty. While antiparticles were disconcerting, the discovery of newer types of particles left the neat world of the proton and electron (and perhaps their antiparticles)

aghast. As early as 1920 Rutherford had postulated the neutron. Bothe and Becker, 1930, discovered the emission by light nuclei of extremely penetrating rays, when bombarded with alpha particles. Attempts to explain the radiation as electromagnetic failed. Using new detecting techniques, Chadwick, 1932, identified the rays of Bothe and Becker as neutral particles, i.e., **neutrons**. The antineutron was not observed until 1956.

From 1930 on the world of elementary particles rapidly came to resemble a zoo—or even a haunted house—as many particles were postulated as necessary and discovered only years later. In order to save the law of conservation of energy, Wolfgang Pauli, 1930, invented the **neutrino**. Maintaining a constant speed, that of light, this particle was without mass or charge. Posited to account for the apparent imbalance of energy in beta radiation, the neutrino was claimed to possess whatever energy the observed beta particles lacked to add up to the loss of energy by the emitting nucleus. The neutrino remained an article of faith with physicists until its experimental detection in 1956. Pauli's idea of an origin within the nucleus was soon discarded by Fermi, 1934. Since the establishment of neutrons, 1932, it seemed unreasonable to suppose electrons within the nucleus. So also for neutrinos, said Fermi. Instead, the electron (beta particle) and its accompanying neutrino are created at the moment of emission; simultaneously a nuclear neutron becomes a proton. Here was the 1st successful theory of creation and destruction of basic matter.

In 1935 Hideki Yukawa predicted the existence of the pi meson, or **pion**. Just as the recent quantum theory of electric and magnetic force had designated photons as the carriers of force, so Yukawa considered a particle exchange as the cause of nuclear force holding protons and neutrons together. Such a force had to be strong enough to overcome the electrical repulsion of protons in the nucleus, but its strength must act only over very short distances, about 10^{-12} cm., the size of the nucleus. The existence of the pion was justified in terms of the uncertainty

principle, which defined both the energy limit and lifetime limit of the pion. The occurrence of the particle was explained by collision of 2 highly energetic protons, one of which converted momentarily into a neutron and a pion. The continuing process in protons accounted for the stability of the atomic nucleus. Over a decade passed before this useful particle was actually observed, 1947. In 1936 a particle thought to be the pion was observed in cosmic radiation. However, this newly observed particle turned out to be the **muon**, which is 200 times as massive as the electron, but otherwise essentially identical to it.

From 1934 on, a number of physicists, pre eminently Fermi, developed the discovery by I. Curie and F. Joliot, 1934, that highly energetic alpha particles will bring about a continuing emission of positrons when nonradioactive elements are bombarded. Fermi turned to the production of neutrons in place of alpha particles and thereby increased greatly the potential for artificial nuclear transmutations, since the neutron is not repulsed by the positive nucleus. This new tool, the bombarding neutron, became the critical tool in producing continuous nuclear fission. By 1939 it was recognized that suitable materials, such as uranium 235 and plutonium, produced much kinetic energy and beta radiation, with the simultaneous release of neutrons providing a basis for further fission. Technical difficulties were surmounted to allow Fermi and his collaborators to produce a "critical" atomic pile in late 1942.

In 1941 the divergence difficulties of quantum field theory prompted Wheeler and Feynman to propose the notion of action-at-a-distance as an alternative to that of the field. In terms of particle physics this meant direct particle interaction with no independent field having its own energy and momentum. The approach of Wheeler and Feynman did aid in eliminating divergences (infinite terms), and it also introduced the peculiar notion of advanced potentials (1st suggested by Schwarzschild in 1903). In fact, the 2 men argued that field and action-at-a-distance interpretations are ul-

timately interchangeable. The union, rather than conflict, of Newtonian mechanics and relativistic, four-dimensional space was the basic direction proposed. The means was a complementary view of particle and field.

From 1947 to 1954 the list of known particles expanded from 14 to 30. In the same time period the available energy in a particle accelerator was increased 30 times. The 16 new particles belonged to 4 families, kaons, lambdas, sigmas, and Xis. Though unpredicted and unexpected, they soon came to be considered the last strongly interacting long-lived particles to be available for discovery. In 1953, Gell-Mann and Nishijima (independently) developed a conservation law in terms of values assigned *ad hoc* to the types of particle. The law predicts whether and what sort of particle can be expected in a strong interaction process. The 4 new types have been found always to be produced in numbers of 2 or more.

In 1956 Tsung Dao Lee and Chen Ning Yang suggested that the previously assumed parity principle might profitably be abandoned in order to solve certain

problems. That this spatial symmetry (or parity) could be violated in *weak* interactions was verified in the same year, when it was shown experimentally by Chien Shung Wu that nature shows a definite preference for emission of beta rays from cobalt 60 in a particular direction. This suggested, theoretically, that the equations for interaction of quantized fields need not be symmetrical with respect to parity and to charge separately. A simpler mathematical expression could be introduced, involving only a combined symmetry in charge and parity. In the mid-1960's workers at the Brookhaven National Laboratory apparently established violation of symmetry (charge-conjugation symmetry) in interactions other than weak ones, specifically in the decay of neutral eta mesons, about 7.2% of the time. However, repetition of the Brookhaven experiments by C.E.R.N. (Conseil Européen pour la Recherche Nucléaire) workers with almost 10 times as many examples failed to confirm the proposal of violation in some strong interactions.

Chemistry

17th and 18th Cents.

BOYLE. The 2 kinds of chemical change most interesting to the alchemists of medieval times were combustion and the calcination of metals. Both involved heating, and both were actually the same sort of reaction. The recognition of the identical nature of these 2 processes marked the initial stage of modern chemistry. That fire was an especially potent agent in chemical change was a truism for the alchemist; witness the stereotype of a practitioner huddled over his retort. In the late 17th cent. Robert Boyle (1627-91) experimented, ingeniously with heated compositions. In an evacuated jar he heated tin; after cooling it he opened the jar to weigh the tin, finding that its weight had increased. Because he made the measurement after opening the con-

tainer, Boyle failed to perceive the equal importance of air in calcination and in combustion. He had noted the failure of heated sulphur to burn in an evacuated jar. But the calcination of tin he explained as passage of igneous corpuscles through the container into the metal, thus adding to the weight. Despite such errors Boyle is remembered as a founder of modern chemistry. He emphasized its theoretical study for no ulterior, i.e., alchemical or iatrochemical, reason; he rigorized experimental method; he gave a clear definition of an element.

STAHL. The problem of "fiery corpuscles" as discussed by Boyle was made elementary in the phlogiston theory of George Stahl (1660-1734), who explained changes accompanied by heat in terms of "the matter and principle of fire." The phlogiston theory presumed to account

for combustion and calcination. However, when considerations of weight change were added to this essentially qualitative theory, it was found inadequate—unless phlogiston should sometimes possess negative weight! The centrality of the quantitative question in phlogiston theory led chemical theory in a more mechanical and materialistic direction. The phlogiston theory was never conceived to deal primarily with the question addressed by Lavoisier's oxygen theory—the question of weight changes.

LAVOISIER. Antoine Laurent Lavoisier (1743–91) led a life of varied interests, many of which exhibited his economical approach, as if using a balance sheet to organize the answer to any question. This balance-sheet outlook dominated his chemical work. Along the way, his careful method led him safely past the pitfall of Boyle. Lavoisier weighed his heated tin both before and after opening the exhausted container. He soon had the quantitative aspects of combustion and calcination completely in hand. The theoretical explanation occurred to him only after the suggestion from Priestley that the product of heating a calx (oxide) was dephlogisticated air. Ignoring phlogiston, Lavoisier saw that "purified air" (oxygen) was the product. Subsequent quantitative experiment, including a correct interpretation of Cavendish's combustion of "inflammable air" (hydrogen) to get water, led to the formulation of Lavoisier's oxygen theory of chemical combination.

19th Cent.

DALTON. After Lavoisier, oxidation as such ceased to be the most attractive topic of chemical discussion. Lavoisier stopped short at classification and refused to consider an atomic theory in chemistry, for he saw such a theory as metaphysics. The primary issue leading to atomic theory after Lavoisier was the mechanism of reaction. Whether the structure of matter was continuous or not was argued by Berthollet (continuum) and Proust (discontinuity). J. L. Proust (1754–1826) completely discredited his opponent and set forth the law of fixed proportions in

1799. In the same vein, but in a somewhat forbidding and speculatively mathematical way, J. B. Richter (1762–1807), laid down the law of reciprocal proportions in 1791. The 3rd such law, that of multiple proportions, was given by John Dalton (1766–1844), who realized the full theoretical import of these quantitative laws, each of which showed a preservation of integral amounts of the substances involved. Dalton's atomic theory appears in *A New System of Chemical Philosophy*, 1808. Making the philosophical jump needed to pass beyond the macroscopic laws on proportions, he hypothesized a microscopic world of atoms. For Dalton every atom of a single element was alike; the differences between elements were discontinuous. Like the ancient atomists, he retained a simple mechanical view, implicitly involving himself in the reductionist's difficulty of explaining qualities of the compound not possessed by its constituents.

Dalton's emphasis on simplicity, both mechanically and quantitatively, led to a persistent confusion for another half-century. His atomic theory was based directly on relative weights, whence he considered a compound like water, seen simply as HO, to be made of hydrogen having a weight of 1 and oxygen 8. The principle of economy could hardly have been more misleading.

In 1808 J. L. Gay-Lussac suggested on sound experimental bases integral volume relationships in gas reactions. Based on the equal expansion of gases with temperature increase, his hypothesis should have led chemists to the view that equal volumes of gases have equal numbers of reactive particles. Gay-Lussac noted the ease with which Daltonian atomism fitted into his law, yet Dalton never agreed. Dalton chose to assess the validity of the law via his assumption of monatomic particles in common gases like oxygen. Since this obviously made Gay-Lussac's statements on relative densities of gases seem paradoxical, Dalton blithely assumed Gay-Lussac wrong. Berzelius was able to use Gay-Lussac's hypothesis to define water as H_2O and ammonia as NH_3 .

AVOGADRO. Amadeo Avogadro (1776–1856) explicitly resolved the problem

in Dalton's thinking. Gay-Lussac had pointed out that 2 volumes of hydrogen and 1 of oxygen give 2 of steam. The implications of this fact and others behind the law of combining volumes were made distinct by Avogadro's hypothesis, 1811. Interested in combining volumes from the chemical rather than physical viewpoint, Avogadro conceived an equal number of molecules in equal volumes of 2 gases. Noting that this required the splitting of molecules into "half-molecules" in such combinations as hydrogen plus oxygen, he explained away Dalton's objections to Gay-Lussac. In 1814 Ampère revived Avogadro's hypothesis, but it was generally ignored for half a century until its usefulness was more obvious to chemists.

BERZELIUS. In the early development of electrochemistry, growing out of the experiments by Galvani, Volta, and Nicholson and Carlisle (p. 919, above), the use of atomic theory and Avogadro's hypothesis did not seem necessary. As early as 1803 Jöns Jakob Berzelius (1779-1848) noted that decomposed salts in electrolysis resulted in acids at the positive pole and bases at the negative. Berzelius, who introduced modern chemical symbolism in 1813, followed up extensive experiments by Humphry Davy and himself with a dualistic theory, 1812. As a synthesis this theory assumed an identity of chemical and electrical attraction. Metals were electropositive; oxygen was strongly electronegative. Chemical combination came from neutralization by oppositely charged elements, but this occurred on a nonquantitative level. A compound could retain over-all charge, so that a substance like copper sulphate exhibited characteristics considered to be electropositive. Michael Faraday (p. 921, above) brought electrochemistry to a more quantitative level. Contemporary with his collaboration (with William Whewell) on the development of a nomenclature for electrochemistry, 1833, Faraday experimented with conductivity and electrolysis. Observations such as the unsatisfactory nature of pure water as conductor resulted. More significantly, he recognized a relationship between amount of electrical current and amount of substance decom-

posed. The ratios of quantities gave rise to electrochemical equivalents. The potential assistance of this work for solving atomic-weight values was postponed by Berzelius' refusal to accept Faraday's electrochemical laws.

DEVELOPMENT OF ORGANIC CHEMISTRY. The dualistic theory of Berzelius eventually foundered on the growing mass of data from organic chemistry. Rather like animal electricity, animal, or organic, chemistry was considered in the late 18th cent. to be radically different from its mineral, or inorganic, relative. The basically German school of *Naturphilosophie* supported this distinction. The vitalists in biology and medicine also maintained the essential differentiation of living from nonliving matter. Not until 1828 was a crucial blow given to the vitalist view of organic compounds. At this time Friedrich Wöhler (1800-1882) synthesized urea, an animal product, from inorganic substances. The synthesis of organic from inorganic compounds henceforth provided the keystone of antivitalist literature.

The wide variety of organic compounds made up of a small number of chemical elements posed special problems for organic chemists. Gay-Lussac established, 1815, the concept of the radical, "a body which, though compound, acts the part of a simple substance in its combinations with hydrogen and metals." At the same time Michel Eugène Chevreul (1786-1889) studied the composition of fats with the help of the radical concept. He concluded, 1823, that fats were compounds formally analogous to inorganic salts; fats were compounded from organic acids and glycerol. Organic and inorganic substances reacted according to the same laws. The discovery by Wöhler and Liebig, 1832, of the benzoyl radical seemed to confirm the hopes of the organic chemist for the radical concept. By 1830 the significance of structure, introduced implicitly by the radical concept, became clear when Berzelius noted the identity upon analysis of tartaric and racemic acids. That different properties could result from structural variations with the same chemical atoms he indicated by the term "isomerism."

In 1837 Justus von Liebig (1803-73) and J. B. A. Dumas (1800-1884) claimed the radical concept as the final key to organic chemistry. But the simple nature hereby assumed for the organic radical, as a direct analogue of the inorganic element, was soon discredited. In 1834 Dumas reported the substitution of hydrogen by chlorine in the process of chlorinating ethyl alcohol. Auguste Laurent (1808-53) carried this line of questioning far enough to say that chlorine "takes the place of" hydrogen in such reactions; for example, chlorination of naphthalene gave compounds remarkably similar to the original naphthalene. Dumas rejected this extension of the empirical evidence. Forced by later evidence to revise, Dumas went even further and suggested chlorine substitution for the carbon atom as well as the hydrogen, thus prodding Liebig into public ridicule, 1840, of Dumas' overextension of the "type" theory of substitution. Laurent's theory, experimentally based, made untenable Berzelius' attempt to apply dualistic theory to organic chemistry. It also aroused Liebig's ire, since the substitution theory made the simple radical concept unacceptable. The theory of original and derived nuclei (the type theory), begun by Laurent, was a focus of chemical controversy for over a decade. A notable aspect of Laurent's version was the use of a geometrical model to explain substitution.

MOLECULAR STRUCTURE. At mid-century a primary interest was locating the position of radicals in molecules. Various type theories were introduced by Charles A. Wurtz (1817-84), Alexander W. Williamson (1824-1904), and Charles F. Gerhardt (1816-56). These new types had predictive value for indicating substitution products; the older type theory had been only a classifying tool. In 1852 Edward Frankland (1825-99) was able to add the concept of valence to clarify the organic combining capacities of various metals and, by extension, of all atoms.

As early as 1848 Louis Pasteur (1822-95) had given classic demonstration of the importance of structure for understanding chemical compounds on the

level of microscope observation. The only difference between levorotatory and dextrorotatory optical activity of salts of tartaric acid was in their crystalline structure. One was the mirror image of the other. J. H. van't Hoff (1852-1911) and J. A. Le Bel (1847-1930) independently explained such behavior, 1874, by noting possibilities for isomerism with tetravalent carbon, having 4 equally spaced (3-dimensionally) positions for attachment. If 4 different radicals were shifted among these 4 positions on carbon, e.g., in lactic acid, 2 different, mirror-image arrangements existed. This was the only difference between the 2 optically active forms of $\text{CH}_3\text{CH}(\text{OH})\text{CO}_2\text{H}$. To Friedrich August Kekulé (1829-96) belongs the credit for making known the ability of carbon atoms to form chains. In 1858, after working on the variety of formulae possible by mixing different types, the idea of multiple carbon chains occurred to him. He thought of the concept when he generalized tetravalence of carbon to include combination between 2 carbons, so that each was left with only 3 positions for attachment of other atoms or radicals. The open-chain, or aliphatic, structure as well as the ring, or aromatic, structure, 1865, were conceived by Kekulé in a modified, 2-dimensional way. Kekulé's "flat" projections were 1st given stereometric interpretation by van't Hoff and Le Bel's conception of the carbon atom's distribution of its 4 bonds in the directions of the corners of a regular tetrahedron, 1874.

The organic synthesis represented by Kekulé, van't Hoff, and Le Bel led to a flowering of analytic work in the field. A. G. Brown (1838-1922) noted the double bond for ethylene, 1864. Emil Erlenmeyer (1825-1909) conceived the triple bond for acetylene, 1862. Tautomerism, observed in acetoacetic ester as early as 1863, was explained, 1876, by Alexander M. Butlerov (1828-86). Only gradually did the equilibrium between *keto* and *enol* forms of such compounds become apparent. Adolf Baeyer (1835-1917) developed the strain theory, 1885, to explain stability in ring compounds by the distortion of their bonds from the

normal tetrahedral arrangement. Victor Meyer's (1848-97) theory of steric hindrance, 1894, appealed to structural considerations to explain the obstruction of substitutions on any carbon atom near another holding large groups. Emil Fischer (1852-1919) was able to make elegant use of stereochemical techniques in characterizing isomeric sugars, 1891.

SYSTEMATIZATION OF INORGANIC CHEMISTRY. Roughly contemporary with the structural organization of organic chemistry occurred the systematization of inorganic chemistry. Basic to this was Stanislaw Cannizzaro's (1826-1910) revival and promulgation of Avogadro's hypothesis via the "Sunto di un Corso di Filosofia Chimica," 1858. Referring atomic weights to the weight of a half-molecule of hydrogen as unity, Cannizzaro gave correct molecular weights for many compounds. With correct molecular weights as the index for establishing elemental interrelationships, progress rapidly appeared. Earlier William Prout (1785-1850) suggested, 1815-16, that atomic weights might be systematized as integral multiples of hydrogen as unity. Johann W. Döbereiner (1780-1849) noticed, 1829, a natural grouping of elements in triads, such as chlorine, bromine, and iodine.

Following the reintroduction of Avogadro's hypothesis, A. E. B. du Chancourtois (1819-86) arranged, 1862-63, the elements in a spiral in terms of atomic weight. John A. R. Newlands (1837-98) also developed the notion of periodic repetition in his law of octaves, 1865, placing all elements in a chart with 8 vertical rows. The most important systems were those of Julius Lothar Meyer (1830-95) and Dmitri Ivanovitch Mendeleev (1834-1907). Both used the atomic weights made possible by Avogadro's hypothesis in order to construct a list of elements in order of increasing atomic weight. Meyer, 1870, emphasized periodicity of physical properties while Mendeleev, 1869, was most struck by the periodicity of chemical properties. Mendeleev stressed the predictive value of the periodic table. Noting 3 empty places on the chart, he predicted the characteris-

tics of the elements which would be found to fit in these places. The subsequent discoveries of gallium, 1874, scandium, 1879, and germanium, 1885, confirmed his speculations. Thereafter the periodic table was widely accepted.

PHYSICAL CHEMISTRY. Physical chemistry in the 19th cent. developed significantly in the areas of kinetic theory, thermodynamics, and electrochemistry. C. L. Berthollet (1748-1822) 1st recognized clearly, 1803, the importance of concentration, or mass, in the extent of a reaction. Gay-Lussac reiterated the idea of mass action. In 1850 Ludwig Wilhelm (1812-64) found a determinate relationship of rate of reaction and amount of reactant present. The notion of 2 simultaneous and opposite reactions, at equal rates, was pointed out by Williamson, 1850, as characteristic of chemical equilibrium. In 1862-63 Marcellin Berthelot (1827-1907) and L. Péan de St.-Gilles (1832-63) measured the affinity relations in the formation of esters, but failed to study the reverse reaction, hydrolysis, in the equilibrium. Only with Cato Maximilian Guldberg (1836-1902) and Peter Waage (1833-1900) was the law of mass action fully stated and demonstrated, 1863. Showing that equilibrium is achieved in incomplete reactions, they gave a quantitative expression of equilibrium conditions at a given temperature in terms of molecular concentration. Other conditions being equal, the "driving force" for substitution was found to be directly proportional to the product of the masses. Van't Hoff classified reactions in terms of the number of molecules participating, 1877. Svante Arrhenius made it clear that not every molecular collision resulted in reaction, 1889. With the solid basis accumulated by the last quarter of the century, kinetics became a recognized field in chemistry.

For roughly 50 years after Lavoisier, no chemical studies of heat were made. In 1840 Germain Henri Hess (1802-50) established the constancy of heat evolved in a reaction sequence, no matter the number of intermediate steps. Following the initial translations of thermodynamics from physics to chemistry, Josiah Willard

Gibbs made important studies in thermochemistry. In addition to the phase rule, already discussed, he introduced useful concepts like chemical potential.

Prior to Arrhenius, the most important study of ions was that of Johann Wilhelm Hittorf (1824-1914), who studied ion transport in solutions and observed that each ion had a characteristic rate of transport. He concluded that ions in an electrolyte do not exist in a stable, molecular form. Svante Arrhenius (1859-1927) announced the dissociation theory in 1883. Basically, he said that a dissolved electrolyte was immediately dissociated, whether or not current flowed. The theory explained electrolytic conduction, osmosis of aqueous solutions of acids, bases, and salts; and other results in physical chemical research of the period. Extending the dissociation theory, Walther Nernst (1864-1941) explained electromotive force via solution pressure of the electrodes balanced by osmotic pressure of the dissolved ions, 1889. In the same year he conceived the theory of solubility product to explain precipitation reactions.

20th Cent.

PHYSICAL CHEMISTRY. Nernst's 3rd law of thermodynamics, 1906, defined the entropy of a crystal at absolute zero as zero. The theory proved most useful in calculating chemical equilibrium from few physical constants. G. N. Lewis (1875-1916) made current the thermodynamic notion of free energy as maximum work available in a system, 1923. He and others in California have done much to extend the use of the 3rd law of thermodynamics.

In 1913 Max Bodenstein discovered the chain reaction resulting from the bombardment of hydrogen and chlorine by a photon. This along with observation, 1900, of free triphenyl methyl radicals suggested the general existence of free radicals. Spectroscopists' reports along these lines were affirmed in 1925 by Hugh Taylor, who considered free radicals to be frequent participants in chemical reactions.

Chemical kinetics received further in-

terest because of radiation studies. Jean Perrin advocated a radiation hypothesis of reaction, 1918, seeing that frequency of collision in monomolecular reactions did not determine reaction rates. Activation energy was assumed to come from radiation from the walls of the container. The hypothesis forced re-examination of reactions and brought a reassertion by F. A. Lindemann, 1922, of the collision hypothesis. Further study showed that activation energy must be concentrated in a single bond for a monomolecular reaction to take place.

Arrhenius' theory of solutions had raised more questions than it answered; it applied only to dilute solutions and was based only on aqueous solutions. Peter Debye (1884-1967) and Erich Hückel (b. 1896) improved the theory of dilute aqueous solutions by postulating an "atmosphere" of oppositely charged ions for each ion. The atmosphere was used to explain the decrease in mobility of the central ion toward an oppositely charged electrode. Reduction in mobility was made proportional to the square root of concentration. Thomas M. Lowry (1874-1936) and J. N. Brønsted (1879-1947) independently proposed, 1923, a broader acid-base theory in terms of the acceptance (by a base) or loss (by an acid) of a hydrogen ion. The transfer of hydrogen ions was the essential character of acids and bases compared to salts, which were left under the aegis of the Debye-Hückel theory. G. N. Lewis broadened acid-base theory more by considering acceptance or donation of an electron pair (rather than loss or acceptance of hydrogen ions or protons) as the characteristics of acids and bases respectively, 1938. This definition of an acid as any molecule or ion with an incomplete electron group around 1 of its atoms gave much greater generality to the acid-base theory of solutions.

Following the placement of orbital electrons through the work of Bohr, Sommerfeld, and Moseley (p. 926, above), it was possible for G. N. Lewis and Walther Kossel each to propose the electrovalent theory of chemical bonding, 1916. Since 8 outer-ring electrons were required for stability, as in the rare gases, any de-

deficiency could be filled by the transferring or sharing of electrons apropos of their number of vacancies in the outer shell. In the case of electrovalency, 2 ions are conceived as contributing to each other, as in common salts. Irving Langmuir (1881–1957) further developed Lewis' theory, introducing the term "covalent" to explain more clearly combination in non-metallic atoms as a bond in which both of a combination pair of electrons come from the same atom. 1919. Nevil V. Sidgwick (1873–1952) 1st called attention to the radical difference of the so-called covalent bond from the electrovalent, 1923. As understood by Langmuir, the covalent bond simply explained combination of incomplete electron shells. Sidgwick recognized the usefulness of what he called the co-ordinate bond to explain co-ordination compounds like H_2PtCl_6 , formed by HCl and $PtCl_4$. Alfred Werner (1866–1919) had given the 1st successful account of these formations in 1893. Sidgwick's application of covalent bonds to co-ordinate compounds gave a more suitable mechanism for their occurrence.

With the development of quantum mechanics in the 1920's, physical chemistry saw new vistas opened. Among the early users of the new physics in chemistry was Linus Pauling, who developed the resonance theory, 1931, as a means for treating a nonvisualizable state between 2 conceptual structures. Pauling contributed the concept of electronegativity for explaining partially ionic compounds and assisted in the working out of the notion of hydrogen bonding in liquids such as H_2O , HF , and CH_3CO_2H .

BIOCHEMISTRY. In the 20th cent. biochemistry's most extensive contribution has been in the area of nutrition. In 1906 Frederick Gowland Hopkins (1861–1947) made it experimentally clear that highly refined fats, proteins, carbohydrates, and minerals are insufficient as foods. He pointed out that natural foods obviously contain many other substances essential for health. In 1909 Thomas B. Osborne (1859–1929) and Lafayette B. Mendel (1872–1935) began experiments which showed the wide variety of chemical composition of pro-

teins, especially in terms of amino acids present. The dietary importance of different amino acids became evident as a result of experiments with different proteins.

Casimir Funk (b. 1884) introduced the notion of vitamins in 1912 when he found in rice polishings and in yeast a concentrated pyrimidine which cured beriberi. The original name "vitamine," coined by Funk, meant that the trace nutrients responsible for curing beriberi, scurvy, pellagra, and rickets were amines involved in vital processes. Even though later research showed some to be nonamines, the shortened form, "vitamin," came into use.

E. V. McCollum and M. Davis identified vitamin A as present in the nonglyceride part of fats, in glandular tissues, and in plant leaves, but not present in animal fatty tissues or in vegetable oils. While vitamin A was initially considered a preventive for rickets as well as for the characteristic eye soreness associated with vitamin A deficiency, E. Mellanby, 1919, found rickets in animals fed the vitamin. McCollum, 1922, introduced the term "vitamin D" to explain the prevention of rickets by cod-liver oil even after its vitamin A was destroyed.

Vitamin C, or ascorbic acid (named 1933), was 1st isolated in 1928 by Albert Szent-Györgyi from adrenal glands, orange juice, and cabbage. When Charles G. King found a crystalline substance, 1931, preventing scurvy in guinea pigs, Szent-Györgyi and J. Svirbely identified it as the compound isolated in 1928. Structural analysis and subsequent development of commercial syntheses soon made vitamin C an inexpensive product.

In 1915 McCollum introduced the water-soluble B vitamin concept. As studies progressed, the extensive complex of vitamins involved here became evident. Not until 1926 was the antiberiberi factor isolated in crystalline form. Another decade was required for analysis and commercial synthesis; R. R. Williams, who did this work, named the substance thiamin.

The isolation of vitamin B_2 in the early 1930's was due to the work of many

biochemists. Preparation of a yellow oxidation enzyme from yeasts and also from whey powder led Kuhn and Booher to the recognition of a spectroscopic similarity of yellow pigments from yeast, liver, heart muscle, spinach, and eggs. Kuhn and Karrer synthesized B_2 in 1935. In 1936 nicotinic acid was found to be a derivative of the yellow oxidation enzyme from yeasts. By 1937 the usefulness of this substance in curing pellagra was established by Conrad Elvehjem. Throughout the 1930's and 1940's further extension of the B vitamin complex was made, down to the isolation, 1948, of B_{12} , successfully

analyzed via X-ray studies, and usefully applied in the treatment of pernicious anemia.

In addition to vitamin studies, the explorations of effects of inorganic elements made clear by the end of the 1930's the need of animals for such as sodium, magnesium, zinc, cobalt, iodine, and phosphorus. While nutrition studies form only 1 field in modern biochemistry, they serve to illustrate the fruitful interaction of biological, chemical, and medical knowledge found as well in the biochemical studies of metabolism and hormones in the modern era.

Biology

DEVELOPMENT OF RESEARCH TECHNIQUES. The emergence of modern biology, especially zoology, was intimately connected with the Scientific Revolution's themes of experimental method and quantitative investigations. Following the 16th cent. return to an emphasis on direct observation (which Aristotle and Galen had always stressed), a systematic experimental method was not unnatural for biology when such a method was put forth by Bacon and Descartes. William Harvey (1578-1657) showed the advantage of careful, controlled experiment in his inductive reasoning concerning the circulation of the blood. He also made some use of quantitative reasoning, when he wondered what the body could do with such a large quantity of blood as the heart pumps per minute. 17th-cent. mechanistic views were carried to their logical conclusion by Richard Lower (1631-91), who treated the heart as nothing but a mechanical pump. Stephen Hales (1677-1761) carried the quantitative methodology to cruel perfection in his experiments on blood pressure and blood quantity in a horse (*Haemastaticks*, 1733). His earlier work, presented in *Vegetable Staticks*, 1727, provided important quantitative and functional information on plants. Along with Hales, Albrecht von Haller (1708-77)

was one of the few 18th-cent. biologists to continue the experimental tradition of the 17th cent. His distinction of irritability (contractility) from sensibility in the nervous system, 1755, provided an important basis for the flourishing of neuropsychology in the 19th cent.

SYSTEMS OF CLASSIFICATION. Most characteristic of 18th-cent. biology were philosophical discussions over the nature of life and the system of natural order. These discussions were close to the heart of Enlightenment rationalism. One of the more fruitful results of such interest was a useful system of classification. As early as Andrea Cesalpino (1519-1603) a system of plant classes by flower and fruit types had been offered, 1583. Kaspar Bauhin (1560-1621) used part of Cesalpino's scheme and suggested a clearer distinction of genus from species in plants. John Ray (1627-1705) 1st turned to a distinctly "natural" system of classification, 1686. This required that all resemblances be accounted for, rather than an artificially chosen few. Building upon his predecessors, Carl Linnaeus (1707-78) first issued his *Systema naturae* in 1735. His system was essentially that still in use today, involving a hierarchy of class, order, genus, and species. His regular form of description for the parts of plants and animals became standard.

From Linnaeus on it was accepted practice to use a binary name for every plant and animal. Two of the most notable successors to Linnaeus in classifying were A. P. de Candolle (1778-1841), author of a botanical system with better correspondence to nature, 1824-70, and Georges Cuvier (1769-1832), whose *Le règne animal*, 1817, described a nonphilosophic system of life, based on the latest findings in comparative anatomy. Linnaeus, Candolle, and Cuvier provided the essence of modern classification.

NEUROPHYSIOLOGY

THE NERVOUS SYSTEM. The 19th cent. was the heroic age of experimentation on the nervous system. Modern neurophysiology began with Sir Charles Bell's (1774-1842) clear distinction of the anterior and posterior roots of the spinal cord as sources of motor and sensory stimuli respectively, 1811. However, it was necessary for François Magendie (1783-1855) to repeat Bell's demonstration in 1822 before general acceptance was forthcoming. Jean Marie Pierre Flourens (1794-1867) introduced the notion of nervous co-ordination, 1826, via his experiments on a dog and a pigeon deprived of their cerebellums. He also found the dependence of vision on the cerebral cortex and the importance of the semicircular canals of the inner ear for regulating movement. Marshall Hall (1790-1857) applied himself to the study of similar stimuli in a complete and a separated spinal cord. He demonstrated the ineffectiveness of voluntary action beyond the break, although a stimulus applied to the nervous system beyond the break would produce involuntary activity in the muscles, 1833. Pain was not felt in limbs beyond the separation of the spinal cord. Hall's conclusion was the hypothesis of serial segmental reflex arcs, activated by the spinal cord without need of connection to the brain.

Robert Remak (1815-65) contributed to neuroanatomy by describing the 6 cortical cell layers of the cerebrum. He noted the continuity of axons with nerve

cells in the spinal cord, and discovered the grayness of the nonmedullated, sympathetic nerve fibers, 1838. Johannes Evangelista Purkinje (1787-1869) described the nuclei and dendrites of nerve cells in 1837. Rudolf Albert von Kolliker (1817-1905) pointed out the primacy of nerve cells over nerve fibers, some of which are processes of nerve cells, 1845.

More general theory appeared in neurophysiology with Johannes Muller (1801-58), whose law of specific nerve energies, 1834-40, laid down a specificity of nerve impulse in terms of the sense organ rather than the stimulus: fire registers heat to the touch and light in the eye, and electric stimuli result in sensations characteristic of the sense organ affected. Emil DuBois-Reymond (1818-96), publishing his *Untersuchungen über Thierische Electricität* in 1848, was largely responsible for the exact study of electricity applied to animal nervous systems. His interest in this was generated by a vigorous opposition to vitalism; he predicted in this book that physiology would disappear into chemistry and physics, and then reversed himself to speak in 1872 of the inability of a physiochemical view to explain the origins and nature of life.

Otto Dieters' posthumous work, 1865, distinguishing long and short nerve processes (axons and dendrites), pointed out that nerve cells do not form networks. Camillo Golgi (1813-1926) rediscovered, 1873, Dieters' law positing 1 axon and many dendrites per nerve cell. At the same time Golgi reported his method of using silver chromate to stain the nerve elements for microscopic observation. Wilhelm His (1831-1904) showed that axons grow from primitive nerve cells, 1887. The neuron theory was fully stated in 1891 by Heinrich W. G. Waldeyer-Hartz (1836-1921). Foremost in the histology of the nervous system at the turn of the century was Santiago Ramón y Cajal (1852-1934). Ramón and Golgi differed on the neuron theory, the former upholding it. Ramón showed definitely that there is no reticulum, or continuous network, of nerve fibers. The nerve cells were found to be an insulated series with either contact or contiguity, but no con-

tinuity, 1889. Ramón's work was based upon improvements on Golgi's staining techniques, allowing Ramón to show the finer structure of the brain far more successfully than ever before.

SHERINGTON. The high point in neurophysiology came with the work of Sir Charles Scott Sherrington (1857-1952). His general method was to eliminate the brain stem, using a "spinal animal" alone; the primary animal used was the rhesus monkey, with lower animals as controls. Concentrating on spinal reflexes, he postulated the synapse, 1897, a reflex arc consisting of 2 or more neurons, as basic in all spinal reflexes. This brought into consideration the intercellular barrier and required recognition of varying ease of transition of impulses under different conditions. Sherrington's *Integrative Action*, 1906, set forth a brilliantly elaborated theory of integrated nervous action. He built up a complex system of co-ordinated motor behavior based upon the study of reflexes as the simplest expression of integrative action, the primitive elements of the theory were excitation and inhibition of impulses at the synapses. This work constituted the high point in the study of involuntary reflex actions.

CELL THEORY

GLOBULES. Another area of biology which saw its real beginning in 19th-cent. experimentalism was cell theory. Kaspar Friedrich Wolff (1733-94), in the course of his embryological studies, remarked on the microscopic "little globules" constituting all animal organs, 1759, his meaning was vague but suggestive. Of practical value in the prehistory of cell theory was the invention of slicing machines, 1780, capable of cutting as thin as .0005 in. The globular theory, quite distinct from, though ancestral to, cell theory, was advanced by C. F. B. de Mirbel (1776-1854), who observed, 1802, the universality of uniform cells, or globules, in plant structure. Even René Henri Joachim Dutrochet (1776-1847) remained within the confines of globulist theory when he de-

scribed organs as differing in the contents of their cells, but he maintained a very indefinite doctrine of the actual contents or processes of the cells. He did recognize that cells are themselves responsible for growth, 1824. The essential isolation of each cell in plants was stressed by Franz J. E. Meyen, 1830, who participated in the gradual exposition of the various parts of the cell in the 1830's.

THE CELL NUCLEUS. In cytology the 1830's brought the critical point in theoretical development, supported by better microscopy with much greater attention to details. Of primary importance in this era was Robert Brown's (1773-1858) discovery of the cell nucleus in plants. His 1833 paper on Orchidaceae and Asclepiadaceae clearly distinguished the cell nucleus from other structures, and set up the nucleated cell as the botanical unit of structure. Dumortier's observation of algal cell division, 1832, was soon followed by the similar observation, 1837, of Hugo von Mohl (1805-72), who also described in detail some of the steps of mitosis, 1835-39. 1838 saw the 1st full statement of cell theory, by Matthias Jakob Schleiden (1801-81), who conceived of the cell as the essential unit of plant life and the nucleus as its essential internal element. However, Schleiden also believed that the cellular reproduction was by free cell formation: the nuclear membrane was supposed to become the wall for daughter cells formed within a parent cell, and structures of the parent cell would dissolve to reform in the daughter. By 1844, Mohl's studies of the cell wall and the protoplasm effectively destroyed Schleiden's hypothetical mechanism of cell reproduction. In 1839 Theodor Schwann (1810-82), directly inspired by Schleiden, applied the cell theory to animals, emphasizing that the activity of the total organism is the sum of activities of essentially independent cell units. Of special importance was Schwann's recognition of 2 classes of cell phenomena, those concerning structural change and those concerning metabolic change. With respect to the latter, for example, the importance of cell membranes for separation of chemical sub-

stances was stressed, although the mechanism was conceived to be like that of a galvanic pile. Unfortunately, Schwann adopted Schleiden's system of cellular reproduction.

PROTOPLASM. In 1839 Purkinje introduced the term "protoplasm" to describe the initial product in the development of the cell. He represented only the sap and wall of plant cells as results of the protoplasm. Explanation was needed for other contents of the "sarcode" of Félix Dujardin (1801-62), who thus named the moving mass of contents between the food vacuoles of protozoa, 1835. Dujardin was concerned to put to rest the notion that the parts of microscopic animals were parallel to parts of complex, macroscopic animals. Karl Theodor von Siebold (1804-84) 1st made clear the unicellular nature of protozoans and described the function of the cilia as motive parts, 1845. Kölliker the embryologist treated the ovum as a single cell and embryonic development as cellular division, 1844. Max Schultze (1825-74) finally unified the ideas on protoplasm, protozoa, and egg cell with his idea of the cell as "a lump of nucleated protoplasm," 1861; he decided on protoplasm as "the physical basis of life" in 1863. Rudolf Virchow (1821-1902), in his *Die Cellular Pathologie*, 1858, dealt with the structure of the tissues of every bodily organ. His aphorism "every cell from another cell" was, unfortunately, linked to a doctrine of endogenous formation of cells, though the exogenous version of Schleiden was considered untenable. Initial scientific reception tended not only to criticize Virchow's weaker points but to follow traditional views of free-cell formation and spontaneous generation in preference to his improvements. Another couple of decades were needed for general approbation of "every cell from another cell."

In the 1880's Walther Flemming (1843-1915), Eduard Strasburger (1844-1912), Eduard van Beneden (1846-1910), and others worked out the essentials of cell division. Both the full details and the nomenclature for mitosis appeared at this time (1882 on). The high level of individuality in cells was shown by H. V.

Wilson, 1907. The appearance of a truly reliable and well-defined technique of culturing cells outside the body came with R. G. Harrison's paper of 1907. Henceforth cytology developed, especially in practical medical directions, with much greater rapidity than before.

MICROBIOLOGY

SPONTANEOUS GENERATION. The realm of microbiology, like many other aspects of biology, was a creation of the microscope. Anton van Leeuwenhoek (1632-1723) stood out among the early microscopists for the accuracy of his observations. Among a mass of reports on different body tissues and animals, his discoveries of infusoria, 1676, and bacteria, 1683, were especially remarkable, considering his use of only a simple lens. The observations of infusoria, apparently generated spontaneously from initially clear infusions of hay, gave rise to controversy over such generation for almost 2 centuries. An important point in this controversy came in the mid-18th cent. John Turberville Needham (1713-81) boiled mutton broth and transferred it to a perfectly sealed container. A few days later he observed that swarms of little animals had appeared in the infusion, 1748. Lazzaro Spallanzani (1729-99) felt that the state of the air in the experiment was crucial. His experiments (published 1767) compared mixtures heated to boiling in open and in closed containers. With sufficient time of heating (over ½ hr.), the sealed containers produced no organisms, no matter how long one waited. Opponents believed Spallanzani had spoiled the air and that spontaneous generation would take place in unheated air.

A new dimension appeared with chemical experiments on fermentation. It was considered to be a strictly chemical process supporting spontaneous generation. In 1836 Charles Cagniard de Latour (1777-1859) claimed that yeast is made of minute organisms, which cause fermentation. Theodor Schwann (1810-82) immediately repeated this claim. Franz Schulze (1815-73) and Schwann experimented (1836 and 1837, respectively) to

show that purified air does not support spontaneous generation. These experiments were not conclusive, and during the 1840's the chemist Liebig swayed the field with his view that fermentation was not microbial but rather a chemical process peculiar to organic matter. In 1854 Heinrich G. F. Schröder (1810-85) and Theodor von Dusch (1824-90) succeeded in filtering out bacteria from air by cotton wool. This mechanical method obviated the objections proposed by abiogenists against the use of acid baths or heat to "spoil" the air before introducing it to a boiled infusion. However, modifications of the experiment raised some questions about the universality of Schröder's and Dusch's conclusion.

PASTEUR. It was Louis Pasteur who laid to rest the question of spontaneous generation. Late in life Pasteur set down in a polemical dialogue—following the style of Galileo—the reasons for pasteurizing wines. He began his biological studies in 1854 with fermentation experiments. The ultimate result of the work was not to prove that microbes are involved in fermentation—Schwann had done this—but rather to show that the presence of microbes is the sole condition both necessary and sufficient for fermentation. Pasteur's classic experiments appeared in his *Mémoire sur les corpuscules organisés qui existent dans l'atmosphère*, 1861, where the most convincing display of his theory was made by a flask with a very long, thin, unstopped neck, bent in a horizontal "S." After prolonged heating of a decomposable substance in the flask, no putrefaction or fermentation took place for an extended period of time, yet within a few hours after breaking the neck near the body of the flask, putrefaction appeared. Only the length and angle of the neck prevented bacteria from entering, and this changed when the neck was removed. Even this experiment failed to convince everyone, and the era of belief in spontaneous generation persisted until John Tyndall (1820-93) added further experiments of a most convincing nature in his 1881 *Essay on the Floating-Matter of the Air*.

Microbiological research following Pasteur was able to deal more with questions

of detail and less with the basic issue of abiogenesis. Karl Nägeli (1817-91), known for his programmatic lack of interest in Mendel's work on genetics, was able to assert, "I have for 10 years examined thousands of different forms of bacteria, and I have not yet seen any absolute necessity for dividing them even into 2 distinct species." By contrast Robert Koch (1813-1910) made as one of his essential postulates in medical microbiology the complete correspondence of bacteria inoculated and bacteria terminally extracted in assigning the bacterial cause of a disease; extensive data were collected to support the notion of distinct species of bacteria. In 1882 Koch introduced publicly the method of plating bacteria either in (anaerobic), or on (aerobic) a culture solidified with gelatin or agar. Coupled with his perfection of the fixing of bacteria and staining with aniline dyes, Koch's culture method provided a basis essentially unchanged to date for the preparation of bacteria for study. Of special and ironic interest in the study of fermentation was the work of the chemist Eduard Buchner (1860-1917), who resolved the controversy between Liebig and Pasteur by showing fermentation in cell free extracts. Buchner demonstrated the production of a chemical ferment by the yeast fungi; the ferment could be isolated and still function to give fermentation without the fungi. 1897 Subsequent microbiological work rests more in such areas as disease research and genetics. In the 20th cent. the disappearance of microbiology as an independent field exemplifies the growing tendency toward synthesis of the branches of biology.

EMBRYOLOGY

GERM-CELL THEORY. In the 18th cent. there was disagreement about the nature of the development of the embryo. The preformation theory then held sway in, and *ipso facto* was a discouragement to, embryological research. Why investigate, if everything is ready-made from the beginning? Some preformationists went so far as to imagine miniature but mature

figures under their microscopes while examining animal ova. Charles Bonnet (1720-93) rediscovered (after Leeuwenhoek) parthenogenesis in the 'summer-hatched generations of aphids, 1745. This led him to work out a thorough preformation theory, under the influence and with the subsequent support of Albrecht von Haller. As Bonnet saw it, every egg contained within itself all the germs of all individuals to which a mother gave birth and the subsequent generations *ad aevum*. These germs had a noncorporeal aspect in Bonnet's thinking and mirrored rather well Leibniz's monad theory.

Kaspar Friedrich Wolff (1738-94) published in 1759 his *Theoria generationis*, attacking preformation theory and suggesting epigenesis, which had already been the model of Aristotle and Harvey. According to Wolff, generation means creation. By epigenesis he intended the growth of new parts, not actually present to begin with; the arbiter of direction of such growth was an "essential force" in each organism. Spallanzani, a preformationist, discovered the necessity of spermatozoa for gestation to begin in many animals, but he believed the sperms provided no added element to the embryo, only initial stimulation of the process, 1780. His "proof" was the increase in size of a frog's egg before fertilization in the mother. G. R. Treviranus (1776-1837) lent his weight to the side opposite Spallanzani when he treated spermatozoa as the analogue of pollen, 1805; this was done as part of a grand attempt to unify the various sciences of life under the heading of "biology," a term Treviranus originated.

As an age of much more systematic commitment to experimentation, the 19th cent. saw a rapid succession of observations resolving and surpassing the repetitious controversy of the 18th cent. in germ-cell theory. Étienne Geoffroy Saint-Hilaire (1772-1844) made experiments, 1822-26, in which he artificially produced abnormal developments in chicks, thereby arguing against preformation. Jean Louis Prévost and Jean Baptiste Dumas found that filtration destroyed the fecundating power of sperms, 1824. The following year

Dumas repeated and reversed Spallanzani's experiments for preformation. Dujardin, 1827, distinguished spermatozoa from infusoria and showed the production of sperms in the seminiferous tubules. In 1841 Kolliker wrote on the essential place of sperms in reproduction, noting that spermatozoa, like ova, were cellular by nature and origin. George Newport (1803-54) showed the significance of the sperm's entry point for the segmentation of amphibian eggs, 1850-51. In botany Nathaniel Pringsheim (1823-91) went beyond the primitive statement of sexuality in flowers and observed the sexual process in detail in the fresh-water alga *Vaucheria sessilis*, 1855.

In 1859 Darwin's *Origin of Species* suggested by omission a serious problem. If new species occurred, then variation is possible. But if variation is possible, why is it not rampant, and how do we account for the continued transmission of characteristics? Unfortunately, Darwin tried to answer this question—by a theory of pangenesis, 1868. Flying in the face of experimental embryology, Darwin's speculative embryology was little better than a return to the previous century. He theorized that particles from all parts of an organism pass to the reproductive material and thus determine the nature of sperm and egg. Side by side with this turning back of speculative thought, the embryologists continued their observations. In 1875 Oscar Hertwig (1819-1922) described the nuclear fusion in the formation of the zygote, a process brought over from general cytology. Hermann Fol made the 1st actual observation in detail of penetration in *Asterias glacialis* of the ovum by the sperm, 1879, marking the final datum needed to complete Pringsheim's work. Flemming, 1879, began intranuclear research with description of the splitting of chromosomes. In the study of chromosomes Eduard van Beneden demonstrated the equal number of chromosomes in every cell of any body, as well as the production of the haploid stage in meiosis, 1887. By 1892 it was possible for Theodor Boveri (1862-1915) to give the detailed stages of spermatogenesis and oögenesis. August Weismann (1834-1914) combined

in himself the knowledge of a skilled experimenter and the ability to generalize shrewdly. His concept of a substance continuous from parent to child was called germ plasm, distinct from general body cells. An elaborate hierarchy of particles and particle groups was conceived to explain heredity, 1892. Despite the perspicacity of Weismann's thinking, his speculative bent disenchanted experimentalists and made it less easy for genetic theories like Mendel's to gain general acceptance when known.

EMBRYONIC DIFFERENTIATION.

The exact differentiations involved in embryonic development have been a creation of the late 19th and 20th cents. There was, of course, some speculation in this direction as early as Wolff's *Theoria generationis* in order to support epigenetic theory. Wilhelm His developed a mechanical explanation for all biological phenomena. His student Wilhelm Roux (1850-1924) followed this direction with his program of "mechanics of development." In the spirit of Haeckel, Roux distinguished an initial period of predetermined embryonic development and a 2nd period of functional development. Support for preformation came from the application to this scheme of Roux's famous experiment on a frog's egg, 1888. Destruction of 1 half (a blastomere) left the other uninjured, and it developed as a half-embryo, presumably along a predetermined pattern. Hans Driesch (1867-1911) soon overturned this reasoning and observation by showing that 1 half a sea urchin's egg (a blastomere) will give a complete individual, differing only in size from the normal case, 1901. This same course was later found to apply to the frog as well, if great care were taken in the experiment. The discrediting of Roux's supraexperimental reasoning led to a greater attention to purely experimental results in embryology.

From the end of the 19th cent. to the mid-20th, the organization of knowledge of cell division evolved from a series of ingenious and detailed experiments. Some of these are briefly chronicled below. By constricting a newt's egg Hertwig, 1893, obtained twin embryos. His further

studies included centrifuging frogs' eggs so that the yolk collected at 1 pole and the protoplasm at the opposite pole. The result was cleavage and development only at the protoplasm pole, 1897. The various studies of abnormal cleavage were climaxed in the experiment of Jacques Loeb (1859-1924), where an enucleated half of an egg began to develop only after many divisions of the nucleate half and when a nucleus wandered from the nuclear side into the other, 1891. This experiment discredited Weismann's theory of genetic development, whereby nuclei following cell division were considered of more specific developmental potency, incapable of producing a total organism. Loeb's experiment showed the creation of a complete individual from each half of the original egg. In 1899 Loeb went on to suggest that a certain ion concentration in the environment is all the sea urchin ovum needs for parthenogenetic reproduction. From this he concluded that physicochemical explanations may be sufficient to explain embryonic development. Here Loeb indicated one of his abiding interests—the desire to develop a systematically mechanistic view of life processes.

One of the philosophical convictions of Haeckel and Roux was elaborated on an experimental basis by Hans Spemann (1869-1941). By introducing ordinary ectoderm in place of ectoderm specifically destined to form nerve cord in a newt, he observed the completely normal development of the nerve cord in the growth of the newt, 1918. This showed that there is indeed an earlier period when development of the organism seems to take a predetermined pattern, and only later do artificial changes halt or disrupt the normal process. To this discovery was added the climactic concept of an "organizer." In 1921 Spemann showed by comparing frontal and median cleavages in eggs that the gray crescent, or dorsal, region is responsible for organizing an embryonic axis. In embryos deprived of this region, though possessing as much as 3/4 of the cleavage nucleus, no more than a ventral fragment ever developed. Stohr, 1921, found trunk mesoderm to

differentiate itself enough to produce an embryonic heart. Vogt, 1925, was able to predict the destinies of various parts of amphibian blastulae. Spemann and others, 1933-34, demonstrated that even cell-free extracts from an organizer area remained capable of controlling development. The influence of biochemistry in the field became paramount about this time. Needham and Waddington found evidence, 1933-35, that the controlling element in organizers was a sterol. Brachet (1938 on) pointed to the importance of RNA (ribonucleic acids) in the development of specialized regions. This was supplemented by his suggestion, 1952, that relocation of microsomes (containing RNA) is involved in neural induction. In the 20th cent. the advance of embryology has become closely related to advances in genetics, for both have focused on intracellular studies, often on a biochemical basis.

GENETICS

MENDEL. The study of genetics probably has fewer precursors, or protogeneticists, in its history than any other area of biology. Before and contemporary with Gregor Johann Mendel (1822-84) the study of variation was conceived essentially as a population rather than an individual phenomenon. The few earlier suggestions of individual change tended to be environmentally based, as with Lamarck, and speculative. No concept of a genetic factor in individuals was previously introduced. Mendel's work appeared in articles of 1866 and 1869. From examinations of pea plants he recorded the appearance of dominant and recessive traits. By inbreeding of not only the 1st filial but succeeding filial generations with dominant and recessive traits, he found that only the recessives bred true. Interpretation of these observations via the construction of a genealogical tree gave a series of statements known as Mendel's 1st law. Wide application of the laws for inheritance of Mendelian (paired and opposed) characters has since been demonstrated. Mendel's 2nd law stated the independence of a given

pair of opposed characters from every other pair. This law has been extensively modified with the 20th-cent. discoveries concerning linked characters. It is remarkable that Mendel's hypotheses were so simple. He excluded the notion that the hereditary contributions of the parents might be unequal. He excluded the possibility of linkage of different inherited factors. Also, in his experiments most of the results were unbelievably more regular than should be expected from the standard deviation in random sampling. Only by these hypothetical and methodological simplifications is it likely that one could have achieved Mendel's results.

The monumental disregard of Mendel's work deserves comment. The journal containing his articles, though obscure, was received by both the Royal Society and the Linnean Society. The biologist Nageli, with whom Mendel corresponded extensively on inheritance, continually referred in print to the absence of strict rules for inheritance. W. O. Focke's 1881 publication of *Die Pflanzenmischlinge* referred 15 times to Mendel, but never showed comprehension of the significance of his discoveries. The biologists interested in variation were evolutionists, but they were not seeking a Mendelian type of theory.

CHROMOSOME THEORY. From Mendel to 1900 the best work relevant to genetics was done by embryologists. In 1883 van Beneden suggested genetic continuity of the chromosomes. Theodor Boveri (1862-1915) gave experimental evidence, 1887-1902, to support this, concluding, "for every chromosome that enters into a nucleus there persists in the resting stage some kind of unit, which determines that from this nucleus come forth again exactly the same number of chromosomes that entered it. . . ." The researches of Hertwig and others (1884-88) pointed to the cell nucleus as the basis for inheritance. The individuality of chromosomes was postulated in 1885 by Karl Rabl (1853-1917). It was Boveri's work which shifted biological attention from nucleus to chromosomes. In 1887 Weismann's comprehensive theory of chromosome distribution in cell division

appeared. Weismann's theory made direct conversion of observed facts from population studies into factors on the individual level. His speculations were ingenious and predicted certain discoveries, such as the occurrence of meiosis, but the nonexperimental basis of his postulates of biophore, determinant, and id (*Das Keimplasma*, 1892) excited distaste in many thoroughgoing experimentalists. The superficial similarity of Weismann's thought and Mendel's helped delay general acceptance of the latter's work after its rediscovery in 1900.

Exemplary of the evolutionist approach to inheritance was Francis Galton (1822-1911). Taking a hint from the developing field of social statistics, Galton applied statistics to the study of variation. Characteristic of his work was the law of ancestral inheritance, 1889, which predicted for each member of each ancestral generation an arithmetically determined influence on an individual. No correspondence with observed phenomena was given. This "biometrical" approach was opposed by William Bateson (1861-1926), an able polemicist and subsequently a Mendelian, in his 1894 publication of numerous examples of discontinuous variations. Whereas Galton's bell curves of distribution of variations suggested continuity or only minute discontinuity, Bateson's field work led to an emphasis on striking and large discontinuities observed in the field.

1900 marks the rediscovery of Mendel's work. E. Tschermak, Karl Correns, and Hugo De Vries (1848-1935) all published works that year with explicit references to Mendel; Correns and De Vries, when they learned of him, were already well advanced in their own work. Of some relevance is De Vries' study of *Oenothera lamarckiana* (evening primrose) in 1886 and subsequently. The striking variations, including divergent forms like dwarf and latifoliate, he interpreted as new species. He also denied the validity of the law of cleavage (Mendelian) for the primrose mutations. Discrepancies appeared when others repeated his experiments, and it was later made clear that De Vries had failed to distinguish carefully between phenotype and genotype. The weakness

of this work brought resistance to Mendel's work, as it was linked initially to that of De Vries. In 1901 Bateson had Mendel's work translated into English, for Bateson saw its significance for natural selection. After his 1904 confrontation with the biometricians at the British Association of Natural Science, Mendelian principles spread rapidly.

The developments of the 1st decade of the 20th cent. served to ensure Mendel's place in the history of genetics. In 1891 H. Henking reported the "peculiar chromatin element," lone and nonpaired in meiosis. In 1905 this was proven to be the sex determining chromosome by F. B. Wilson (1856-1939) and N. M. Stevens, the 1st case of attribution of a single characteristic to a definite chromosome. Walter S. Sutton (1876-1916) and Boveri pointed out independently, 1903, that heredity particles in general appear to be carried by the chromosomes. The conscious interrelationship of cytology and heredity research dates from Sutton's paper. W. L. Johannsen (1857-1927) substituted mutation theory for natural selection, which had been thought by evolutionists to be an active source of variation, 1903. For some time thereafter the idea of natural selection was completely discredited as a significant part of evolution. From 1905 to 1908 Bateson and R. C. Punnett published experimental studies introducing clearly the notion of particle (gene) interaction and implying by their data, though not consciously realizing, particle (gene) linkage. G. H. Hardy (1877-1947) introduced rigorous statistical reasoning into genetics, giving rise to the field of population genetics, 1908. From Hardy's paper came the awareness of a "gene-pool" concept and of evolution as a result of change in the proportional distribution of genes in a normally unchanging pool. All this was produced by Hardy's simple answer to the question whether a dominant characteristic should be expected to spread through the whole population or not.

GENE THEORY. By 1906 *Drosophila melanogaster*, the fruit fly, was recognized to be virtually "created by God solely for heredity research," as one student put it. In 1910 Thomas Hunt Morgan (1866-

1945) explained the appearance of white eye in *Drosophila* as a sex-linked characteristic. Morgan, trained as an experimental embryologist, had disliked Weismann's theories and Mendel's as well until the work of Sutton and other researchers (mentioned above) convinced him of both Mendel's validity and the significance of the sex chromosome in heredity. Morgan's subsequent gene theory, 1911, brought him a Nobel prize in 1933. The seminal contribution of his 1910 paper was the assignment of a specific gene to a specific chromosome. In 1913 A. H. Sturtevant showed definitely that genetic factors follow a linear arrangement on the chromosome. By 1915 heredity research was sufficiently advanced to see the publication of *The Mechanism of Mendelian Heredity*, a classic, by Morgan, Sturtevant, Bridges, and Muller.

In 1917 Sewall Wright published an article often regarded as a crucial point in genetics. Via his studies of the mechanism of coat color formation in mammals he laid the foundations for physiological genetics. His focus was on how the gene accomplishes its effects rather than on the mechanics of gene transmission. The study of the gene's mode of action has remained the central problem in genetics since Wright and is of critical interest in other areas of biology as well. In actual application, Wright's research direction was exceedingly difficult to prosecute because of use of the mouse. Not until 1941 was an ideal organism, the mold *Neurospora*, found for such studies by G. W. Beadle and E. L. Tatum. Their hypothesis of 1 gene acting as or through 1 enzyme was much strengthened by N. H. Horowitz and U. Leopold, 1951. Among the biochemical studies on microorganisms to determine mode of genetic action, one of the most impressive was that of O. T. Avery, C. M. MacLeod, and M. McCarty, 1944, to show DNA (deoxyribonucleic acid) of primary importance in changing the hereditary make-up of an organism.

In 1921 L. C. Dunn wrote on unit character variation in rodents. Certain mutations, Dunn showed experimentally

for the 1st time, were homologous in different species, thus providing the 1st genetical evidence directly useful in the study of evolution of natural populations.

The view of a genetic effect as due simply to presence or absence of a factor was radically changed by Sturtevant, 1925, in a study of the bar, or narrow-eyed, character in *Drosophila*. Previously, "crossing over" (exchange of homologous chromosome parts) was thought to involve equal parts. Sturtevant noted unequal crossing over, i.e., a quantitative variation, as cause of the variations in the bar characteristic, though other mutations remained susceptible of qualitative explanation only. One especially interesting result was that "... two genes lying in the same chromosome are more effective on development than are the same two genes when they lie in different chromosomes." Supporting the study of mutation in genes was H. J. Muller's application, 1927, of X rays to *Drosophila*, whereupon the mutation rate rose several thousand %. Stadler independently showed the same phenomenon in barley, 1927. This new tool has greatly assisted the study of mutation as such. In 1931 the Sutton-Boveri hypothesis was given overwhelming experimental substantiation by Harriet B. Creighton and Barbara McClintock. Their paper established in classic fashion that "pairing chromosomes, heteromorphic in two regions, have been shown to exchange parts at the same time they exchange genes assigned to these regions." The reality of simultaneous crossing over in cytological and genetic phenomena was thus admirably demonstrated. For the study of chromosomes and chromosome rearrangement and mapping, T. S. Painter introduced an invaluable aid with his discovery, 1933, of the giant chromosomes of the nuclei in *Drosophila's* salivary glands. Since then detailed cytological maps have been constructed for over 5,000 numbered bands, and the positions of genes for 400 mutations have been established.

In 1946 Joshua Lederberg and Edward L. Tatum demonstrated that gene recombination exists in the bacterium *Escherichia coli*, thus indicating sex in bacteria.

The rapid reproduction of bacteria made this discovery important, for new genetic series could be produced rapidly. With N. D. Zinder, 1952, Lederberg found the striking fact of viral transmission of hereditary materials from 1 bacterium strain (*Salmonella typhimurium*) to another, with the acceptance and reproduction of those materials by the 2nd strain. The medical significance of this discovery was immediately recognized.

An obvious classic of recent genetical literature was the model for the structure of DNA proposed by J. D. Watson and F. H. C. Crick, 1953. Their hypothesis, in agreement with all experimental data, involved a bihelical structure with the atomic sequences running in opposite directions. The suggested pairing of atoms in turn has indicated for the 1st time a possible mechanism for self-reproduction of the molecule. With this model to work from, genetics has entered a period of even more detailed and precise experimentation than before.

RADIATION EFFECTS. Genetics has constantly caught the public eye more than any other branch of biology. A notable example of the social concern of geneticists was the 1947 Genetics Conference report on the genetic effects of the atomic explosions in Hiroshima and Nagasaki. A list of 7 recommendations was made to establish a long-term government-supported research study of the affected populations. Another example of increasingly numerous statements by scientists was A. H. Sturtevant's "Social Implications of the Genetics of Man" (*Science*, 1954, pp. 405-7), which indicated the extensive, permanent, and almost totally deleterious effects of radiation on human genetics.

EVOLUTION

PRE-DARWINIAN EVOLUTIONISTS.

An area of biology which has become intimately related to genetics from the 1930's, but was initially considered irrelevant to or even antithetical to genetics, is evolution theory. Preceding the notion of biological evolution, there

existed a strong sense of cultural evolution. The 17th cent. saw a transition of religious millenary views to secular utopian theories. The correlative idea of secular progress was a strong theme in 18th-cent. Enlightenment thought, embodied earlier in Vico and later in Condorcet. An excellent example of the synthesis of religio-cultural ideas of progress with a biological—and teleological—evolution was the thought of the preformationist Charles Bonnet, his belief in the evolution of species derived from an eschatology of increasing perfection of the world after each of a series of past and future catastrophes.

Georges Louis Leclerc de Buffon (1707-88) laid down a strictly naturalistic evolution, based upon geological evolution (1749 on). Species, he felt, were clearly mutable. Erasmus Darwin (1731-1802), the grandfather of Charles Darwin, was impressed by Buffon and was led to emphasize both variability in the single attributes of species, whether from artificial or climatic or other causes, and the broad similarity among animals. The implication of his work, 1794-96, is evolution by differentiation, via acquired characteristics, from few primitive ancestors. With Buffon and E. Darwin, Jean Baptiste de Monet Lamarck (1744-1829) completed the triumvirate of naturalists most important as precursors of Charles Darwin.

GEOLOGY. An area of scientific thought initially more relevant than natural history to evolution theory was geology. Buffon's *Théorie de la terre*, 1749, made intelligent deductions from the locations of fossil shells to the redistribution of seas in time. His *Époques de la nature*, 1778, reasoned from current tidal deposits to an age of over 75,000 years for the earth, with 6 epochs. Peter Simon Pallas (1741-1811) undertook for Catherine II an exploration of eastern Russia and Siberia, 1768-74, from which he brought back a mine of information, including the discovery of "great animals of India, bones of elephants," etc., in the Siberian ice. Responsible for the 1st geological survey (1746, of France and England) was E. Guettard (1715-86),

who noted the continuity of bands of rock on both sides of the Channel and suggested the volcanic nature of mountains in central France. N. Demarest (1725–1815) 1st confirmed the latter. It was William Smith (1769–1839), a drainage engineer, who gave a sufficiently detailed account of British strata and their characteristic fossils, 1815, to initiate serious stratigraphical studies in England. In Switzerland, Horace Benedicte de Saussure (1740–99) established the importance of strata bedding in the Alps, 1786–96, noting that the strata must have been laid down on a level and then forcibly folded into their observed form.

Large-scale controversy in geology emerged in the conflict of Neptunism and Vulcanism. Abraham G. Werner (1750–1817) swayed numerous students at the Freiburg School of Mines with his view that the essential process of formation for all rocks is aqueous, or sedimentary. His diluvial (Neptunist) theory, 1774, was based on data from the Harz Mountains in Saxony and applied universally. The Vulcanist theory of James Hutton (1726–97) appeared in 1795, and can be seen as the 1st scientific geological theory, for it recognized both igneous and aqueous processes and tended much more to limit itself to observable fact. Werner's inability to explain reasonably the known columnar structure of basalt formations was exemplary of the limits of Neptunism. John Playfair's defense, 1802, of Hutton's theory was largely instrumental in its acceptance.

A principal figure in the creation of modern geology was Georges Cuvier (1769–1832), who with Alexandre Brongniart published the 1st systematic account, 1808, of strata—taking note of all fossilized fauna rather than 1 or 2—based on study of the Paris basin. In 1812 Cuvier's *Recherches sur les ossements fossiles* established the modern science of paleontology on his correlation theory, which required that all elements of an animal's (fossil's) structure be functionally consistent. Introducing the book was Cuvier's catastrophist theory of geological change, designed to explain the marked variation in fossil contents from stratum to stratum.

Epitomizing a continuing tendency to combine good fossil research with extravagant religious history was William Buckland's *Reliquiae diluvianae*, 1823, seeking to give geological support to the Genesis account of the Flood. Élie de Beaumont (1798–1874) represented the updated continuity of catastrophism with his description of mountain building, identifying 4 distinct upheaval systems in Southwestern Europe. Carrying over Hutton's Vulcanist thinking, Charles Lyell (1797–1875) insisted on the absence of variation in the forces bringing change to the earth's crust. His *Principles of Geology*, 1830–33, the origin of uniformitarian theory in geology, was a cornerstone of optimistic materialism's edifice against divine activity in nature.

DARWIN. Lyell's uniformitarian views along with Malthus' *Essay on Population*, 1798, acted as the leaven for biological data provided by the voyage, 1831–36, of the *Beagle*, on which Charles Darwin (1809–82) acted as ship's naturalist. By 1844 Darwin had drawn up his 1st sketch of the transformation of species. In 1858 appeared the joint essays of Darwin and Alfred Russel Wallace (1823–1913), who had independently conceived the theory of natural selection. Finally in 1859 the *Origin of Species by Means of Natural Selection* saw daylight. Its breadth of application made it incontrovertible on the general issue of evolution. That new species appear was thenceforth clear, but the mechanism remained debatable, despite the popular appeal of natural selection (soon current in "social Darwinism"). The problem of finding a suitable mechanism occasioned debate for another 4 decades and more (p. 944, above). The apparent conflict of evolution theory and genetics theory in explaining variation was dissolved only after the temporary replacement of natural selection by Mendelian genetics. When it was realized that each complemented the other, the areas of evolution theory and genetics blended together rapidly. Paralleling Hardy's contribution to genetics were Sewall Wright's studies on the mathematics of evolutionary variation in populations (1930 on). R. A.

Fisher pointed out, 1932, that the dominant characteristics present in wild types are due to natural selection. The study of adaptation and viability in different geographical regions was forwarded by Goldschmidt (1932 on) and Timofeef-Ressovsky, 1933. Amidst advancing techniques and more detailed studies, Theo-

dosius Dobzhansky's *Genetics and the Origin of Species*, 1937, marked the full integration of 2 long-separated areas. The modern applications of evolution theory have extended as far as scientific anthropology (Robert Redfield) and Catholic theology (Teilhard de Chardin).

Psychology

Interest in human psychology is as old as man himself. From Aristotle until the present, nearly every great philosopher has speculated about the structure and functions of the mind. But only at the end of the 19th cent. did psychology become a subject worthy of study in its own right, due to modern advances in science—improvements in the empirical method, advances in mathematics, and the development of an experimental physiology and of the theory of evolution.

BIRTH OF EXPERIMENTAL PSYCHOLOGY. Throughout the 19th cent., physiologists, developing their experiments on body functions, increasingly turned to psychological problems. Believing that sensations could be measured, several German physiologists performed the 1st experiments in psychology. Working in Leipzig, c. 1830–40, Ernst Heinrich Weber (1795–1878) studied the perception of variations in touch, weight, and vision. He investigated the sensitivity of various areas of the body by measuring the "2-point threshold"—the necessary distance between 2 compass points applied to the skin for each to be felt distinctly (*Der Tastsinn und das Gemeingefühl*, 1816). Gustav Theodor Fechner (1801–87) introduced "psychophysics," the science of the relations between mind and body (*Elemente der Psychophysik*, 1860). Johannes Müller (1801–1858) related further the mind and the body by explaining that nerves are specialized to perform specific functions (*Elements of Physiology*, 1834–40). His pupil, Hermann von Helmholtz (1821–94), did pioneering research on optics (*Physio-*

logical Optics, 1856–66) and acoustics and on "reaction time"—the amount of time which elapses between a stimulus and the response.

ASSOCIATIONISM. In England, the predominating psychology was based on "associationism". Experience was held to be the basis of all mental capacity. Alexander Bain (1818–1903) produced the 1st systematization of psychology, along associationist lines. In *The Senses and the Intellect*, 1855, and *The Emotions and the Will*, 1859, he attempted to analyze every mode of experience. In 1876 he founded *Mind*, the 1st journal devoted to psychology.

WILHELM WUNDT. Wilhelm Wundt (1832–1920) is the 1st man who can properly be called a psychologist. He, too, began as a physiologist and philosopher, but he believed that psychology should be freed from metaphysics, and set up psychology as an experimental science by founding the Psychologisches Institut—the 1st formal psychological laboratory—at Leipzig in 1879. Here virtually all the early experimental psychologists were trained, here, too, was founded a 2nd and more important psychological journal, the *Philosophische Studien* in 1881. Wundt himself rarely conducted experiments, but he always appealed for experimental proof of his theories and readily changed them in response to the results. His major works (*Grundzüge der physiologischen Psychologie*, 1873–74; *Logik*, 1880–83; *Ethik*, 1886; *Einführung in die Psychologie*, 1911) underwent considerable changes from one edition to the next. Wundt considered psychology to be the

science of conscious experience. Experience was composed of sensations, images, and feelings. The appropriate method of psychology was introspection (*Selbstbeobachtung*); experiment was to proceed by measuring stimuli and responses. At the Psychologisches Institut, notable experiments were performed on sensation and perception.

DEVELOPMENT OF EXPERIMENTAL PSYCHOLOGY. In 1883, one of Wundt's students, G. Stanley Hall (1844–1924), founded the 1st formal psychological laboratory in the U.S. at Johns Hopkins. In 1887 he began the *American Journal of Psychology*, the 1st U.S. periodical devoted to psychology. His interests were varied, and included child psychology and religious psychology. He was the 1st to use the questionnaire to study children, and later helped introduce psychoanalysis to the U.S.

James McKeen Cattell (1860–1944) was Wundt's 1st laboratory assistant. He did pioneering studies of reaction time, of attention span, and of perception time in reading. He studied the differences between individuals, which Wundt tended to ignore, and in 1894 administered the 1st mental tests to students at Columbia University, N.Y., to measure their memory, associations, and reaction time.

Francis Galton (1822–1911) was early interested in the theories of Charles Darwin. In 1869 he published *Hereditary Genius*, a discussion of the inheritance of brilliance in certain families. He later turned to experimental methods and was a pioneer in the use of statistics for psychological measurement. His *Inquiries into Human Faculty and Its Development*, 1883, described his discovery, while experimenting on association, that subjects allowed to associate freely most often spoke about their childhood and adolescence.

Hermann Ebbinghaus (1850–1909) subjected both learning and memory to quantitative treatment, 1879–84. He was the 1st to take up a psychological problem not derived from physiology. Using nonsense syllables, he studied the difficulties of memorization, the effects of overlearning, and the amount of time saved in relearning (*Memory*, 1885).

Edward Lee Thorndike (1874–1949) studied animal learning, deciding that learning is achieved by trial and error: the animals repeated accidental solving of their tasks until they had learned the solution (*Animal Intelligence: An Experimental Study of the Associative Processes in Animals*, 1898).

WILLIAM JAMES. A doctor and physiologist at Harvard, William James (1842–1910) was interested in psychology, and in 1875–4 years before Wundt—set up an informal laboratory in which his students could do psychological experiments. He took an interest also in the study of hypnotism and hysteria then going on in France, in the Darwinian theories, and in unexplainable psychic phenomena—telepathy, clairvoyance, etc. In 1884 he founded the American branch of the Society for Psychical Research (founded in England, 1882). In *Principles of Psychology*, 1890, he described mental life as a unity, a total experience which was constantly being transformed ("stream of consciousness"). He denied the possibility of studying psychology by measurement alone. He experimented on emotions and believed they were caused by physiological changes. He made a catalogue of human instincts. In *The Varieties of Religious Experience*, 1902, he made a psychological analysis of conversion, believing that it occurred through the ejection of certain elements of the personality from consciousness and the identification of the self with one purpose.

STRUCTURALISM. Under the leadership of one of Wundt's students, Edward Bradford Titchener (1867–1927), the structuralists developed experimental psychology along the lines set by the Leipzig laboratory. Titchener began a laboratory at Cornell in 1892 and in 1927 founded the Society of Experimental Psychologists. His published works include *Experimental Psychology*, 1901–5, and *A Textbook of Psychology*, 1909–10.

FUNCTIONALISM. In opposition to structuralism, which studied mental states, the functionalists concerned themselves with processes, investigating the relationships between mental and organic functions. A group of functionalists formed at

the University of Chicago, led by John Dewey (1859-1952) and James Rowland Angell (1869-1949).

WÜRZBURG SCHOOL. In Germany also an antistructuralist tendency developed at the turn of the century. Oswald Külpe (1862-1915), Karl Marbe (1869-1953), and others investigated conscious attitudes which had escaped Wundt's attention: doubt, certainty, affirmation, dissent. They were most interested in the items of experience which are not sensory in nature.

CONDITIONING AND BEHAVIORISM. The work of 2 Russian physiologists led to an entirely new theory of behavior and learning, based on reflexes. Ivan Petrovich Pavlov (1849-1936), professor of physiology at the St. Petersburg Military Medical Academy, received the Nobel prize in 1904 for his work on the physiology of digestion. His research led him to difficult problems of behavior and, in experimenting with dogs, c. 1905, he devised the method of "classical conditioning." If the ringing of a bell constantly accompanied the feeding of a dog, it could eventually cause the dog to salivate, even if no food were presented. Thus a "conditioned reflex" could be induced. Vladimir Michailovich Bekhterev (1857-1927) arrived at similar results while doing independent work (*Objective Psychology*, 1907). He developed a theory of learning through conditioned reflexes (*General Principles of Human Reflexology*, 1917).

John B. Watson (1878-1958) founded the school known as behaviorism, building a new psychological theory around conditioning (*Psychology as the Behaviorist Views It*, 1913). He treated behavior in terms of stimuli and responses alone. More recent experiments in conditioning have been performed by B. F. Skinner (b. 1904). He invented the "Skinner box," a simple rat's cage containing a bar which, when depressed, releases a pellet of food.

GESTALT. While studying the perception of motion, Max Wertheimer (1880-1943) decided that experience had to be studied as a whole, not in terms of each of its parts taken separately. In 1912, with Wolfgang Köhler (1887-1967) and

Kurt Koffka (1886-1941), he founded the Gestalt school of psychology, devoted to the study of forms, structures and patterns (*Gestalten*). Köhler applied the principles of Gestalt in his study of anthropoid apes. He discovered that the apes solved problems by sudden insight and not by trial and error; they would respond all at once to an integrated set of clues (*The Mentality of Apes*, 1917). In *The Growth of the Mind*, 1921, Koffka described learning as the progressive realization of forms, rather than an accretion of experiences.

FIELD THEORY. Kurt Lewin (1890-1947) was influenced by Gestalt, by scientific field theory, and by mathematical topology. In *A Dynamic Theory of Personality*, 1935, and *Principles of Topological Psychology*, 1936, he developed the concept of individual action within a field, a "life space" which provided certain barriers to action which could be circumvented only by leaving the field: e.g., by withdrawing into dream or daydream.

STUDIES OF SEXUALITY. Baron Richard von Krafft-Ebing (1840-1902), a German neurologist and psychiatrist, studied the influence of heredity on insanity and sexual deviation. In 1886 he produced the *Psychopathia Sexualis*, a catalogue of sexual deviations. Two common forms of sexual perversity have come to be named for the authors who 1st described them: "sadism," describing sexual gratification obtained through inflicting pain on the love object, after the Marquis de Sade (1740-1814); and "masochism," describing sexual gratification obtained by causing the love object to inflict pain on oneself, after Leopold von Sacher-Masoch (1836-95).

Havelock Ellis (1859-1939) published 7 volumes on sexuality between 1898 and 1928, collectively entitled *Studies in the Psychology of Sex*. His works were the subject of legal proceedings, but he was the 1st to succeed in publicly broaching this delicate subject. He interpreted the vast collection of data at his disposal from a biological, rather than clinical, viewpoint.

The most prominent recent writer on sexuality was Alfred Kinsey (1894-1956), an American zoologist who discovered

considerable variation in human sexual behavior among the 18,500 individuals he and his associates interviewed (*Sexual Behavior in the Human Male*, 1948; *Sexual Behavior in the Human Female*, 1953).

PSYCHIATRY. Philippe Pinel (1745–1826) was the 1st to give insanity a medical, rather than demonic, interpretation (p. 963, below). Franz Mesmer (1734–1815) discovered that he could relieve patients of their symptoms by “animal magnetism”—later called “mesmerism” and then “hypnotism.” Subsequently, French neurologists began to study neurotic behavior by means of hypnotism. At his neurological clinic in the Salpêtrière in Paris, Jean Martin Charcot (1826–93) and his pupil Pierre Janet (1859–1947) found they could cure patients by means of suggestion while they were under hypnotism. Charcot believed the hypnotic state to be a form of hysteria.

In the 20th cent. psychiatry has used several methods. Adolf Meyer (1866–1950) stressed the importance of biology, psychology, and sociology in understanding and helping patients. He urged psychiatrists to study the life history of each patient; he considered the individual both a victim and a product of his environment and experiences. Psychotherapy was widely used by psychiatrists as well as psychoanalysts. Medical means were also employed. The Viennese psychiatrist Manfred Sakel (1906–1957) began using insulin shock in 1933 to treat schizophrenia. Two Italians, Ugo Cerletti (b. 1877) and Lucio Bini (b. 1908) used electroconvulsive therapy for the 1st time in 1938. Psychosurgery—the cutting of nerve fibers to cure certain neurotic symptoms (lobotomy)—was devised in 1935 by the Portuguese neurologist António de Egas Moniz (1874–1955). New drugs known as “tranquilizers” have largely replaced sedatives. The American Psychiatric Association was founded in 1884.

PSYCHOANALYSIS. Sigmund Freud (1856–1939) was born in Moravia, received his medical degree from the University of Vienna in 1881, and then became associated with the neurologist Josef Breuer (1842–1925). While treating hysteria cases by means of hypnosis,

Breuer had discovered that a cure was often effected by catharsis: by allowing the patient to talk freely about his experiences while in the hypnotic state. Freud studied in Paris with Charcot and Janet, 1885–86, and at the renowned neurological clinic in Nancy. In 1895 Freud and Breuer published *Studies in Hysteria*. They had discovered that the neurotic's symptoms were often caused by the repression from consciousness of undesirable memories of thoughts, which the individual either could not remember or refused to recognize. Hypnosis proved useless in effecting lasting cures; furthermore, the patients became emotionally attached to the therapist (transference). Breuer felt that the method was discredited and Freud went on alone after 1895. He replaced hypnosis with the method of free association: the patient, while in a relaxed state, said anything that occurred to him, however nonsensical or immoral. In this way, repressed material was often brought to consciousness, although resistances frequently prevented this. In dreams, however, subconscious material was often allowed to reach consciousness in distorted form. Freud's theory of dream elaboration, censorship of the unconscious material, and symbolism was published in 1900 (*The Interpretation of Dreams*). By analyzing and discussing his patients' dreams, Freud was often able to bring the repressed memories to consciousness and thus to alleviate the symptoms.

Central to psychoanalysis was Freud's theory of sex (*Three Contributions to the Theory of Sex*, 1905), for he believed that libido, sexual energy, was the driving force of life, beginning at birth. The young child went through phases of sexual development, from autoerotism (love of his own body), through the Oedipus or Electra complex (love of parent of the opposite sex and competitive feelings toward the parent of the same sex), homosexuality (attachment to his playmates of like sex), to “normal” heterosexual love. The earlier attachments (cathexes) subsisted in weakened form, causing conflicts in the adult which frequently resulted in neuroses. It was, therefore, into their childhood that Freud delved for the solution to his patients' problems.

After 1900, disciples grouped themselves about Freud. He began to teach seminars in psychoanalysis in 1902, continuing as professor of neuropathology at the University of Vienna until he fled the Nazis in 1938. The earliest and most important of his followers were Karl Abraham (1877-1925), Alfred Adler (1870-1937), Sándor Ferenczi (1873-1933), Ernest Jones (1879-1958), C. G. Jung (1875-1961), and Otto Rank (1884-1939). The International Psychoanalytical Association was founded in 1910. The 1st journal of the movement was the *Jahrbuch für psychoanalytische und psychopathologische Forschungen*, 1908-14; the *Internationale Zeitschrift für Psychoanalyse* and *Imago* followed in 1912.

From 1912, Freud began to apply psychoanalysis to the study of society, religion, and anthropology, beginning with *Totem and Taboo*, 1912. Under the influence of World War I, he began to write of a death instinct that struggled in every individual against a life instinct, causing aggression and war ("Thoughts on War and Death," 1915; *Civilization and Its Discontents*, 1930). In the latter part of his life, Freud attempted to describe the mental forces which struggle against one another in each person. They were 3: the *id*, expressing the instinctual drives of the individual; the *ego*, the reality principle which adapts the individual to the requirements of society; and the *superego*, the reproving parental conscience. These theories were outlined in *Group Psychology and Analysis of the Ego*, 1920, and *The Ego and the Id*, 1923.

Alfred Adler was one of the earliest participants in the psychoanalytic movement. Interested in Freud's theory of *compensation* for deficiencies, he published *A Study of Organic Inferiority and Its Psychical Compensation*, 1907, demonstrating how social, intellectual, or physical inadequacy was compensated for by overt behavior or symptoms. These studies led him to break with the Freudian movement, 1911, and begin the school of "individual psychology." He believed that the driving force in life was the desire for power, not libido. He called admitted inferiority the *inferiority complex* and showed how the attempt to overcome it could lead to aggressiveness.

Carl Jung was also unable to accept the primacy of sexuality as stipulated by Freud and left the psychoanalytic movement in 1913 to practice "analytical psychology." He studied the effects of heredity and of spiritual forces on the mind; he spoke of the "collective unconscious," mythic material which he felt to be inherited by members of a culture. He classified individuals according to basic psychological categories, coining the terms "extrovert" and "introvert" (*Psychological Types*, 1920).

SOCIAL PSYCHOLOGY. William McDougall (1871-1938) was interested in the irrational foundations of behavior. In *An Introduction to Social Psychology*, 1908, he developed a theory of human behavior based on inherited instincts and an acquired superstructure of sentiments. He saw social life as the product of instincts. In *Instincts of the Herd in Peace and War*, 1916, Wilfred Trotter (1872-1939) described World War I as a clash of instincts. McDougall himself began studying abnormal psychology while in the British army during the war. He published an *Outline of Abnormal Psychology* in 1926.

CHILD PSYCHOLOGY. The most important child psychologist of the 20th cent was Jean Piaget (b 1896). His major theory (expounded in *The Language and Thought of the Child*, 1923; *The Child's Conception of the World*, 1929; *The Moral Judgment of the Child*, 1932) treats of the child's egocentricity; he accepts his own viewpoint as the objective one and fails to distinguish himself from what is external, so that he attributes life to all he encounters. Piaget considered intellectual development to be a gradual emancipation from the egocentric way of thought.

Child psychoanalysis was developed notably by Anna Freud (*Einführung in der Technik der Kinderanalyse*, 1927) and Melanie Klein (*The Psychoanalysis of Children*, 1932).

INTELLIGENCE AND PERSONALITY TESTING. Alfred Binet (1857-1911) founded the 1st French psychological laboratory at the Sorbonne in 1889 and the 1st French psychological journal, *L'Année psychologique*, in 1895. He de-

vised the 1st intelligence tests for school-children in 1905. The tests, revised in 1908 and 1911, were arranged for the age levels at which the average child could be expected to do them satisfactorily. A child's "mental age" was the level he attained on this scale. The German psychologist Wilhelm Stern (1871-1938) suggested that absolute retardation or advancement in years was less important as a measure than relative retardation or advancement. In 1911 he introduced the intelligence quotient (IQ), determined

by dividing mental age by chronological age. The "Stanford revision" of Binet's test, 1916, has been the most widely used of intelligence tests.

The Swiss psychiatrist Hermann Rorschach (1884-1922) began in 1911 to use a group of ink blots in order to compare normal, neurotic, and psychotic personalities. By showing the subject an ink blot and asking him to state what he saw in it, Rorschach was able to classify many personality types. A standard set of "Rorschach prints" has been widely used.

Medicine

EARLY MEDICINE

SYSTEMATIC CLINICAL INSTRUCTION. The establishment of systematic clinical instruction, the hallmark of modern medical education, dates from the 17th-18th cents. The Leiden School in the Netherlands, after Hermann Boerhaave (1668-1738) became a teacher there, 1701, provided the model for modern medical bedside teaching. Early imitators of Boerhaave's methods included Archibald Pitcairne (1652-1713) at the College of Physicians in Edinburgh, founded in 1681, and Gerard van Swieten (1700-1772) at the Old Vienna School, founded c. 1745.

RISE OF SCIENTIFIC PHYSIOLOGY. Boerhaave's *Institutiones medicae*, 1708, were widely adopted, but it was his pupil, Albrecht von Haller (p. 939, above), who started physiology on its modern career with his *Elementa physiologiae corporis humani*, 1757-66. In addition to his work on the nervous system, Haller's studies of respiration, bone formation, and embryology were influential. Combined with the work of Stephen Hales (p. 939, above) on blood pressure, quantity, etc., 1740's, the advances of Boerhaave and Haller marked the rise of scientific physiology.

DEVELOPMENT OF DIAGNOSTIC TECHNIQUES. Basic modern diagnostic techniques were devised in the later 18th

cent. Only as a result of the work of Giovanni Battista Morgagni (1682-1771) was morbid anatomy made a regular part of medical analysis. After his time the anatomical location of lesions became a routine concern of pathologists. Leopold Auenbrugger (1722-1809) 1st noted the medical value of the characteristic resonances of various parts of the body. His invention of percussion as a medical device, 1761, was simple and basic. Of similar value was the invention of the stethoscope, 1819, and the practice of auscultation by R. T. H. Laennec (1781-1826). For over half a century, however, the stethoscope remained in its less dependable, monaural form.

BEGINNING OF OCCUPATIONAL MEDICINE. *On the Disease of Artificers*, the 1st work on occupational disease, was published, 1700, by Bernardino Ramazzini (1633-1714) of Modena. In 1831 Charles Turner Thackrah (1795-1833) published *The Effects of Arts, Trades and Professions on Health and Longevity*. Thackrah's comprehensive study of industrial disease and poverty renewed interest in occupational medicine (which had lapsed since Ramazzini's time) and special attention was given from this time onward to health and safety measures in industry.

BEGINNING OF PEDIATRICS. *A Treatise on the Diseases of Children*, by Michael Underwood (1737-1820), ap-

peared in 1784. The book remained the standard pediatric reference until supplanted, 1848, by *Lectures on the Diseases of Infancy and Childhood*, by another Englishman, Charles West (1816-98). In France the most significant publication in the field was the *Practical Treatise on Diseases of Children* by Frédéric Rilliet (1814-61) and Antoine Barthez (1811-91), 1838-40. In Germany the *Handbuch der Kinderkrankheiten* began publication in 1877. The German immigrant physician, Abraham Jacobi (1830-1919), was the chief pioneer pediatrician in the U.S.

PATHOLOGY AND THE STUDY OF INFECTION. Sir John Pringle (1707-82) recognized the danger of putrefaction, 1750, and managed to have some influence in favor of antiseptics in British military hospitals. It was long, however, before his and similar views were influential (as is shown by the handbooks used by surgeons at the time of the American Civil War, when suppuration and septic conditions were still regarded as normal). James Lind (1716-94) noted the importance of lemon juice as a preventative of scurvy, 1753, and made improvements in shipboard hygiene, 1757, including the drawing up of rules for the prevention of typhus.

CLAUDE BERNARD. The outstanding medical physiologist of the mid 19th cent. was Claude Bernard (1813-78). From him stem 3 discoveries of primary importance. The vasoconstrictor function of the cervical sympathetic nerve was observed in 1852, and vasodilation by nerves like the submaxillary in 1857. By the latter date Bernard had recognized that the vasomotor nerves affect capillaries, not arteries or veins. Bernard's investigations produced 2 especially notable facts about the digestive system. The 1st was the discovery of the digestive function of pancreatic fluid. Comparative anatomical dissections alerted him to the digestion of fat into fatty acid and glycerol below the entrance of the pancreatic duct into the intestine. He also noted production of maltose from starch by the pancreatic juice, 1848. His most outstanding experimental work, however, led to the discovery of glycogen in the

liver, 1857. His experiments were related to the debate as to whether or not animals could synthesize complex substances like fats and sugars. The laboratory procedure of Bernard in investigating the conditions of the existence of sugar in the liver and its possible sources is a classic of experimental procedure. (The ramifications of his discovery have extended as far as the Cori cycle, a biochemical cycle based on glycogen, for which C. F. and G. J. Cori received the 1947 Nobel prize in medicine and physiology.) Bernard's *Introduction à la médecine expérimentale*, 1865, established itself both as a medical and as a philosophical classic. Together with the works of Descartes, the *Introduction* still forms part of a basic education in a French lycée.

RUDOLF VIRCHOW. A towering figure among pathologists was Rudolf Virchow, a student of Johannes Müller. Contributing significantly to an understanding of thrombosis and pyemia, Virchow made his greatest contribution as a result of microbiological work (*Die cellular Pathologie*, 1858). This study both demolished unsatisfactory theories of "humors" and prepared the ground for new investigations. The cellular basis for studying inflammation led Virchow to the correct explanation of leukemia and to the distinction between the myeloid and lymphatic types.

THE FIGHT AGAINST COMMUNICABLE DISEASE

SMALLPOX. Smallpox inoculation using serum from mildly infected patients was advocated by Cotton Mather (1663-1728) in the American colonies and was successfully practiced there by Zabdiel Boylston (1679-1766). The inventor of smallpox vaccination, however, was the Englishman, Edward Jenner (1749-1823). Jenner's contribution was his recognition, 1796, of the way in which cowpox disease can pass from person to person indefinitely and in undiluted strength. The use of fluid from a human cowpox pustule became a widespread and effective preventive measure against smallpox.

GERM THEORY. Louis Pasteur's demonstration of the germ-bearing capacity of the air (p. 943, above) was the biological basis for his specialized studies on various diseases, such as the French silkworm disease, 1866, and anthrax. Contemporaneously with Robert Koch (p. 943, above), Pasteur worked out the reasons for the deadly and apparently irrepressible outbreaks of anthrax among European, especially French, cattle. Pasteur had witnessed the forming of bacterial spores in fermentation and in the process of the silkworm disease. It was Koch who 1st worked out the importance of bacterial spores, encysted bodies highly resistant to destruction. The necessity of a minimum heat and an amount of oxygen was established by Koch, 1876, for the production of anthrax spores. The purely microbial origin of anthrax was subsequently clarified by Pasteur, 1877, who learned the possibility of weakening anthrax bacillus to prevent the appearance of spores, thus producing an effective agent for anthrax inoculation, 1880. Pasteur's preparation of a treatment for incipient rabies, 1885, followed the same principles.

DIPHTHERIA. Diphtheria was 1st clearly distinguished from scarlet fever by Pierre Bretonneau (1771-1862) of Tours, France. Its bacterium was discovered by Klebs, 1883, and Loeffler, 1884, and Bela Schick (b. 1877) introduced, 1913, the "Schick test," a skin test which indicates susceptibility to diphtheria. The disease was dramatically reduced in incidence when those showing Schick-positive reactions were immunized with antitoxin serums 1st developed, 1891, by Emil von Behring (1854-1917).

TYPHOID. Typhoid and typhus fever were first clinically differentiated by William W. Gerard (1809-72) in 1837. In the mid-19th cent. William Budd (1811-80) suggested that typhoid was transmitted by the ingestion of infected material and that a contaminated water supply resulting from defective sewers was likely to be particularly responsible for spreading the disease. Further steps toward conquering typhoid, however, could not be taken until Carl J. Eberth (1835-1926) recognized the typhoid bacillus, 1880,

and Georg Gaffky (1850-1918) isolated it in a pure culture, 1884. In 1896 Georges F. Widal (1862-1929) developed a diagnostic test for enteric (typhoid) fever, and in the same year Sir Almroth Wright (1861-1947) discovered the killed-virus vaccine which has had great success in immunizing against the disease. Karl Wilhelm von Drogalski (1871-1950), director of the Saarbrücken Typhoid Station, Germany, discovered, 1903, an individual with no past history of enteric fever excreting the organism. Shortly afterward several other healthy carriers of the disease were also found. "Typhoid Mary," the best-known of these individuals, worked as a cook in the U.S. and infected at least 26 persons with enteric fever between 1900 and 1907.

CHOLERA. The 1st great cholera epidemic swept through Europe in 1831-32. This catastrophe greatly increased interest in public-health measures. Following a cholera epidemic in London, 1848, John Snow (1813-58) suggested that the disease was spread by consumption of contaminated water. Six years later he produced epidemiological proof of this theory by demonstrating that water drawn from a pump in Broad Street, City of London, had been directly responsible for over 500 of the deaths which had occurred during the cholera epidemic of 1851. In 1883 Robert Koch discovered the organism *vibrio cholerae*, which causes cholera. Theobald Smith (1859-1934) proved, 1886, that injection with a filtered virus obtained from infected hogs provided immunization against the disease.

TUBERCULOSIS. In 1859 Hermann Biehmer (1826-89) opened the 1st successful tuberculosis sanatorium at Görbersdorf in Silesia. Similar institutions were soon established in other countries. In the U.S. Edward Trudeau (1848-1915) founded the well-known sanatorium, 1884, and laboratory for the study of tuberculosis, 1891, at Saranac Lake, N.Y. In 1865 the experiments of the French military surgeon Jean Antoine Villemin (1827-92) proved tuberculosis to be an infectious disease, and in 1882 Robert Koch (1813-1910) discovered its cause, the tubercle bacillus. Early diag-

nosis was aided by Röntgen's discovery of the X ray, 1895, and in 1898 Theobald Smith distinguished 2 types of tubercule bacilli, human and bovine. Inoculation against tuberculosis, using five but attenuated tubercule bacilli vaccine, was introduced in France, 1921, by Albert Calmette (1863-1933).

YELLOW FEVER. In 1881 Carlos Finlay (1833-1915) of Havana, Cuba, first suggested that the *Aedes aegypti* mosquito was the transmitter of yellow fever. Not until 1900, however, did a commission headed by Walter Reed (1851-1902) of the Medical Corps of the U.S. Army prove Finlay's theory by means of massive experiments on volunteer civilians and soldiers. William Gorgas (1854-1920) made the 1st practical application of Reed's findings. In 1898 the extremely high mortality rate from yellow fever among soldiers in Havana caused the U.S. Army to send Gorgas there as its chief sanitary officer. Operating at 1st on the theory that yellow fever was a filth disease, Gorgas initiated measures to improve the city's sanitation. His improvements drastically lowered the incidence of malaria, typhoid fever, and dysentery, but had no appreciable effect on yellow fever. When Reed's findings became known in 1901, Gorgas instituted stringent measures designed to eliminate the mosquito from the environs of Havana. His efforts were highly effective. In 1904 he was placed in charge of a sanitation team charged with eradicating yellow fever from the Canal Zone. In attempting to isolate the microorganism responsible, false starts were made by men as eminent as Hideyo Noguchi (1876-1928), one of many physicians to succumb to yellow fever. Not until 1927 were researchers successful in infecting experimental animals. The virus was found, 1933, to be one of the smallest known. Max Theiler (b. 1899) and others finally produced a satisfactory vaccine, 1937.

MALARIA. Discovered, 1880, by Charles L. A. Laveran (1845-1922), the malaria parasite was observed through its asexual stages in erythrocytes by Ettore Marchiafava (1847-1935) and others. Golgi (p. 940, above) noted the coincidence of the fever phase with rupture of

red blood cells, 1885. It was Sir Ronald Ross (1857-1932) who painstakingly dissected anopheles mosquitoes for evidence of malaria as well as culex mosquitoes for bird malaria parasites. In 1898 he observed the complete cycle, both asexual and sexual, for bird malaria, and failed to see each stage in *Plasmodium* only because he was transferred—at the time he was in the India Medical Service of the British army—to another area and assignment. The observations were actually made by Amico Bignami (1862-1929), Giuseppe Bastianelli (1862-1959), and Giovanni Grassi (1854-1925) in all 3 species of *Plasmodium*, 1899. In the same year Ross was able to return to his investigations and verified the work of the Italians. He received the Nobel prize in 1902.

INFLUENZA. In 1946 a World Influenza Center was established in London to prevent a recurrence of the pandemic of 1918-19, when more than 15 m. people died of influenza. By identifying the virus at the time of an outbreak and quickly developing a vaccine to combat it, the Center was able to reduce the fatality rate during the influenza pandemic of 1957-58.

POLIO. In 1949 John F. Enders (b. 1897), Thomas H. Weller (b. 1915), and Frederick C. Robbins (b. 1916) of Harvard Medical School demonstrated that polio virus could be grown in cultures of nonnervous human and monkey tissues in quantities sufficient for use in preparing a vaccine. In 1953 a vaccine was constructed from 3 strains of inactivated polio virus by Jonas E. Salk (b. 1914) and, after successful laboratory tests, 1,830,000 U.S. schoolchildren were vaccinated. Evaluation of this further massive testing showed that the Salk vaccine provided active immunity for at least 6 mos., and that booster injections provided further protection. In 1961 an even more effective live-virus vaccine developed by Albert B. Sabin (b. 1906) was licensed.

SURGERY

STERILIZATION. At the Vienna General Hospital, Ignaz Philipp Semmelweis (1818-65) was aroused by the death rate

(10–30%) in the obstetrics ward. Puerperal fever, he suggested and then proved, 1846, was induced because attending physicians came from the post-mortem room to the maternity patients without any sterilization. The incidence of puerperal fever was reduced to about 1% through his insistence on sterilization, yet the idea aroused opposition and was discarded until the time of Lister. Nor was Semmelweis' article on the disease published until the beginning of the antiseptic era, 1861. That an idea will not prevail in the absence of a proper milieu is indicated by the similar neglect of the work, 1795, of Alexander Gordon (1752–99) stressing the need for sterilization to prevent puerperal fever. It was the public insistence, 1843 and 1855, of Oliver Wendell Holmes (1809–94) which led to adherence, in the U.S., to Gordon's and Semmelweis' recommendations.

JOSEPH LISTER. Joseph Lister (1827–1912) is considered the author of the fundamental revolution in surgery—the antiseptic method. In the mid-19th cent. blood poisoning, erysipelas, pyemia, and gangrene (called “hospital gangrene”) were considered normal accompaniments of the healing of a wound. Lister made a preliminary study of the early stages of inflammation in 1858, but it was Pasteur's work on air-borne bacteria that opened his eyes to the medical significance of sterilization. By 1870 he was practicing effective antiseptic surgery and gradually introduced less drastic antiseptics. By 1879 Sir William Macewen (1848–1924) had given up Lister's carbolic spray and had, in fact, been practicing essentially aseptic—as opposed to antiseptic—surgery earlier. The introduction of aseptic surgery was made possible by the same revolution in bacteriology that inspired Lister.

ANESTHESIA. Despite occasional use of nitrous oxide and ether by earlier surgeons, William T. Morton (1819–68) was the 1st to make extensive attempts to inform the medical world of the value of anesthetics, 1846. Sir James Young Simpson (1811–70) sought an alternative to ether, which was favored by Morton, because of its unpleasant effects on some patients. He established chloroform, 1847,

as an effective substitute in general anesthesia. From this time onward, neatness and thoroughness could replace speed as the mark of a good surgeon.

APPENDICITIS. Henry Hancock (1809–80), a London surgeon, performed the 1st operation for peritonitis, 1848, although at that time it was not recognized as such. In 1886 Reginald Haber Fitz (1813–1913) of Philadelphia established “appendicitis” as a lesion. In the same year Rudolf Ulrich Kronlein (1847–1910) performed the 1st appendectomy, but credit for the 1st successful operation following the correct diagnosis of a perforated and abscessed appendix goes to the Philadelphian, Thomas George Mason (1835–1903). In 1889 Charles McBurney (1845–1913) of New York recognized inflammation of the lower right abdomen to be a symptom of appendicitis.

CORNEA TRANSPLANTS. The 1st cornea transplants were achieved in 1905. Receiver rejection of the new tissue was not a problem in these early homografts—transplants between 2 unrelated individuals—since the cornea is the transparent cover of the eyeball and has no blood circulation.

HEART SURGERY. The development of various electrical graphing devices (p. 961, below) greatly assisted in the establishment of viable techniques for surgery on the heart. In 1939 Gross began arterial canal surgery, and in 1944 the concept of compensatory heart surgery was put forward by H. Taussig. An early example of the latter technique was Blalock's anastomosis between an aorta branch and a branch of the pulmonary artery, 1915. In 1966 Michael De Bakey, (b. 1908) of Houston, Texas, successfully utilized a “left ventricular by-pass,” allowing the device to assume the function usually performed by the left ventricle for 10 days, during which time the patient's heart was able to recover sufficiently to permit removal of the by-pass.

ORGAN TRANSPLANTS. The 1st complete explanation for the major problem in transplant operations, recipient rejection of the donor's tissue, was offered by Sir Peter B. Medawar, 1953, who demonstrated the manner of functioning in this connection of the white blood cells.

The following year Joseph E. Murray of the U.S. performed the 1st successful kidney transplant. In this instance the problem of rejection was not present, since the donor was the identical twin of Murray's patient.

However, since 1954 new methods of blocking tissue rejection have permitted kidney transplants between individuals with a dissimilar genetic background. More than 1,000 such operations have been performed, and some patients have survived for more than 5 years with kidneys from unrelated donors. An important step toward successful heart transplant was taken in 1961, when James D. Hardy (b. 1918) of the University of Mississippi Medical Center attempted to transplant the heart of a chimpanzee to a dying man. The heart failed after an hour and a half.

The 1st successful heart transplant between 2 humans occurred on 3 Dec., 1967, when Christiaan N. Barnard (b. 1933) of Capetown, South Africa, replaced the heart of 55-year-old Louis Washkansky with that of 25-year-old Denise Darvall. Several hundred similar operations have since taken place throughout the world. During 1966 and 1967, liver and pancreas transplants were also attempted, but no patient survived these operations for longer than 5 months.

SPECIALIZED BRANCHES OF MEDICINE

NEUROLOGY. The creator of neurology as a distinct discipline was Moritz Heinrich Romberg (1795-1873), whose *Lehrbuch der Nervenkrankheiten des Menschen*, 1840-46, had wide influence. It dealt primarily with disorders of the peripheral nerves and also with locomotor ataxia. The 2nd great textbook in neuropathology, 1872-87, came from the hand of Jean Martin Charcot (1825-93). Another of Charcot's works, 1876, presented the clinical side of human cortical motor centers. Localization of the poliomyelitis lesion in the spinal cord was a further contribution of Charcot.

ENDOCRINOLOGY. Endocrinology provides a striking example of the con-

tributions of biology and chemistry to medicine. Not until 1922 were investigators successful in extracting the hormone insulin, hypothesized to be in the pancreas by J. de Meyer in 1909. The preparation of insulin went through various improvements, 1926, 1936, and the formula was established in 1953. The 1st hormone synthesized was adrenalin, 1904, whose release into the system by the splanchnic nerve because of environmental conditions was shown by W. B. Cannon in the 1920's. The growth hormone in the anterior pituitary was established by Evans, 1921, and its control over gonads, thyroid, and suprarenal cortex was then shown by P. E. Smith. The sex hormones were conceived of as early as 1849 by Berthold after experiments on chickens. Testosterone was 1st extracted in pure form by Laqueur, 1935. The embryological importance of androgens was clarified by Jost, 1917, who pointed to their action in developing the male genital passages from the female prototype. Estrogen was suggested by the production of estrus in bitches after administration of an ovarian extract, 1906. The presence of estrogen was shown in the Graafian follicle by Doisy, Allen, and Courrier, 1924, and in the urine of pregnant women by Ascheim and Zondek, 1927. The isolation of progesterone, the preparative for gestation, was accomplished in 1934. Also of note are the adrenocortical hormones, recognized to be of wide efficacy. A variety of cortisones synthesized in the 1940's and 1950's were applied with remarkable success to such diseases as arthritis, Addison's disease, asthma, dermatitis, carditis, etc.

BIOPHYSICAL DIAGNOSTIC TECHNIQUES. The effective use of the X ray in diagnosis dates from c. 1913. The application of electrocardiographs to humans by A. D. Waller, 1887, only became common after the introduction of the string galvanometer, 1903. Hans Berger, 1924, began systematic and fruitful use of electroencephalographs (EEG). In the 1930's and later, characteristic cerebral waves were established as distinctive of certain diseases and effects. In 1929 Adrian and Bronk introduced the electromyograph, but only from 1940 onward was it possible to correlate recordings

with disorders. From 1934, with the discovery of artificial radioactivity by Joliot and Joliot-Curie, it has been possible for biologists and physicians to trace virtually all elements in human physiology through the system. The minute amounts of radioactive element needed have allowed the tracing of iodine in thyroid functioning, of iron in hemoglobin formation, and of tritium in nucleic-acid synthesis.

CANCER RESEARCH. As early as 1889 Hanau succeeded in grafting cancer. In the period 1916–21 Yamagiwa and Ichikawa 1st produced cancer artificially when they repeatedly applied tar to rabbits' ears. Ross had already shown that only a small fraction of tar is carcinogenic, 1913, and in 1932 it took 2 tons of tar to produce 7 grams of carcinogen. The steroid composition of carcinogens has led to extensive studies of the possible interrelationships of hormones and cancer. Loeb prevented mammary cancer in mice by removing the ovaries, 1919, and Lacasagne induced mammary cancer by injecting estrogen, 1932. Borrel, 1930's, pressed the view that a parasitically introduced virus is responsible for cancer. Whether viral or otherwise, cancer is usually studied now as more related to environmental than constitutional factors. The apparent connection of cancer and cigarette smoking (p. 968, below) is a prime example of this direction in cancer research.

CHEMOTHERAPY. The term "chemotherapy" was coined by Ehrlich, c. 1905. German industrial production of dyes created many by-products, some of which were discovered to be medicinally useful. Various febrifuges and analgesics, including aspirin and phenacetin, appeared at the turn of the 20th cent. Ehrlich's notion was of a specific treatment for a specific disease. He was especially impressed by the specificity of action of antibodies in the blood, and sought chemicals which would act with the same accuracy and, in consequence, safety. His discovery of salvarsan, an organic arsenical, as an effective treatment for syphilis, 1911, was the initial practical model for chemotherapy—synthetic and specific medication. As a result of World War I

the Germans set out to synthesize a substitute for natural quinine in case of wartime restriction of the natural supply. As a result of their efforts and those of others, 'quinacrine' (Atebrin), 1934; chloroquine (Aralen), 1939; chloroguanide (Paludrine), 1946; and Daraprim, 1951, were produced.

Less specific chemotherapeutics resulted from the discovery of Gerhard Domagk (1895–1964) that the synthetic dye prontosil red protected mice against streptococci, 1935. Investigation showed that the colorless component of prontosil, sulfanilamide, was an antibacterial agent. Other sulfonamides were later produced, notably sulfapyridine, and gave protection against diseases like erysipelas, puerperal fever, pneumonia, and gonorrhea.

Chemotherapy entered the field of non-synthetic as well as nonspecific drugs with the discovery of penicillin. Sir Alexander Fleming (1881–1955) discovered the penicillin mold inhibiting growth in cultures of a common coccus, 1928. He named it and studied both its activity and toxicity to animals. Only with the increased attention to chemotherapy following discovery of the sulfonamides did researchers devote enough time to penicillin to concentrate it effectively. Earlier tests with insufficient supply and inefficient production had brought partial cure and then relapse and death in seriously ill patients. Howard W. Florey (b. 1898) and Ernst B. Chain (b. 1906) finally concentrated penicillin, 1939, and showed its low toxicity and broad-spectrum applications in both animals, 1940, and humans, 1941. In 1944 Selman A. Waksman (b. 1888) isolated streptomycin from a newly discovered fungus, and found the substance especially effective against tuberculosis. The tendency of streptomycin-resistant types of tubercle bacilli to appear in response to treatment was met by William H. Feldman, who introduced para-aminosalicylic acid and isonicotinic acid hydrazide in combination with streptomycin in order to prevent the resistance build-up. The 1st synthetic antibiotic was chloramphenicol, 1947, useful against typhoid and paratyphoid, which are untouched by penicillin. Duggar found

aureomycin in 1948, and terramycin was discovered by Finlay's research team. 1950. Both are wide-spectrum and can be taken orally.

MENTAL HEALTH

ABOLITION OF PHYSICAL RESTRAINTS. In 1788 Vincenzo Chiarugi (1739-1820) abolished all forms of restraint at the Boniface Asylum in Florence, and in 1793 Philippe Pinel (1745-1826) unshackled the patients at Bicêtre, the Paris asylum for men. Previously, the "treatment" of lunatics had included incarceration and occasional torture. Thomas Kirkbride (1809-83) and Benjamin Rush (1715-1813) followed their example in the U.S., and the Quaker, William Tuke (1732-1822), and his son, Henry Tuke (1755-1814), reduced the use of restraint in England. However, no institution abolished all forms of mechanical restraint until 1839, when the reformer, John Conolly (1791-1866), was appointed resident physician at the Middlesex Asylum at Hanwell, the largest mental hospital in England. The corollary of constant observation was stressed as well. Early publications in the field of mental health include Philippe Pinel, *Medico-Philosophical Treatise on Mental Alienation*, 1801; Jean Étienne Dominique Esquirol, *Des Maladies mentales*, 1838, the 1st true textbook of psychiatry. Vincenzo Chiarugi, *On Mental Diseases in General and in Particular*, 1793-94, and Benjamin Rush, *Diseases of the Mind*, 1812.

CAMPAIGN FOR BETTER MENTAL HOSPITALS. A memorial to the legislature of Massachusetts, 1813, inaugurated the campaign of Dorothea Dix (1802-87) to obtain better-equipped institutions for the mentally ill. Through her efforts 32 asylums were established or enlarged in the U.S. and Europe.

INFLUENCE OF FREUD. The Viennese physician Josef Breuer (1842-1925) was the 1st to use hypnosis to allow his patient to achieve emotional "catharsis" 1880-82. Following this success, he was joined by Sigmund Freud (1856-1939) and together they published, 1895, their observations on this technique in *Studies on Hysteria*. Breuer failed to pursue these findings, but Freud continued the work. The appearance of his book *Interpretation of Dreams*, 1900, marked the beginning of modern psychoanalysis (p. 954).

SHOCK TREATMENT. Julius von Wagner Jauregg (1857-1910) 1st used shock therapy, 1917, to treat certain types of severe melancholia and depression. In 1933 Manfred Sakel (1900-1957) of Vienna introduced the use of insulin in shock therapy, and in 1938 2 Italian physicians, Ugo Cerletti (b. 1877) and Lucio Bini (b. 1908), improved the technique by using electricity to produce the necessary convulsive state. In recent years the widespread use of tranquilizers has caused a decline in all types of shock treatment.

LOBOTOMY. Antonio de Egas Moniz (1874-1955), a Portuguese neurologist, performed the 1st prefrontal lobotomy, 1935. This was the 1st time brain surgery had been used to treat mental illness.

Public Health

MEDICAL EDUCATION AND HOSPITALS

LONDON DISPENSARY. In 1696 the London Dispensary, the 1st clinic in the English-speaking world, was opened to dispense medicines to the sick poor. In 1771, 1786, and 1796 similar dispensaries

were founded in New York, Philadelphia, and Boston respectively.

EARLY HOSPITALS. In the 18th and early 19th cents. many of the great hospitals of Britain, the U.S., and Western Europe were either founded or rebuilt: St. Bartholomew's, 1730, and the London Hospital, 1752, in Britain; 'Allgemeines

Krankenhaus, 1774, in Vienna; Philadelphia General, 1752, New York Hospital, 1771, and Massachusetts General, 1811, in the U.S. The Foundling Hospital of London, the 1st institution for unwanted infants, was opened by Thomas Coram (1668-1751) in 1739.

MEDICAL EDUCATION IN THE U.S. The 1st medical faculty in the U.S. was established at the College of Philadelphia, 1765. In 1768 medical instruction was given at King's College; 1783, Massachusetts Medical School; 1798, Dartmouth; 1799, Transylvania; 1810, Yale; 1807, College of Medicine (Md.).

GOVERNMENT FINANCING OF HOSPITALS. In 1831 in Denmark and Sweden a hospital system financed by taxes was instituted.

BEGINNING OF NURSING EDUCATION. In Ireland, Catherine McAuley (1787-1841) started the Sisters of Mercy, and Mary Aikenhead (1787-1858) founded the Irish Sisters of Charity, 1834, for the improvement of nursing. Two years later Theodor Fliedner (1800-1864) opened a small hospital in Kaiserwerth, Germany, and began training 6 young "deaconesses" according to the hygienic principles of the English Quaker philanthropist, Elizabeth Fry (1780-1845). Although Kaiserwerth is important in the history of nursing reform, instruction there and at other institutions modeled after it consisted primarily of several months of daily attendance at a hospital where the student learned as much as possible from the untrained nurses on duty. Among the deaconesses trained at Kaiserwerth was Florence Nightingale.

MEDICAL ETHICS. The British physician Thomas Percival (1740-1804) drew up a comprehensive scheme of medical conduct. His work, *Medical Ethics*, remains a standard in the field.

REGULATION OF THE MEDICAL PROFESSION. The British Medical Act of 1838 established a General Medical Council to control entry into the medical register, thereby standardizing medical education and examinations. In the U.S. the Council on Medical Education and Hospitals of the American Medical As-

sociation (established in 1847) took on the supervision of the quality of medical education. In most countries today medical education is state-controlled. Only those physicians whom the General Medical Council admits to the register are licensed in Britain and the Commonwealth countries, although in Britain unlicensed doctors are allowed to practice. In most Western European countries, the USSR, China, and Japan, graduation from state-controlled medical schools serves as a license to practice. In the USSR each doctor must also practice in an assigned location for 3 years. Licensing of doctors in the U.S. is controlled by each state, there are no national laws.

WOMEN IN MEDICINE. Elizabeth Blackwell (1821-1910), the 1st woman to receive an M.D. degree, graduated from the Medical School at Geneva, N.Y., 1849. Women's Medical College of Pennsylvania, the 1st medical school to instruct only female students, opened in 1850.

MEDICAL EDUCATION IN VIENNA. The Vienna School of Medicine, founded in the mid-19th cent., continued until World War I to hold a pre-eminent position among world medical schools.

FLORENCE NIGHTINGALE. *Notes on Nursing*, 1860, was published by Florence Nightingale (1820-1910) shortly after her return from nursing activities in the Crimea during the Crimean War. In the same year Miss Nightingale began to put her theories into practice when she became superintendent of the Nursing School at St. Thomas' Hospital in London. Training at this 1st modern nursing school consisted of a 1-year probationary period and 2 years' work as a member of the hospital staff. In 1873 a school following this model was begun at Bellevue Hospital in New York.

MEDICAL BIBLIOGRAPHY. John Shaw Billings (1838-1913), curator of the Army Medical Museum and Library in Washington, D.C., founded the *Index-Catalogue to the Library of the Surgeon-General's Office*, a massive attempt to compile a complete cumulative bibliography of medical literature. The vast amount of medical literature published

in recent years throughout the world (more than 5,000 medical journals appeared in 1960) made it impossible to keep the project up to date and it was abandoned in the mid-20th cent. Other indexes are available which catalogue articles from several thousand journals, but they make no effort to present a cumulative compilation.

REGISTRATION OF NURSES. Mrs Bedford Fenwick (1857-1947) established the British (later Royal) Nurses Association to promote government registration of nurses and standardization of their training in Britain, 1887. In 1901 New Zealand became the 1st state to require the registration of nurses, and shortly afterward the U.S. followed this example. In 1911 a Nurses Registration Act became effective in Britain, and in 1919 another Nurses Act established the General Nursing Council to maintain a register of nurses.

JOHNS HOPKINS MEDICAL SCHOOL. The opening of the Johns Hopkins Medical School, 1893, and Abraham Flexner's (1866-1959) report, *Medical Education in the United States and Canada*, 1910, helped to upgrade the standards of American medical schools. Johns Hopkins required at least a year of undergraduate training in the natural sciences, and combined theoretical scientific education with bedside experience in its 4-year program. Flexner's report emphasized the need for adequate laboratories, frequent contact with patients, and skilled teaching staffs. Johns Hopkins became the model for medical schools throughout the country. However, the rising costs which implementing reform entailed reduced the number of American medical schools: 148 (1910), 76 (1932), 77 (1950), 83 (1962).

WORLD CONFERENCE ON MEDICAL EDUCATION. In 1953 the 1st World Conference on Medical Education was held in London. 600 delegates representing 59 nations considered the problems of undergraduate medical training. Further training to follow graduation from medical school was the main topic of a 2nd conference held in Chicago, 1959.

BIRTH CONTROL

CONTRACEPTION. Jeremy Bentham's recommendations in favor of birth control, 1797, were received without enthusiasm in Britain; but when Francis Place (1771-1854) suggested, 1822, in *Illustrations and Proofs of the Principle of Population*, that contraception might be considered preferable to late marriage as a means of curbing reproduction, his ideas met with a more favorable response.

FAMILY PLANNING. In 1912 a Socialist newspaper, *The Call*, published Margaret Sanger's articles "What Every Woman Should Know," and "What Every Girl Should Know," urging contraception as a means of emancipating women from unlimited childbearing. In 1914 Mrs. Sanger published information about contraception in a pamphlet, *Family Limitation*, and in 1910 she opened the 1st birth-control clinic in the U.S. in Brooklyn, N.Y. Similar clinics opened in other U.S. cities and these formed the National Birth Control League in 1917 and the Planned Parenthood Federation of America in 1942.

Marie Stopes initiated the birth-control movement in Britain, and the 1st clinic opened there in 1921. Sweden, which in the 1930's established tax-supported municipal clinics, was the 1st country to give public assistance to birth control. In other countries family limitation assistance includes legalization of abortion and contraception in Japan, 1948, government support to birth-control campaigns in India, 1950's; re-establishment of "abortion on request" in the USSR, 1955; and support for family planning in Chile, 1963, the 1st predominantly Roman Catholic country to do so.

THE PILL. The U.S. Food and Drug Administration approved the 1st oral contraceptive, 1960, following 5 years of field tests in Puerto Rico, Haiti, Los Angeles, San Antonio, and New York. "The Pill," which was developed during the 1950's by Gregory Pincus, M. C. Chang, and John Rock, has been declared

effective in preventing pregnancy if taken according to prescription.

PAPAL ENCYCLICAL. Oral contraceptives, however, were condemned by Pope Paul VI in his encyclical *Humanae vitae*, 29 July, 1967, together with other forms of artificial contraception. The rhythm method, sanctioned by Pope Pius XI (encyclical *Casti connubii*, 1930), remained the only method of contraception approved by the Roman Catholic Church.

PUBLIC-HEALTH LEGISLATION

1ST HEALTH-INSURANCE SCHEME.

In 1757 the British Parliament approved an act "for the relief of coal heavers working upon the River Thames." The act required employers to make deductions from the coal heavers' wages. The money was then paid into a common fund from which sick, invalid, and aged workers received benefits. Employer fraud forced the act to be abandoned, 1770, but the system was reinstated, 1792.

SLUM CLEARANCE. The decade of the 1760's saw the 1st attempt at slum clearance in London. Wooden buildings were replaced by brick, and the streets were paved, lighted, and drained in some areas.

GOVERNMENT RESPONSIBILITY FOR HEALTH. Johann Peter Frank (1745-1821) published *A Complete System of Medical Polity* in 1779. Frank, who practiced medicine in 10 different cities in Germany, Austria, and Russia, and served as head of the General Hospital in Vienna, was the 1st to suggest that a government should be responsible for the health of its citizens. Far in advance of his time, he urged international regulation of health and the establishment of national authorities to coordinate efforts to improve hygiene and sanitation.

1ST FEDERAL HEALTH PROGRAM IN U.S. In 1798 Congress adopted a plan for the insurance by the state of disabled seamen. The scheme was to be financed by a 20% deduction from mariner's wages.

CHILD LABOR. The British Health and Morals of Apprentices Act, 1802, limited child workers to a 12-hr. day. Although the act was largely ineffective, its approval by Parliament made the British government the 1st to recognize its responsibility for industrial conditions and awakened interest in child-labor reforms in other countries. The Factory Act of 1819 prohibited the employment of children under 9 in British cotton mills, and limited children under 16 working in the industry to a 12-hr. workday. The Factory Act of 1833 forbade the employment of children under 9 in all British textile mills, and restricted those under 13 to an 8-hr. workday and those between 13 and 18 to 12 hrs. Even more important, the act provided for the appointment of 4 factory inspectors to enforce these regulations and made 2 hrs. of schooling each weekday mandatory for all children between the ages of 9 and 13 working in factories.

In the U.S. the 1st child-labor law was enacted in Massachusetts, 1812. Six yrs. later Pennsylvania prohibited children under 12 from working in certain mills and limited their workday to 10 hrs. in other industries. However, loopholes in the act and the mild punishment prescribed for violators rendered this legislation ineffective.

PUBLIC SANITATION. In 1842 Edwin Chadwick (1800-1890) published *Report of an Inquiry into the Sanitary Conditions of the Labouring Population of Great Britain*. Chadwick, who advanced the "sanitary idea" by focusing concern on preventive group measures rather than the cure of individual instances of disease, is often regarded as the founder of modern public-health systems. His report recognized the correlation between poverty and illness, and his recommendations favoring such innovations as daily refuse removal, abolition of cesspools, and a radical redesign of sewers were later adopted.

FEMALE LABOR. In Britain the Mines and Collieries Act, 1842, forbade underground work by women and young children. In 1845 these prohibitions were

extended to print shops, in 1860 to bleaching and dyeing works, in 1861 to lace factories, and in 1864, 1867, 1871, and 1878 to many other hazardous industries.

BRITISH PUBLIC HEALTH ACT. 1848. A milestone in public-health legislation, this act established locally elected health boards, each of which appointed a medically trained health officer and created a sanitary code to serve as the standard for remedying sanitation defects. Although the reforms inaugurated were short-lived, the act laid the basis for further public-health legislation.

U.S. BOARDS OF HEALTH. The report of the Massachusetts Sanitary Commission, 1850, by Lemuel Shattuck (1793-1859) recommended the establishment of a state board of health. The *Systematic Treatise*, 1850, by the Ohio physician, Daniel Drake (1785-1852), urged the same reform. However, Massachusetts did not institute such a board until 1869. Most other state and municipal governments took similar action during the 1870's and 1880's, though Texas waited until 1909.

BRITISH FOOD AND DRUGS ACT. 1872. The Adulteration of Food and Drugs Act required inspection and analyses of most foodstuffs and levied a fine of £250 for the 1st violation and 6 mos. imprisonment at hard labor for 2nd offenders.

BRITISH PUBLIC HEALTH ACT. 1875. This act contained a complete sanitary code which, following necessary adjustments and additions, is still in operation in the U.K.

POLLUTION. The Chicago City Council adopted the 1st smoke ordinance in the U.S. in 1881. In 1912 the 1st federal water-pollution studies were undertaken by the Public Health Service.

In the 20th cent. the increasing danger of air pollution was emphasized by numerous disasters: in the Meuse Valley in Belgium, 1-5 Dec., 1930, contaminants emanating from steel mills, power plants, glassworks, lime kilns, a zinc factory, a sulphuric-acid factory, and a fertilizer plant, all located within a 15-mi. area,

caused, in exceptional atmospheric conditions, over 60 deaths. A meteorological inversion and stagnation over Donora, Pa., U.S., on 27-31 Oct., 1948, resulted in 20 fatalities and 6,000 reported illnesses. On 24 Nov., 1950, a malfunctioning sulphur removal unit at a petroleum refinery in Poza Rica, Mexico, vented large quantities of hydrogen sulphide into the air, killing 22 and hospitalizing 320. A temperature inversion in London, 5-9 Dec., 1952, was responsible for an increase in the death rate by 3,500 during the immediately ensuing months.

COMPULSORY SICKNESS INSURANCE. The 1st compulsory health insurance scheme was originated, 1883, by Otto von Bismarck in Germany. Bismarck's plan provided for free treatment, free medicine, and a cash allowance for industrial and certain other manual workers. It departed from common-law doctrine, since proof of employer negligence was not required before a worker received these benefits. Similar schemes were adopted in Austria, 1888, Hungary, 1891, Luxembourg, 1901, and Norway, 1909. The German plan also served as a model for the British Workmen's Compensation Act of 1907 and for the workmen's compensation laws approved by every state in the U.S. between 1902 and 1948.

U.S. PURE FOOD AND DRUG ACT. 1906. By this act Congress prohibited the manufacture, transportation, or sale of adulterated food. The legislation had minimal effect, however, since the courts narrowly defined "adulteration," and the "distinctive name" exemption was a wide loophole which permitted the sale of virtually anything provided its manufacturer gave it a "distinctive name."

HEALTH EDUCATION. After World War I, health education became a major preoccupation of many governments. The USSR established a department of health education within the Commissariat of Health, the U.S. set up a similar division within the Public Health Service, and the British founded a Central Council for Health Education. Public-health activity, including education, began in India shortly after the Government of

India Act of 1919 placed health administration under the jurisdiction of the provinces.

U.S. SOCIAL SECURITY ACT. 1935. This act included health provisions, such as maternal and child health care, aid to crippled children, child-welfare services, vocational rehabilitation, and assistance to state public-health programs. The plan was financed by equal contributions by employers and employees.

'NEW ZEALAND SOCIAL SECURITY ACT. 1938. This New Zealand Act provided completely state-supported hospital and medical care for the entire population. A tax of 1s. 6d. in the pound was approved to pay for the medical attention and other social benefits provided by the act.

U.S. FOOD, DRUG, AND COSMETIC ACT. 1938. Following the deaths of 73 persons who had taken a poisonous drug, elixir sulfanilimide (the Pure Food and Drug Act of 1906 did not prohibit the distribution of poisonous drugs), this act eliminated major loopholes in the earlier legislation.

BRITISH DISABLED PERSONS EMPLOYMENT ACT. 1944. The basis of vocational rehabilitation in Britain, the act provided for employment of the disabled—to be arranged by resettlement officers in the Ministry of Labour—and established the quota of disabled workers each employer was required to engage. Austria, France, Germany, Greece, and Israel, among other countries, adopted similar "quota" arrangements. In the USSR the handicapped are retrained by the Ministry of Social Welfare and employers are required to provide them with suitable work.

BRITISH NATIONAL INSURANCE ACT. 1946. The act insured employees against accidental personal injury and industrial disease arising from their particular employment. Coverage under the act became compulsory; previously, benefit plans had depended on the payment of workmen's compensation insurance.

BRITISH NATIONAL HEALTH SERVICE ACT. 1946. This act provided complete medical care for the entire population of England and Wales. The

government had 1st guaranteed sickness benefits to workers in 1911, when the National Insurance Act had been passed. This early act provided treatment, drugs, and cash allowances for nonmanual workers earning less than £160 per year and for all manual laborers. Financed by levies on employers and employees in addition to contributions from the state, it benefited 16 m. workers. The 1946 act fully socialized medicine in England and Wales. Financed by a flat-rate system of payment, the National Health Service was organized to provide medical service for all. Each citizen was to select the doctor by whom he wished to be treated, and the government contracted to pay the doctor a fee for each patient on his list. In 1947 the act was extended to Scotland.

U.S. NATIONAL MENTAL HEALTH ACT. 1946. The Congress approved funds to finance research and training programs and to aid the states in founding community mental-health centers.

CANCER AND CIGARETTE SMOKING. In 1953 Anton Ochsner (b. 1896) in the U.S. released a study showing that cigarette smoking was responsible for an increased incidence of lung cancer. His findings were confirmed by a British government study and by a report by the American Cancer Society, 1954. In 1964 the surgeon general of the U.S. reported that "cigarette smoking is a health hazard of sufficient importance to warrant remedial actions." In response to this, Congress, 1964, approved the Federal Cigarette Labeling and Advertising Act which required the warning "Caution: Cigarette Smoking May Be Hazardous to Your Health" to be printed on all cigarette packages sold in the U.S. after 1 Jan., 1966. Several European countries have since adopted similar measures.

CANADIAN HOSPITAL INSURANCE ACT. 1958. The Canadian government, by the Hospital Insurance and Diagnostic Services Act of 1958, undertook to provide grants-in-aid to the individual provinces, which in turn were to provide unlimited hospitalization in ward beds and hospital outpatient diagnostic services.

BRITISH MENTAL HEALTH ACT, 1959. Passed by Parliament in an effort to eliminate legal and social distinctions between mental and physical illness and to provide care for sick persons not requiring institutionalization, the act made it possible for any mental patient to be treated on an informal basis. Hospitalized patients might have their cases regularly reviewed to determine whether further residential care was necessary. Before this the Mental Treatment Act of 1930, which had relaxed the provisions of the Lunacy Act of 1890 that had made all hospitalized mental patients subject to compulsion, regulated the care of the mentally ill in Britain.

MEDICARE. A Medicare Bill was approved by the U.S. Congress in 1965. Hospitalization benefits under Medicare provide up to 90 days of hospital care to the aged for each spell of illness, with the patient paying the 1st \$40 of his hospital expenses and \$10 a day after the 1st 60 days. Part of the plan, which became effective in 1967, also pays for up to 100 days of nursing-home care following 3 or more days of hospitalization, and provides up to 100 different medical services (e.g., home nursing) after discharge from a hospital or nursing home. Other benefits include outpatient diagnostic services, with the patient paying the 1st \$20 and 20% of the costs from the same hospital during a 20-day period, and a lifetime limit of 190 days of inpatient psychiatric care. This part of the plan is financed by compulsory taxes on earnings, which began in 1966 at $\frac{7}{10}$ of 1% (half paid by the employer and half by the employee) and are scheduled to rise to 1.6% by 1987. A voluntary supplementary plan is also available to individuals 65 or older. Under this option each subscriber pays a \$3 monthly fee which is matched by an equal contribution from the federal government. In return, after the patient pays the first \$50 of his annual medical expenses, the federal government assumes responsibility for 80% of the fees resulting from physicians' and surgeons' care, up to 100 home health services (without previous hospitalization), lab tests, surgical dressings, etc. Outpatient psychiatric

services are limited to \$250 or 50% of the expenses, whichever is smaller.

INTERNATIONAL REGULATION OF HEALTH

NEUTRALITY OF MILITARY HOSPITALS. Sir John Pringle (1707-82) recommended in *Observations on the Disease of the Army*, 1752, that the military hospitals of both protagonists during the Battle of Dettingen, 1743, should have been regarded as sanctuaries. His suggestion foreshadowed the plan adopted at the 1st meeting of the Red Cross, 1863.

INTERNATIONAL SANITARY CONFERENCES. The 1st International Sanitary Conference, 1851, marked the beginning of worldwide control of public health. Representatives from Austria, France, Greece, the Papal States, Portugal, Sardinia, Russia, the 2 Sicilies, Spain, the Ottoman Empire, Tuscany, and Britain gathered in Paris to establish minimum quarantine regulations in the wake of the great cholera epidemics then sweeping Europe. Similar conferences met regularly thereafter to ease barriers to trade and protect Europe against exotic pestilences. But not until the 13th International Sanitary Conference, 1903, was sufficient information on cause and control available for adequate plans to be made to cope effectively with the 3 principal epidemic diseases of the time: cholera, plague, and yellow fever.

RED CROSS. Influenced by the widespread suffering of the French, Italian, and Austrian troops during the Battle of Solferino, Jean Henri Dunant (1828-1910) published *A Memory of Solferino*, 1862. His suggestion that a relief organization be founded in peacetime that would be available to aid the wounded in time of war led to the establishment of a committee, 1863, which later became the International Committee of the Red Cross. The 1st national Red Cross societies were founded, 1864, in Belgium, France, Italy, and Spain; by the mid-1960's more than 100 national organizations existed. Originally designed to help victims of war, the Red Cross since the

end of World War I has expanded its operations to include peacetime activities such as assistance to the victims of natural disasters.

PAN-AMERICAN SANITARY BUREAU. This bureau, with headquarters in Washington, D.C., was founded, 1902, to work toward the eradication of yellow fever.

BERN CONFERENCES. Conferences held at Bern, Switzerland, in 1905, 1906, and 1913 led to international conventions outlawing the use of white phosphorus in matches, employment of women and children under 16 at night, and stipulating hours of labor for such workers.

DRUG FORMULAE STANDARDIZATION. In 1906 the 1st international agreement was signed for the "Unification of the Formulae of Potent Drugs."

DISSEMINATION OF PUBLIC-HEALTH INFORMATION. In 1909 the Office International d'Hygiène Publique was founded with headquarters in Paris to disseminate public-health information, especially data on communicable diseases.

NARCOTICS CONTROL. The 1st international conference on narcotics control met in Shanghai, 1909. The Hague Opium Convention, 1912, required international control of the production, importation, and export of raw opium and coca leaves and domestic regulation of their manufacture, distribution, and use. These objectives were included in the 1919-20 peace treaty and were upheld by the League of Nations. The Geneva Convention, 1925, attempted to establish an opium production quota system and entrusted the Health Committee of the League with the task of determining which narcotics should be placed under international control.

SOVIET LABOR CODE. 1922. The labor code of the USSR, 1922, theoretically included a comprehensive social-service and medical-aid program financed by heavy taxes levied on employing agencies. Although the constitution of 1936 reaffirmed this plan, it did not go into actual operation until after World War II. Health care in the USSR is standardized, and most services are provided by polyclinics, health centers em-

ploying general practitioners, specialists, and public-health experts. 70,000 village and street committees are responsible for sanitary matters and medical care within their individual jurisdictions.

LEAGUE HEALTH ORGANIZATION. In 1923 the Permanent Health Organization of the League of Nations was created, with headquarters in Geneva.

BRUSSELS AGREEMENT. 1924. This agreement introduced free medical care for seamen in major world seaports. It was part of an attempt to prevent the spread of contagious disease and was carried out under the auspices of the Office International d'Hygiène Publique, the League of Nations, the League of Red Cross Societies, the International Union against Venereal Disease and the Treponematoses, and the Belgian government.

INTERNATIONAL SANITARY CONVENTION. 1926. This agreement added smallpox and typhus to the list of quarantinable diseases (the others were malaria, plague, and yellow fever) and made the Office International d'Hygiène Publique a clearinghouse for data on epidemics throughout the world.

INTERNATIONAL PHARMACOPOEIA. In 1929 an international agreement provided for the compilation of an international pharmacopoeia. It was signed by 26 nations.

UNICEF. In 1946 the United Nations International Children's Emergency Fund (UNICEF—after 1953 the UN Children's Fund) was established to aid children in countries devastated by World War II and to promote child health throughout the world after the emergency conditions of the postwar era had passed.

NARCOTICS PROTOCOL OF 1946. This agreement placed all prior narcotics control instruments under the supervision of the UN and replaced the Opium Advisory Committee of the League of Nations by the UN Commission on Narcotic Drugs. A further protocol, 1948, provided the means whereby new drugs might be added to the controlled categories. By 1953 more than 50 nations had agreed to drastic limitations on opium production, and the Single Convention of 1961 codi-

fied the provisions of numerous multilateral treaties.

WORLD MEDICAL ASSOCIATION. The World Medical Association for the promotion of closer ties among national medical organizations was established in 1947.

WORLD HEALTH ORGANIZATION. In 1948 the World Health Organization (WHO) was established with headquarters in Geneva. The organization aims to provide the highest possible level of health for all peoples and to increase international co-operation for improved health conditions. A specialized agency of the UN, WHO absorbed the League of Nations Health Organization and the

Office International d'Hygiène Publique, but the Pan-American Sanitary Bureau continues to function both as an independent organization and as WHO's regional office in the Western Hemisphere.

INTERNATIONAL SANITARY REGULATIONS. 1951. These regulations were drawn up by the World Health Assembly and replaced a multiplicity of earlier international health conventions. They stipulate the sanitary standards and measures to be enforced against contagious diseases at seaports and airports open to international traffic, and include provisions for sanitary documents such as vaccination and other health certifications.

THOUGHT AND CULTURE IN AN AGE OF REVOLUTION

Religion and Philosophy

RELIGION

Roman Catholicism

18TH-CENT. DECLINE IN THE CHURCH'S POWER. Deism, which spread from England to France in the 18th cent., became an important element in antichurch ideologies. While the deists and the *philosophes* attacked the religious doctrines of the church, Febronianism,^a Gallicanism, and Josephinism sought to limit the authority of the pope and give the church a local character. Agitation by these groups led to the expulsion of the Jesuits from Portugal, 1759, from France, 1764, and from Spain, Naples, and Parma, 1767. Bowing to diplomatic pressure, Pope Clement XIV (reigned 1769-74) dissolved the Society of Jesus, 9 June, 1773. With the onset of the French Revolution further attempts were made to limit the church's power. The Civil Constitution of the Clergy, 12 July, 1790, sought to reorganize the French Catholic Church, but resulted in a schism. The papal bull *Caritas*, 13 Apr., 1791, condemned the innovations. Persecution of the church in France continued until the Concordat of 10 Apr., 1802.

19TH-CENT. REVIVAL. After the collapse of the Napoleonic Empire, the church began to reassert its power in Europe as well as benefit from a revival of belief. In reaction to the Enlightenment, spokesmen for Ultramontanism such as Joseph de Maistre (1753-1821) and Félicité de Lamennais (1782-1854) em-

phasized the infallibility of the church. The 18th-cent. pattern of church-state conflict was replaced by papal concordats with Sardinia and Bavaria, 1817, Naples, 1818, and the Netherlands, 1827. The French concordat was revised, 1819, while special arrangements were worked out with Prussia, 1821, and later with other German states. The revival of faith led to the establishment of a number of new orders. The Society of Jesus was revived, 1814, while missionary orders were established, such as the Oblates of the Blessed Virgin Mary Immaculate, 1816, the Marists, 1817, the Lyons Society of African Missions, 1856, the Fathers of the Holy Spirit, 1848, and the White Fathers, 1868.

CHALLENGE OF LIBERALISM. The revival of faith continued throughout the 19th cent., but the church felt itself threatened by the re-emergence of nationalism and by the development of liberal doctrines which challenged it in matters of marriage, education, and authority. Pius VIII (reigned 1829-30) issued the encyclical *Traditi humilitati nostrae*, 24 May, 1829, to promote Christian education, maintain marriage laws, and oppose secret societies. During the pontificate of Gregory XVI (reigned 1831-46) a number of other encyclicals were issued to counter the wave of liberalism both in the church and in society. Of these *Mirari vos*, 15 Aug., 1832, which denounced the program of the Liberal Catholics, was the most important.

PAPAL INFALLIBILITY. The reign of Pius IX (1846-78) was initially seen

as liberal but, following the upheavals of 1848-50, Pius joined the counterrevolution against liberalism and nationalism. He strengthened his hold on the church when he declared the Immaculate Conception of the Blessed Virgin Mary to be dogma, 8 Dec., 1854. This was the 1st time a dogma of the church had been promulgated without consulting a council, and thus served as a demonstration of the pope's authority within the church. In the *Syllabus of Errors*, which was appended to the encyclical *Quanto cura*, 8 Dec., 1864, and in a number of other declarations Pius IX detailed the church's stance against liberalism. The church hierarchy, which was fully under ultramontane control, concurred with Pius' actions, and during Vatican Council I, 8 Dec., 1869-1 Sept., 1870, defined the dogma of the infallibility of the pope while speaking *ex cathedra* on questions of faith or morals, 18 July, 1870.

DEFEAT OF LIBERALISM. The growing conservatism of the pope and the church hierarchy led to the division of the church, 1st in France and then elsewhere, into Liberal and ultramontane factions. In Germany the Liberal Munich school of theology led by Johannes von Dollinger (1799-1890) was challenged by the Mainz school. In England, Dollinger's disciple Lord Acton (1834-1902) and Richard Simpson (1820-76) faced increasing opposition from the hierarchy, while John Henry Cardinal Newman (1801-90), the leader of the Anglican converts, was regarded with great suspicion. By the end of Pius' reign the Liberal movement had been overcome, and papal authority in spiritual matters secured. The temporal power of the church was cut short, however, by the occupation of Rome by Italian forces, 20 Sept., 1870. The conservatism of the national churches was an important factor in the major church-state conflicts in Germany (*Kulturkampf*), 1871-90; in France, 1879-1914; and in Mexico, 1913-37.

THE CHURCH AND MODERN SOCIETY. Under Leo XIII (reigned 1878-1903) the church began a gradual adjustment to modern society. His encyclical *Aeterni patris*, 4 Aug., 1879, which established Thomism at the center of Catholic

theology, was a step toward improving the education of the clergy. Building upon the teachings of Cardinal Manning (1808-92) of England and Bishop Ketteler (1811-77) of Germany, Leo directed the church toward a Catholic response to the problems of industrial society. The encyclical *Rerum novarum*, 15 May, 1891, announced the church's support of social justice, while the ideas of Christian democracy were given limited support in *Graves de communi re*, 18 Jan., 1901. Pius X (reigned 1903-14) amplified Leo's social doctrines and affirmed the ideas of Catholic Action under church control. Catholic Action was given its greatest impetus by the encyclical *Ubi Arcano Dei*, 23 Dec., 1922, issued by Pius XI (reigned 1922-39). In *Quadragesimo anno*, the 2nd of the great social encyclicals, 15 May, 1931, Pius XI pressed for the implementation of social reforms. This stance was taken up by subsequent popes, and in *Mater et Magistra*, 14 July, 1961, John XXIII (reigned 1958-63) brought the church's social doctrines up to date.

MODERNISM AND AFTER. Attempts to reconcile the teachings of the church with the findings of science led, in the 1890's, to the formation of a modernist movement. Alfred Loisy (1857-1910) challenged the doctrine of the inerrancy of the Bible, while a number of other French Catholics, looking to the church in America as a model, proclaimed the need for a free church in a free state. Despite Leo's attack on the modernists in the encyclical *Providentissimus Deus*, 18 Nov., 1893, and the establishment of the Pontifical Biblical Commission to supervise Catholic biblical studies, 1902, the movement flourished in Catholic intellectual circles. The definitive condemnation of modernism came in 1907 with the decree *Lamentabili san exitu*, 3 July, and the encyclical *Pascendi dominici gregis*, 8 Sept. A number of modernist leaders were excommunicated, and the movement was crushed by 1910.

Subsequent orthodox Catholic theology has followed along the path laid down by Leo XIII. The dogma of the Assumption of the Blessed Virgin Mary was set forth by Pius XII in *Munificentissimu Deus*, 1 Nov., 1950. The main current of

theology has been Neo-Thomism, of which Jacques Maritain (b. 1882) and Étienne Gilson (b. 1884) are the leading exponents. Cardinal Augustin Bea (1881–1968) has been influential in broadening the permissible scope of scriptural interpretation. Attempts to formulate a "new theology" incorporating evolutionism, existentialism, 'and historicism were condemned, however, by Pius XII in the encyclical *Humani generis*, 12 Aug., 1950. Many of the writings of Pierre Teilhard de Chardin (1881–1955), which outlined a metaphysics of evolution, were banned from publication during his lifetime, but are now making an impact upon Catholic theology. John XXIII gave impetus to the ecumenical movement and summoned Vatican Council II, 11 Oct., 1962–8 Dec., 1965. Hans Küng (b. 1928), who has sought to reconcile Barth (p. 976 below) and Catholic theology on the doctrine of justification, was appointed official theologian of the Council. The Council evoked a number of liturgical innovations, and established the principle of collegiality, by which the pope shares power with the bishops of the church. With the publication, however, of the encyclical *Humanae vitae*, 29 July, 1968, which condemned all methods of artificial contraception, Pope Paul VI, whose reign began in 1963, may have set aside this principle.

Protestantism

EVANGELICALISM. The decisive moment in the rise of evangelicalism from its 16th-cent. pietistic origins was the beginning of the Methodist movement in England. Based on the teachings of John (1703–91) and Charles (1707–88) Wesley and George Whitefield (1714–70), the movement did not separate from the Anglican Church until American Methodists demanded their own clergy following the American Revolution. Presbyters were ordained by John Wesley for the American Church in 1784, and later for Scotland and England. Between 1795 and 1836 the separation from the Church of England was completed. Conflicts over leadership and methods led to secessions: the Methodist New Connection, 1797, the

Primitive Methodists, 1812, and the Bible Christians, 1818. Evangelical techniques spread to the Baptists and Congregationalists, who experienced revivals, as well as to the Church of England, where evangelicalism became the decisive force in the early 19th cent. Isaac Milner (1750–1820) and Charles Simeon (1759–1836) were the early religious leaders of the movement, and the Clapham Sect its philanthropic arm.

MISSIONS. Evangelicalism also gave impetus to new missionary societies. The Baptist Missionary Society, founded 1792, the London Missionary Society, 1795, the Church Missionary Society, 1799, the British and Foreign Bible Society, 1804, and the Methodist Missionary Society, 1813, were the main English movements. On the Continent, the Basel Mission was established in 1815, the Berlin and Paris Missionary Societies 1821, the Rhenish Missionary Society 1828, the Swedish Society 1835, Leipzig Society 1836, Bremen Society 1836, and the Norwegian Society 1842.

NORTH AMERICAN PROTESTANTISM. In North America the evangelical movement aided in the rapid growth of Baptist and Methodist denominations. It also gave birth to a number of benevolent and missionary societies, such as the American Board of Commissioners for Foreign Missions, 1810, the American Education Society, 1815, the American Bible Society, 1816, and the American Sunday School Union, 1824. The repeated evangelical revivals of the 19th cent. gave rise to a large number of sects. The Adventists were one offshoot that arose in response to the millennial prophecies of William Miller (1782–1849). The 7th-Day Adventist Church established by Ellen G. White (1827–1915) stemmed from Miller's preaching, as did the Church of Jesus Christ of Latter-Day Saints (Mormons) founded by Joseph Smith (1805–44) in 1830. However, after its movement to Utah in 1847 under the leadership of Brigham Young (1801–77), the Mormon Church diminished the adventist emphasis. The Jehovah's Witnesses were established as the Watch Tower Bible and Tract Society, 1879, by Charles Taze

Russell (1852-1916). The Christian Science Church, established in 1879 by Mary Baker Eddy (1821-1910), was a sect which based itself upon special knowledge and prayer healing. A revulsion from Calvinistic orthodoxy led to the foundation of the American Unitarian Movement, 1825, while the Universalists were established as a separate denomination in 1833.

ROMANTICISM AND ITS RESPONSES. The 19th-cent. reaction to the Enlightenment gave birth to romanticism, which in religious thought led to an emphasis upon the nonrational aspects of the human mind. The main figures of the romantic philosophy of religion were Immanuel Kant (1724-1804), Georg Hegel (1770-1831), and Hegel's opponent Friedrich Schleiermacher (1768-1834). Outside Germany the movement had its greatest impact in American transcendentalism. Within Germany it gave birth to a number of diverse responses. Lutheran orthodoxy denied the tenets of the romantic school, and instead revived confessionalism, which stressed doctrine, the sacraments, and church discipline. Its main spokesmen were Ernst Wilhelm Hengstenberg (1802-69) and Gottlieb von Harless (1806-79). Ferdinand Christian Bauer (1792-1860), the main figure of the Tübingen school, moved away from the speculation of Hegelianism to a closer analysis of the New Testament. Bauer stimulated the development of Biblical criticism, which flourished in the late 19th cent. David Friedrich Strauss (1808-74) and Ernest Renan (1823-92) were among the leading figures in the attempt to reconstruct the life of Jesus, as was Albrecht Ritschl (1822-89), who rejected the association of Christianity with any form of metaphysics, and the church historian Adolf von Harnack (1851-1930). With the publication of *The Quest of the Historical Jesus*, 1906, by Albert Schweitzer (1875-1965) the 19th-cent. delineation of Christ in ethical terms was replaced by one in theological terms.

THE OXFORD MOVEMENT. Following the passage of the Irish Church Act of 1833, the Oxford movement arose in England to assert the independent authority of the clergy as the successors of

the apostles. The movement was led by John Keble (1792-1866); Edward B. Pusey (1800-82), the most famous of the English Tractarians; and John Henry Newman (1801-90). When Newman left the movement in 1845 to join the Roman Catholic Church, where he became the central figure in the revival of English Catholicism, the Oxford movement went into decline.

THE DEVELOPMENT OF A SOCIAL GOSPEL. Anglicans under the leadership of John Malcolm Ludlow (1821-1911) and Frederick Denison Maurice (1805-72) were among the 1st to respond to the conditions of industrial society. Their movement, Christian Socialism, flourished between 1848 and 1854. The Anglican Church took up the challenges of industrial society with the organization of the Guild of St. Matthew, 1877, and the Christian Social Union, 1889. The Y.M.C.A. was founded by George Williams (1821-1905) in 1844, while the Y.W.C.A. had its beginnings in 1855. Both organizations sought to combine religious and social objectives. English and American nonconformists were deeply involved in the temperance movement, and also in the efforts to reach the urban poor through the Salvation Army, organized in 1878 by William Booth (1829-1912), and the Volunteers of America, established by Booth's son Ballington (1859-1940) in 1896. In Germany the writings of Albrecht Ritschl, one of the founders of modern Liberal Protestantism, helped to provide a theological basis for the social gospel. The inspiration for a Christian social movement came, however, from leaders of the Inner Mission, such as Johann H. Wichern (1808-81) and Adolf Stöcker (1835-1909), and in the U.S. from such figures as Walter Rauschenbusch (1861-1918).

SCIENCE AND RELIGION. While Biblical criticism provided the internal challenge to Protestantism, science provided the external one. After the publication of Charles Darwin's *Origin of Species*, 1859, the literal interpretation of Genesis was undermined. Anthropological studies of primitive societies challenged the concept of the universality of

the moral code, while the rise of "social Darwinism" alienated large numbers of intellectuals from organized religion. Liberal theology attempted to accommodate the new doctrines of science, while American fundamentalism, which arrived at its views at a Bible conference at Niagara in 1895, rejected them.

THE RISE OF REFORMED CHURCHES. The conflict between church leadership, supported by the state, and evangelicalism led to a number of reformed Calvinist churches in the 19th cent. In Scotland about $\frac{1}{3}$ of the clergy and laity of the Scottish Kirk broke away to form the Free Church of Scotland under the leadership of Thomas Chalmers (1780-1847) in 1843. The Scottish churches were not reunited until 1929. A revival in Switzerland led to the breakup of several of the established canton churches: the Free Church of Vaud was organized in 1849, the Free Church of Geneva in 1849, and the Independent Evangelical Church of Neuchâtel in 1873. The repercussions of this movement had their greatest effect in France, where the Reformed Church was sharply divided throughout the 19th cent. Following the separation of church and state in 1905, the Reformed Church divided into 3 churches. In the Netherlands the established Dutch Church was split by a secession in 1834 which led to the formation of the Christian Reformed Church. Another group broke away in 1886 and joined the Christian Reformed Church in 1892.

THE THEOLOGY OF CRISIS. Liberal theology, which had dominated Protestant thought in the last half of the 19th cent., was shattered by World War I. Optimism gave way to a revival of the teachings of Søren Kierkegaard (1813-55), and the theology of crisis became the dominant form of 20th-cent. Protestant theology. Karl Barth (1886-1968), the founder of the movement, emphasized that man and his religion stood under the judgment of God (the *Krisis*), and that God was approachable only through faith. Emil Brunner (b. 1889) broke with Barth to formulate a more personalistic approach to Christ, while Rudolf Bult-

mann (b. 1884) combined crisis theology with Heidegger's system of existentialism; he also stressed the need to "demythologize" the Gospel in order to make it relate to the situation of modern man. Reinhold Niebuhr (b. 1892), who has become increasingly critical of Barth's approach, was a pioneer of neo-orthodoxy in the United States. Paul Tillich (1886-1965) moved away from Barth's emphasis upon Biblical theology to elaborate a form of philosophical theology.

THE ECUMENICAL MOVEMENT. Although the ecumenical movement had antecedents in the 19th cent.—the formation of the Evangelical Alliance, 1846, and the organization of the World's Student Christian Federation, 1895—the movement effectively dates from an International Missionary Conference held at Edinburgh in 1910. The movement was given impetus through the 1925 Universal Christian Conference on Life and Work organized by Nathan Söderblom (1866-1931) and the World Conference on Faith and Order of 1927. Missionary conferences held at Jerusalem, 1928, and at Tambaram, 1938, brought in many of the Asian and African churches. The Oxford Conference on Life and Work, which promoted the development of lay institutions, and the Edinburgh Conference on Faith and Order were held in 1937. They laid the groundwork for the World Council of Churches, which was established at Amsterdam on 23 Aug., 1948.

Eastern Orthodoxy

DECLINE OF THE ECUMENICAL PATRIARCHATE. Until the early 19th cent. the heads of the various Greek and Slavic Orthodox churches of the Balkans were selected by the ecumenical patriarch at Constantinople. As these nations won their independence from the Ottoman Empire, their churches asserted the right to elect their own primates and to be self-governing. The Greek Church was declared autocephalous in 1833, the Serbian Church in 1878, the Rumanian Church in 1885, and the Bulgarian Church in 1908.

RUSSIAN ORTHODOX CHURCH.

In the 19th cent. the Russian Orthodox Church underwent a spiritual and theological revival. A form of evangelical awakening was inspired by the *startsi* or elders, intense ascetics credited with the gift of healing. The most important of the *startsi* was St. Serafim of Sarov (1759–1833). In theology there was a return to the patristic traditions and a reaction against western thought. The main Slavophile thinkers were Alexei S. Khomiakov (1804–60), Feodor Dostoevski (1821–81), and Vladimir S. Soloviev (1853–1900). Under the influence of Soloviev's teachings, Nicholas Berdyaev (1874–1948) and Sergius Bulgakov (1871–1944) reacted against Marxism and pioneered a renovated Orthodox theology in the 20th cent.

The Holy Synod, which acted as the government of the church, became more closely bound to the czarist regime as the 19th cent. progressed. After the Bolsheviks gained power in 1917, the church, which was seen as a bulwark of the monarchy, was subjected to intense persecution, 1918–27. During World War II, however, the government permitted the election of a new patriarch (the post had been vacant since 1925), and the church entered an era of limited toleration.

Judaism

CABALISM AND HASIDISM. Cabalistic philosophy gave rise to mysticism and to a number of messianic movements in 18th-cent. Europe. The most important of these was led by Jacob Frank (1726–91) and his daughter Eve (d. 1817). The mystical teachings of Cabalism were absorbed into the doctrines of Israel ben Eliezer (known as the Baal Shem Tov, 1700–1760), the founder of Hasidism. Opposition to Hasidism centered around Elijah, the Gaon of Vilna (1720–97), and the Misnagdim (the "Opponents"). During the 19th cent. this schism within the East European Jewish community gradually healed.

REFORMISM. The Jewish Enlightenment began in Germany under the leadership of Moses Mendelssohn (1729–86).

The challenges to Jewish life brought about by the breakdown of the ghetto system and the final emancipation of the Jews (beginning in France, 27 Sept., 1791, and spreading to Prussia, 1812 and 1848, England, 1858, Austria-Hungary, 1867, Italy, 1870, and Russia, 1917) led to Reformism as well as assimilation (to the Gentile world) and Zionism. Napoleon aided the spread of Reform Judaism through his sponsorship of the Grand Sanhedrin, 9 Feb., 1807. The Reform movement centered initially on Germany, where the 1st Reform synagogue was established in 1810. Talmudic Judaism was undermined in the writings of Abraham Geiger (1810–74) and Samuel Holdheim (1806–60), while the Reform Society of Frankfurt, in its Declaration of 1818, rejected the doctrines of the Talmud. The aims and practices of the movement were elaborated in rabbinic conferences held in Brunswick, 1844, Frankfurt, 1845, and Breslau, 1846. Milder forms of Reform Judaism spread to Britain in 1840, to the U.S., where the reform movement dates from the arrival in 1846 of Isaac Mayer Wise, and to France in 1907. Attempts to unite Reform congregations resulted in the formation of the Union of American Hebrew Congregations, 10 July, 1873; the Central Conference of American Rabbis, 9 July, 1889, and the World Union for Progressive Judaism, 10 July, 1926.

COUNTERREFORM. Reform was unable to make headway against Orthodox Judaism in Eastern Europe, the Middle East, or Africa. The Union of Orthodox Jewish Congregations, founded 8 June, 1898, became the spokesman for Orthodoxy in the U.S., while the Agudath Israel was established, 8 May, 1912, to function as the international authority in matters of Orthodox law. Attempts to define a middle ground between Orthodoxy and Reform gave rise to the neo-Orthodoxy of Samson Raphael Hirsch (1808–88) in Germany, and to the Conservative Judaism of Solomon Schechter (1850–1915) in the U.S. The United Synagogues of America, founded 23 Feb., 1913, affiliated Conservative synagogues in

the U.S. and Canada. In 1922 Mordecai M. Kaplan (b. 1881) established the Reconstructionist movement in the U.S.

Islam

REFORMISM. The 1st Islamic reform movements were directed against the internal deterioration of the faith. The Wahabi (Wahhābi) movement, founded c. 1744 by Mohammed ibn-'Abd-al-Wahhab (Muḥammad 'Abd al-Wahhāb) (1703-87), rejected Sufism and demanded a return to early, puritanical Islam. The impact of Wahabi ideas led to the formation of the Faraidi sect under Shariat Allah (Shari'at Allāh), c. 1804, in India, but all other major Islamic reformers and movements have shown deep Sufi influence. In 1781 Ahmed al-Tijani (Ahmad al-Tijānī) (1737-1815) founded the Sufist Tijaniya (Tijāniyya) brotherhood, which became an important force in the western Sudan during the 19th cent. Shan Wali-yullah of Delhi (1703-81) emphasized reform Sufism and a revival of Indo-Moslem power.

Although the Sufi doctrine of union with God was rejected by Ahmad ibn Idris (1760-1837), the Idrisiyya movement which he founded, as well as the other missionary orders influenced by him, were organized along the lines of Sufi *tariqas* (*tariqas*). Of these movements the most important were the Saḥusiya (Sanūsiyya), founded in 1837 by Mohammed ibn Ali al-Sanusi (Muhammad ibn 'Alī al-Sanūsi) (1791-1851) in Cyrenaica, the Mirghaniyya of Mohammed Uthman al-Mirghani (Muhammad 'Uthmān al-Mirghani) (1793-1853), and the Rashidiyya of Ibrahim (Ibrāhīm) ar-Rashidi (d. 1874) in the Sudan and East Africa.

By the middle of the 19th cent. a new group of reformers were emerging who recognized that the West had to be confronted as well as Islam reformed in order for Moslem society to be fully regenerated. The main figure in the search for internal Islamic reform and defense from western penetration was Jamal al-Din al-Afghani (Jamāl al-Dīn al-Afghānī) (1839-97). Although his dream of Pan-Islam was not realized, his influ-

ence survived in popular movements which combined Islamic fundamentalism and activist politics. Afghani also influenced Mohammed Abduh (Muhammad 'Abduh) (1849-1905), the most important modern commentator on the Koran. Abduh, and also Sir Sayyid Ahmad Khan (Ahmad Khān) (1817-98), the founder of Aligarh College (India) in 1875, strove to accommodate western thought to Islam; they brought about a revaluation of traditional social ethics. Sir Mohammed (Muhammad) Iqbal (1876-1938) urged the incorporation of western learning and science as a means of resuming the heritage of Moslem civilization.

RISE OF NEW SECTS. In 1844 Sayyid Ali Mohammed ('Alī Muhammad) of Shiraz announced that he was the Bab ("gateway" to knowledge) and began a new sect, Babism. After his death, the majority of his disciples followed Bahau-lah (Baha 'ullah) (1817-92), who founded the Bahai (Baha'i) faith. Partially in reaction to the "Aligarh movement" the Ahmadiya (Ahmadiyya) sect arose, 1889, when Mirza Ghulam Ahmad (Ahmad), c. 1835-1908, received the 1st oaths of loyalty from his followers. Later he proclaimed himself the Mahdi and Messiah in India. The Ahmadiya split in 1914, the majority forming the Qadianis and the minority the Lahore Ahmadiya.

Hinduism, Buddhism, and Shinto

REFORM OF HINDUISM. The impact of the West on India in the 18th cent. led initially to a large number of conversions to Christianity. But by the 19th cent. contact with the West tended to revitalize Hinduism through the teachings of a number of reformers. In 1828 Raja Ram-mohan Roy (1774-1833) founded the Brahmo Samaj based on the unitarian doctrines of the Upanishads. Although almost extinct today, the Brahmo Samaj under the leadership of Roy, Devendranath Tagore (1817-1905), and the latter's son Rabindranath (1861-1941) campaigned successfully against certain aspects of Hinduism, such as suttee (abolished 4 Dec., 1829), child marriage, and polygamy. Keshab Chandra Sen (1828-84)

broke away from the Brahmo Samaj to teach a more Christian-oriented form of Hinduism in 1866. A return to the teachings of the Vedas was stressed in the Arya Samaj founded in 1875 by Dayananda Sarasvati (1824-83). Ramakrishna Paramahansa (1834-86) stressed the mystical aspects of Hinduism. His teachings inspired Swami Vivekananda (1863-1902) to found the Ramakrishna Mission in 1897. Yoga was popularized by Shri Aurobindo Ghose (1872-1950), who aided in its spread to Europe and the U.S. Mahatma Gandhi (1869-1948) renewed interest in the Bhagavad-Gita in his campaigns for political and social reform.

BUDDHISM. The 5th Great Council was held in Mandalay, Burma, in 1871, and the Pali text of the canon was inscribed on marble slabs. Between 17 May, 1954, and 23 May, 1956, the 6th Great Council met at Rangoon, Burma, where the Tipitaka was recited in Pali. Steps were also taken to translate it into several modern languages.

SHINTO. As one of the first acts of the Meiji Restoration, Emperor Mutsuhito (1852-1912) disestablished Ryōbu Shinto (a fusion of Buddhism and Shintoism) and established Shinto as the state religion of Japan on 30 Nov., 1868. On 15 Dec., 1945, the allied occupation government directed that Shinto be disestablished as the state religion.

PHILOSOPHY

German Idealism

At the end of the 18th and beginning of the 19th cents. a group of German philosophers, perhaps the most influential of modern times, took up and developed the philosophical system of idealism. Earlier expounded by George Berkeley (1685-1753), idealism was an assertion of the primacy of mind and of spiritual values over matter. It denied the existence of physical objects apart from man's perception and consciousness of them. Discontented with the Enlightenment philosophers' confidence in knowledge and science to explain all aspects of the world, Immanuel Kant and his followers

made use of the idealist argument to reject utilitarian explanations and to demonstrate that there were some things that could not be known by means of reason.

KANT. Immanuel Kant (1724-1804) was born in Königsberg in East Prussia, where he spent his entirely uneventful and regular life. He was greatly influenced by Leibniz, Hume, and Rousseau and admired Newton. His 1st work was scientific; he wrote a theory of earthquakes and of the winds, and published *General Natural History and Theory of the Heavens*, 1755. He considered the physical sciences to be the true realm of reason and, beginning c. 1780, began to point out the limits of reason in other fields. In his *Critique of Pure Reason*, 1781, he attacked metaphysics, claiming that there was no way of gaining knowledge of the supersensible world. Empirical evidence can never be employed to prove metaphysical concepts, such as the existence of God, freedom of the will, or the immortality of the soul. The nature of human experience remains uncertain, since the reality behind sense perception consists of unknowable "things-in-themselves." For Kant there were 2 distinct realms: sensations or phenomena, and reason. Our own mental apparatus orders sensations according to its intuition of space and time and by means of innate "categories." Thus we perceive a material world of objects existing in time and space, yet what we experience through our senses need not apply to the things-in-themselves, which are beyond the realm of experience (*Prolegomena to Any Future Metaphysics*, 1783). Kant thus demolished all intellectual proofs of the existence of God. Yet he found proof in the study of morals, which he called "practical reason" (*Critique of Practical Reason*, 1786). His argument ran as follows: since the moral law demands justice—i.e., happiness proportional to virtue—and since justice does not obtain for all in this life, then there must be a God and a future life. In the *Metaphysics of Morals*, 1785, he developed an ethical system, condemning actions—no matter how useful they might be—that were performed merely

out of self-interest. Moral actions are performed out of a sense of duty; Kant's "categorical imperative" prescribed that each man act in such a way that he can will his actions to become a law for all men.

FICHTE AND SCHELLING. Kant's disciple Johann Gottlieb Fichte (1762-1814) drew more radical consequences from the idealist philosophy. Abandoning the things-in-themselves, he considered that all of experience is derived from the activity of the ego (*Introduction to the Theory of Knowledge*, 1797). He is best known for his *Addresses to the German Nation*, 1807-8, which prompted the surge of German nationalism leading to the defeat of Napoleon. Friedrich Wilhelm von Schelling (1775-1854) was Fichte's disciple. He turned from early theorizing about the ego (*Vom Ich als Prinzip der Philosophie*, 1795) to a "philosophy of nature." He considered the natural world to be just as real and important as the ego (*Ideen zu einer Philosophie der Natur*, 1797). Yet he did not desert idealism, and in 1800 produced a Kantian system of knowledge (*System des transzendentalen Idealismus*).

HEGEL. The most influential of the German idealists was Georg Wilhelm Friedrich Hegel (1770-1831). With the intention of making philosophy scientific, he constructed a system explaining the history of the world and of the philosophies and institutions produced by man. He considered the history of the world to be an evolution toward ever greater perfection. It was the progressive realization of "spirit" (*Geist*) in man. In philosophy, this meant an ever nearer approach to truth; in history, an ever greater realization of human freedom (*Phenomenology of Mind*, 1807; *Philosophy of Right*, 1821; *Philosophy of History*, lectures c. 1830.) This evolution proceeded, according to Hegel, by a dialectical process: inadequate ideas, sharply contrasted with each other, were continually being synthesized into new and slightly better ones. This process would repeat itself until the state of perfection was reached. Hegel spoke of a "spirit of the times" (*Zeitgeist*) which

dominated each historical period. The prime movers of history were "world historical individuals."

MARX. During his lifetime, Hegel collected a great many disciples, among whom were conservatives as well as the radical "Young Hegelians." The most important of these latter was Karl Marx (1818-83), who based his revolutionary socialist theory largely on Hegelian precepts. (He was also influenced by French socialism and English classical economics.) Working with Friedrich Engels (1820-95), Marx accepted the evolutionary, dialectical view of history propounded by Hegel (*The German Ideology*, 1845-46). But he "stood Hegel on his head" by replacing "spirit" with matter (that is, economics) as the moving force in history ("dialectical materialism"). He saw the history of the world, not as the progression from one type of state to another (Hegel), but as a succession of modes of production—as the replacement of one class by another in the dominant role in society. The dialectical process would end only with the triumph of the working class and the end of private ownership of the means of production. Marx's aim was not merely to construct an abstract philosophical system explaining world history, but to use such a system in order to change the world.

REVIVALS OF IDEALISM. The influence of Kant and Hegel was often of a negative sort, eliciting violent attacks on their theories. But at the end of the 19th cent. there was a revival of idealism in England and in Italy. The group of neo-Hegelians at Oxford and in Scotland included Thomas Hill Green (1836-82), Francis Herbert Bradley (1846-1924), Bernard Bosanquet (1818-1923), and John Ellis McTaggart (1866-1925). In Italy, Benedetto Croce (1866-1952) expounded a "philosophy of the spirit."

Utilitarianism

Unlike the German idealists, the group of English philosophers known as utilitarians made no attempt to construct abstract philosophical systems. Rather, they formulated theories that they hoped

would lead to the betterment of mankind. They belonged to the "philosophical radicals," a group of liberal Whigs who hoped to produce reforms by combining philosophy, economics, and politics.

Jeremy Bentham (1748-1832) and James Mill (1773-1836) developed an empirical theory of ethics which was later refined and adapted to new conditions by Mill's son, John Stuart Mill (1806-73). The basic theory was formulated by Bentham in *Introduction to the Principles of Morals and Legislation*, 1789. Utilitarian morality was based on hedonism, the doctrine that pleasure is the chief good in life and pain the chief evil. Bentham defined happiness as the greatest amount of pleasure and of freedom from pain. The rightness of an action was to be judged by the contribution it made to human happiness and to the decrease of human misery. Laws and political institutions were to be judged according to the same criterion. Coercion by the state was allowable only when the action of individuals did not lead to the greatest good. James Mill used the utilitarian principle to defend representative institutions (article on "Government" in the 1820 *Encyclopaedia Britannica*). John Stuart Mill attempted to broaden Bentham's system without destroying its fundamental principles. He insisted that certain kinds of pleasures (i.e., those of the intellect) were more important than other kinds: therefore the *quantity* of pleasure it produced was not an adequate measure of the rightness of action (*Utilitarianism*, 1863). He contributed to the study of logic (*System of Logic*, 1843) and to liberal political theory as well (*On Liberty*, 1859).

Positivism

Auguste Comte (1798-1857) was educated as a scientist and was influenced by the French socialist Saint-Simon (1760-1825). His great respect for the precision and certainty of scientific knowledge led him to reject metaphysics as meaningless. His philosophy of positivism, based only on verifiable propositions, was meant to make philosophy scientific. In his *Course*

of Positive Philosophy, 1830-42, and *System of Positive Philosophy*, 1851-54, he expounded an evolutionary theory of the sciences. He named a new science, sociology, which would submit society and religion to empirical study. He propounded a "Law of 3 Stages" to explain the evolution toward perfection of each of the sciences. In the *theological* stage, men describe the world in terms of their knowledge of themselves, ascribing life to all they encounter. In the *metaphysical* stage, they abandon personalized agencies yet retain entities which are beyond experience. In the final *positive* (or scientific) stage, they finally learn to trust only the data of experience. At the end of his life, Comte attempted to develop a theory of ethics without metaphysical precepts. He suggested a Religion of Humanity, in which the best of human qualities would be worshiped.

Schopenhauer and Nietzsche

Arthur Schopenhauer (1788-1860) was influenced both by Kant and by the study of Oriental religions. In *The World as Will and Idea*, 1818, he described 2 ways of looking at the world, corresponding to Kant's 2 realms: the scientist studies the world in terms of *ideas* produced by experience, while the philosopher can get beyond appearances by studying the forces of *will* at work in the world. Schopenhauer believed in a World Will of which each individual, as well as inanimate things, partakes. He was a pessimist, believing that the will, always demanding and never satisfied, causes pain to predominate over pleasure in human experience. He described 2 ways of deliverance from unhappiness: the contemplation of eternal ideas or the conduct of a saintly life.

Friedrich Nietzsche (1844-1900) was the son of a Protestant pastor and reacted violently against the piety of his family. He was a brilliant student of classical philology and received a professorship at the University of Basel at the age of 24. He was influenced by Richard Wagner, with whom he quarreled, and by Schopenhauer. He became insane in 1889, just

as his philosophy began to gain recognition. He had great influence on literature and the arts as well as on philosophy.

Nietzsche's philosophy was developed from psychological speculation on morality and religion. His 2 volumes of aphorisms, *Human, All Too Human*, 1876–80, and *The Gay Science*, 1882, are full of psychological observations. He concluded that "the will to power" is the basic human drive. In *Thus Spoke Zarathustra*, 1883–84, he demonstrated this human drive to reach a higher, more powerful position. He was the 1st to describe *sublimation*—later a basic element in Freudian psychoanalysis—as the overcoming of one's passions and making them creatively useful. The rare individual who could do this Nietzsche called the "Overman" (*Übermensch*): he alone became a creator, rather than a creature, and thus had no need of power over others. In *Beyond Good and Evil*, 1886, and *The Genealogy of Morals*, 1887, Nietzsche noted the relativity of ethical systems. He divided them into two types: master morality and slave morality. Master morality was joyous: it was imposed by a ruling class which delighted in its power. Slave morality, however, the morality of Christianity, was imposed out of resentment felt by a weak and servile class which used religious dicta to terrorize its superiors. While he did not approve a return to master morality, Nietzsche called for a revision of Christian morality, for a "transvaluation of values."

Bergson

Henri Bergson (1859–1941) was educated at the École Normale Supérieure and spent much of his career as a professor at the Collège de France. His philosophy of "creative evolution" had a considerable influence on the literature and thought of the 20th cent. He was a defender of metaphysics and developed a theory of the relation of life and matter. In *Time and Free Will* (*Essai sur les données immédiates de la conscience*, 1889), *Matter and Memory*, 1896, and *Introduction to Metaphysics*, 1903, he contrasted 2 mental faculties—intellect

and intuition. The intellect, viewing things from the outside, conceives of them spatially, as a succession of static moments. Even time is so considered. Intuition, a part of the individual's self-consciousness, does not measure by clock time, but by "duration" (*durée*): it experiences an endless succession of states; it is aware of the constantly changing flow of consciousness. Bergson considered intuition to be a creative force which allows man to use his intellect to best advantage. He developed a philosophical theory of evolution in *Creative Evolution*, 1907. He believed that evolution proceeded, not by regular change, but by the *élan vital*, the vital impulse which brings new forms to life. He discussed 2 tendencies in the universe: a tendency to repetition and dissipation of energy, and the contrary thrust of life, constantly producing and renewing. In *Two Sources of Morality and Religion*, 1932, he applied these 2 tendencies to the study of social and religious groups.

Philosophy in the United States

William James (1842–1910) was a physician and psychologist before turning to philosophy. He wanted to use philosophy as therapy—to show men how they might lead better lives—and defended human initiative against such deterministic theories as Hegelianism and the evolutionary philosophy of Herbert Spencer (1820–1903). He is best known as an exponent of pragmatism (*Pragmatism, a New Name for Some Old Ways of Thinking*, 1909). The name pragmatism was coined by Charles Sanders Pierce (1839–1914). The meaning of an idea was considered to be the sum of all possible consequences which might ensue from the truth of that idea. An idea without consequences was not an idea at all. James embraced this theory, considering ideas as plans of action which should be tested frequently and discarded if they did not work. He was willing to accept any hypothesis whose consequences were useful to life.

John Dewey (1859–1952) was very different from James, but he, too, was a

psychologist and was interested in a philosophy that would affect culture and society. He developed out of his philosophy a system of education which was widely influential. His philosophical works include *How We Think*, 1910, *Human Nature and Conduct*, 1922, *Experience and Nature*, 1925, *The Quest for Certainty*, 1929, and *Logic, The Theory of Inquiry*, 1938. Dewey believed that the function of thought is problem solving; the value of an idea could be judged by the permanence of the belief or action to which it led. His educational theory stressed learning, not by memorization, but by problem solving, by thinking questions through and finding the most valuable solutions. He developed an ethical theory along the same lines: a new course of action had always to be judged by its degree of success in removing the causes of breakdown. Every idea was to be tested empirically, for Dewey had no interest in ideologies applied "from the top down."

George Santayana (1863-1952) and Alfred North Whitehead (1861-1947) were not born in the U.S., but they made considerable contributions to American philosophy. Santayana was born in Spain. He was educated at Harvard University and lived in the U.S. between 1872 and 1912. He was interested in aesthetics (*The Sense of Beauty*, 1896; *Interpretations of Poetry and Religion*, 1900) and in the use of the imagination. In *The Life of Reason*, 1905-6, he distinguished 2 major elements in man's nature, "impulse" and "ideation," which must unite in order for the individual to function properly. Impulse, he felt, is responsible for artistic creation; ideation, for wisdom. After leaving the U.S., Santayana devoted himself to theories of knowledge and metaphysics (*Realms of Being*, 1927-40). Combining realism and idealism, he decided that the existence of physical objects can never be proved but can be accepted on "animal faith" (*Scepticism and Animal Faith*, 1923). He asserted the existence of a realm of universals, which he called "essences."

Whitehead was trained in England as a mathematician and based his philosophy on logic and mathematics. He was invited

to the U.S. in 1924 to teach philosophy at Harvard University, where he remained until his death. He believed that experience is felt as interconnected continua of feelings and not as separate elements, and he tried to describe the overlapping of these continua by means of topology. His most important works include *Principles of Natural Knowledge*, 1919, *The Concept of Nature*, 1920, *Science and the Modern World*, 1926, *Process and Reality*, 1929, and *Adventures of Ideas*, 1933.

Logical Analysis

Bertrand Russell (b. 1872) has achieved eminence in several fields. He wrote on mathematics, philosophy, political affairs, and the history of philosophy. Trained as a mathematician, he began studying philosophy because he wished to find some reason for believing in the truth of mathematical precepts. He was first drawn to Hegelian idealism, but became a realist under the influence of George Edward Moore (1873-1958), who emphasized the importance of common-sense beliefs and everyday language. Furthering the work of Gottlob Frege (1818-1925) in mathematical logic, Russell rejected traditional descriptions of mathematical thought and attempted to reduce mathematics to logical principles. In *Principles of Mathematics*, 1903, he analyzed mathematical terms, forming them into purely logical concepts, in *Principia Mathematica*, 1910-13, he and Alfred North Whitehead developed a system of logic from which propositions of mathematics could be deduced. His analysis of sentences was of great influence on the school of logical positivism.

Logical positivism (or logical empiricism) was developed by Russell's pupil Ludwig Wittgenstein (1889-1951) and by the members of the "Vienna Circle" (Moritz Schlick, 1882-1936; Rudolf Carnap, b. 1891; *et al.*). They were influenced by the mathematical logic of Frege and Russell and the antimetaphysical attitude of Ernst Mach (1838-1916). Their philosophy, which claimed to be scientific, was based on linguistic analysis. They allowed only 2 sorts of statements:

factual ones, which could be verified, and the "analytical" statements of definition used in logic. All ethical and metaphysical statements were ruled out as 'nonsensical violations of the proper use of language. The most important publications of logical positivists are Schlick's *Allgemeine Erkenntnislehre*, 1918, Wittgenstein's *Tractatus Logico-Philosophicus*, 1921, Carnap's *Logical Syntax of Language*, 1934, and *Language, Truth and Logic*, 1936, by Alfred Jules Ayer (b. 1910), who spread the philosophy in England. Carnap formulated the most radical version of the theory, ruling out as nonsensical not only metaphysics but most of the postulates of science as well. All of the logical positivists have more recently modified their views.

Phenomenology

Phenomenology was developed by Edmund Husserl (1859–1938). He carried forward the "intentional psychology" of his teacher, Franz Brentano (1838–1916), by creating a philosophy which aimed at the description of experience. He did not intend empirically to study consciousness, but rather to examine our perceptions and beliefs from the inside. He wished to study things as they appear in consciousness; whether objectively existing entities or purely imaginary ones was immaterial. His "phenomenological method," the investigator's suspension of belief in the natural world in order to examine his consciousness, has been widely used by existentialists. His major publications include *Logical Investigations*, 1900–1901, *Formal and Transcendental Logic*, 1929, and *Cartesian Meditations*, 1931.

Existentialism

The name existentialism is given to the theories of a widely varied group of philosophers who by no means form a school or agree in all their ideas. In general, existentialists assert the freedom and dignity of man, protesting against deterministic theories which place man at the mercy of mechanical or natural processes. They object to generalizations and to

system building, nor do they wish to posit new dogmas, for they insist on the right of the individual to choose to believe and act as he desires. Thus, instead of writing philosophical treatises, some existentialists have preferred to express their ideas through informal essays and fiction. They assert that existence is absurd, for there is no ultimate explanation of why we exist. The existentialist dictum that "existence precedes essence" suggests the necessity for each man to make his own world and find his own meaning in life, rather than to accept traditional beliefs.

Much of existentialist theory was formulated in the late 19th cent., although its impact has been entirely on the 20th. Nietzsche, the Russian novelist Feodor Dostoevski (1821–81—*Notes from the Underground*, 1864), and the Danish religious thinker Søren Kierkegaard (1813–55—*Concluding Unscientific Postscript*, 1816) were the 1st existentialists. Karl Jaspers (b. 1883) described the dangers to individualism of modern technological society (*Die geistige Situation der Zeit*, 1931). He retained his religious faith, but referred, not to God, but to "transcendence," an unknowable source of being (*Philosophie*, 1932). Martin Heidegger (b. 1889) was a student of Husserl and made use of phenomenology in his philosophy. In *Sein und Zeit*, 1927, he described man as cast into an unsympathetic world in which he tries to achieve purposes which are ultimately rendered meaningless in death. Jean Paul Sartre (b. 1905) described his atheist version of existentialism in the treatise *Being and Nothingness*, 1943; in his plays *The Flies*, 1943, and *No Exit*, 1944; and in the series of novels *Les Chemins de la Liberté* (begun 1946). Both he and Albert Camus (1913–60—*The Stranger*, 1942; *The Plague*, 1947; *The Fall*, 1956; *The Myth of Sisyphus*, 1942; *The Rebel*, 1959) were profoundly influenced by their experiences during World War II. The defeat of France and the rise of resistance to the Nazis suggested to them the necessity for each individual to take responsibility for his fate. Gabriel Marcel (b. 1889) developed a religious form of existentialism.

Literature

BRITAIN, IRELAND, AND THE COMMONWEALTH

18th Cent.

POETRY. In most of Europe the literature of the 18th cent. was dominated by a classical revival, characterized by a devotion to reason, propriety, balance, and purity of form. The works of antiquity were revered and imitated. In England the outstanding poet of the neoclassical period was Alexander Pope (1688–1744), who welded the heroic couplet into a lethal weapon in a masterful series of satires beginning with *Essay on Criticism*, 1711. Other poets of importance in Pope's time were James Thomson (1700–1748) and John Gay (1685–1732). In the latter half of the century the neoclassical traditions were carried on by Oliver Goldsmith (1728–74), author of *The Deserted Village*, 1770, an attack on industrialization, and Thomas Gray (1716–71), whose *Elegy in a Country Churchyard*, 1751, celebrates rural life. Preromantic strains are discernible in the nature poetry of William Collins (1721–59), the melancholy "graveyard" verse of Edward Young (1683–1765), and the medieval ballads of Thomas Chatterton (1752–70). Also noteworthy in this period were George Crabbe (1754–1832), who offered a harsh, naturalistic view of village life, and Robert Burns (1759–96), the national poet of Scotland, who combined humor and lyricism in such memorable dialect poems as *To a Mouse*, 1785.

PROSE. Among 18th-cent. prose writers Pope's counterpart was Jonathan Swift (1667–1745), whose savage satires (particularly *Gulliver's Travels*, 1726) pilloried human life remorselessly. A more benign spirit ruled in the urbane essays of Joseph Addison (1672–1719), who collaborated with Richard Steele (1672–1729) on the famous journal, the *Spectator*, 1711–12, 1714. After 1750 the reigning sovereign of English letters was

Samuel Johnson (1709–84). A powerful Latinate style, a moralistic, somewhat didactic bent, and a sober skepticism informed such great critical works as the *Lives of the Poets*, 1779–81. Other significant figures in the realm of nonfiction prose were James Boswell (1740–95), author of the *Life of Samuel Johnson*, 1791, the historian Edward Gibbon (1737–94), and the statesman Edmund Burke (1729–97).

THE NOVEL. The outstanding literary development of the 18th cent. was the emergence of the modern realistic novel. The chief innovators in this new genre were Daniel Defoe (1660–1731), author of such "autobiographical" histories as *Moll Flanders*, 1722, Samuel Richardson (1689–1761), whose *Clarissa Harlowe*, 1747–48, became the prototypical work of sentimentalism and middle-class morality, and Henry Fielding (1707–54), a bawdy but humane novelist who gave the world one of its great comic masterpieces, *Tom Jones*, 1719. Subsequent practitioners of the novel form included Tobias George Smollett (1721–71), the Gothic horror writer Ann Radcliffe (1764–1823), and the great humorist Laurence Sterne (1713–68).

19th Cent.

ROMANTICISM: POETRY. The romantic era in English literature spanned roughly the first $\frac{1}{3}$ of the 19th cent. It represented a rebellion against the Industrial Revolution and a rejection of 18th-cent. neoclassicism. Politically, the romantics favored equality and social justice. Aesthetically, they discarded the principles of reason, propriety, and simplicity of form in favor of intuition, individualism, love of nature, and expansive, highly colored diction. The period began with the appearance of *Lyrical Ballads*, 1798, by William Wordsworth (1770–1850), in whose works nature is glorified

as a moral teacher and poetry becomes "the spontaneous overflow of powerful feelings." Wordsworth's friend and collaborator, Samuel Taylor Coleridge (1772-1834), showed his fascination with the supernatural in such haunting, evocative poems as *The Rime of the Ancient Mariner*, 1797-98. Contemporaneously, a love of the past and a gift for narrative verse marked the poetry of Sir Walter Scott (1773-1832). Among the younger generation of romantic poets George Gordon Byron (1788-1824), Percy Bysshe Shelley (1792-1822), and John Keats (1795-1821) were the foremost figures. Byron, a social rebel, ran the gamut from agonized confessions to the great satiric epic *Don Juan*, 1819-24. Shelley declared his Neoplatonist sympathies in such poems as *Prometheus Unbound*, 1820, and *Ode to the West Wind*, 1819. Keats produced a series of rich, sensuous meditations on the nature of beauty, most notably *Ode on a Grecian Urn*, 1820, and *To Autumn*, 1820.

NONFICTION PROSE. Major contributions in nonfiction prose were made by Charles Lamb (1775-1834), whose gentle, humorous essays appeared under the name "Elia"; William Hazlitt (1778-1830), an accomplished stylist and sensitive critic; and Thomas De Quincey, best remembered for his autobiographical *Confessions of an English Opium Eater*, 1821.

THE NOVEL. The leading novelists of the period were Walter Scott, who displayed his impressive gift for historical romance in such works as *Quentin Durward*, 1823, and Jane Austen (1775-1817), the 1st great novelist of manners, whose delicately precise style and fine eye for nuance reached their apex in *Pride and Prejudice*, 1813.

VICTORIANISM: POETRY. The Victorian age is generally thought to have begun with the passage of the Reform Bill of 1832. As a literary era, it is marked by an interest in social reform, a widening breach between science and religion, and an extreme didacticism. In poetry, it produced at least 2 figures of the 1st rank, Alfred Tennyson (1809-92) and Robert Browning (1812-89). Tennyson's lyric

poetry achieved a mellifluous, free-flowing beauty, while *Idylls of the King*, 1859, an extended treatment of the Arthurian legend, lamented the moral decay in Victorian society. Cultivating a much rougher poetic line, Browning imitated the fitful movements of the human mind in brilliant dramatic monologues like *Fra Lippo Lippi*, 1855. In contrast to Browning's rugged verse stood the lush post-romanticism and medievalism of the Pre-Raphaelite school, particularly Dante Gabriel Rossetti (1828-82) and Algernon Charles Swinburne (1837-1909). Other poets of note in this era were William Morris (1834-96), Elizabeth Barrett (1806-61), the novelist George Meredith, and Matthew Arnold (1822-88), whose *Dover Beach*, 1867, announced the poet's melancholy disillusionment. In the late Victorian period the vigorous, infectious rhythmic verse of Rudyard Kipling (1865-1936) made him world famous.

NONFICTION PROSE. Nonfiction prose of high distinction was produced by the historian Thomas Babington Macaulay (1800-1859); by Thomas Carlyle (1795-1881), a stern critic of his society; by John Ruskin (1819-1900), whose notions of art were set forth masterfully in *The Stones of Venice*, 1851-53; by John Henry Newman (1801-90), a penetrating religious thinker and eloquent stylist; and by Matthew Arnold, who advanced a classically oriented social criticism in *Culture and Anarchy*, 1869.

THE NOVEL. Victorian fiction soared to extraordinary height with the emergence of Charles Dickens (1812-70). *David Copperfield*, 1849-50, showed its creator's gift for robust characterization, good-natured humor, entertaining melodrama, and the exposure of social abuses. Other Victorian novelists followed Dickens' lead. William Makepeace Thackeray (1811-63) turned his powerful gift of comic irony on fashionable society in *Vanity Fair*, 1847-48. Charles Reade (1814-84) gave English literature one of its greatest historical novels, *The Cloister and the Hearth*, 1861. The Brontë sisters, Charlotte (1816-55) and Emily (1818-48), earned lasting fame with, respectively, *Jane Eyre*, 1847, and *Wuthering Heights*,

1847. George Eliot (pseudonym of Mary Ann Evans, 1819–80) excelled in the realistic depiction of provincial life, a talent best exhibited in *Middlemarch*, 1872. Of slightly less stature, Anthony Trollope (1815–82) also focused his attention on the provinces. More psychological than either Trollope or Eliot, George Meredith (1828–1909) studied the comic aspects of human behavior in *The Ordeal of Richard Feverel*, 1859. Thomas Hardy (1840–1928) sounded a much gloomier note, imparting a bleak, morbidly deterministic mood to such novels as *The Return of the Native*, 1878. The master romanticist among the Victorian novelists was Robert Louis Stevenson (1850–94), who combined romance and psychology in *The Master of Ballantrae*, 1889. Lesser figures in the realm of Victorian fiction include Edward Bulwer-Lytton (1803–73), Benjamin Disraeli (1804–73), and Charles Kingsley (1819–75).

20th Cent.

POETRY. Abandoning his career as a novelist, Thomas Hardy devoted his energies exclusively to poetry after 1895. The morbid determinism and harsh texture of his verse represent a distinct departure from Victorianism. Such a departure was also apparent in the verse of Gerard Manley Hopkins (1844–89), published posthumously in 1918 by the poet's friend and disciple, Robert Bridges (1844–1930). The religious intensity and metrical irregularity of Hopkins' verse appealed to the modern age, and his reputation has grown steadily.

Although somewhat marred by sentimentality, the poetry of A. E. Housman (1859–1936) achieved a classical purity of form and an exquisite precision of phrasing that won him a wide audience. Of slightly less stature were Rupert Brooke (1887–1915) and Wilfred Owen (1893–1918), 2 gifted poets whose careers were cut short by World War I. Numerous schools of poetry sprang up during the war, notably the imagists (an English version of the American movement founded by Amy Lowell), whose most prominent adherents were Richard Ald-

ington (1892–1962) and D. H. Lawrence. Imagism strove to eliminate abstractions from poetry and to employ an impressionistic technique. Concurrent with the imagists was the Georgian school, which sought escape from the unpleasantness of modern life in bucolic settings (*vide* W. H. Davies, 1871–1940).

The 2 most influential poets of the 20th cent. writing in English were the Irishman, William Butler Yeats (1865–1939) and the American-born Thomas Stearns Eliot (1888–1965). Yeats began as a lyric poet of deeply romantic sensibilities, but in the period preceding World War I underwent a period of disillusionment with his former beliefs and thereafter, in works like *Responsibilities*, 1914, his diction grew sparser and the content of his verse more intellectual. Most of his subsequent poetry, relying for philosophical framework on a system expounded in *A Vision*, 1925, showed a profound despair over contemporary life, a continual hardening of style, and a highly recondite symbolism.

In the 1930's a wave of Marxism swept across England, carrying on its crest C. Day Lewis (b. 1901), Stephen Spender (b. 1909), and W. H. Auden (b. 1907). The most important of these was unquestionably Auden, whose marriage of colloquialism and polished literary diction can be seen in poems like "Venus Will Now Say a Few Words," 1930.

Of the poets who achieved prominence in the post-World War II period, Dylan Thomas (1914–53), a master of lush lyricism, was probably the greatest. Other figures of note are Philip Larkin and John Wain.

ESSAYS AND CRITICISM. Predominant in the art of the essay during the Edwardian years, 1901–10, were the fervent Catholic Gilbert Keith Chesterton (1871–1936) and the elegant, urbane Max Beerholm (1872–1956). In a more revolutionary vein, Herbert George Wells (1866–1946) provided lively and perceptive social criticism, while George Bernard Shaw turned his attention to everything from music criticism to economic problems with the same witty, delightfully imperious results.

FICTION. The naturalistic school of Zola revealed its impact on English writing in the works of George Moore (1852-1933), Arnold Bennett (1867-1931), and John Galsworthy (1867-1933). All 3 relied to a large extent on accurate chronicling of social details. Galsworthy, however, must be singled out for his uniquely evocative style.

The psychological novel found its proponents in Ford Madox Ford (1873-1939) and Joseph Conrad (1857-1924). Both were disciples of Henry James and, less directly, Turgenev. Emphasizing the inner life of his characters, Conrad sought to recreate their elusive experience through the use of flashback, fragmented narrative, and point-of-view techniques, and a heavily impressionistic style. *Lord Jim*, 1900, and *Nostromo*, 1904, are among his best works. Conrad's friend and sympathizer, Ford, employed his own variety of psychological realism, using jumbled time schemes and stream-of-consciousness in such works as *The Good Soldier*, 1915.

The spirit of liberalism that informed the writings of H. G. Wells found a very different spokesman in E. M. Forster (b. 1879). Forster's humane, compassionate temperament can be seen in the anti-imperialistic *A Passage to India*, 1924. Forster was part of a literary set known as the Bloomsbury Group which called for more emphasis on psychological realism. Next to Forster, Bloomsbury's most important writer was Virginia Woolf (1882-1941), whose novels ignored the social and physical side of experience, focusing exclusively on various states of the conscious mind.

However, the writers who broke most sharply with tradition were D. H. Lawrence (1885-1930) and James Joyce (1882-1941), who may be viewed as the 2 opposing poles in modern fiction. Both displayed a far-reaching disenchantment with modern life, but here the similarity ends. Lawrence, a visionary and impassioned primitive, pilloried the scientific and rational spirit of the age. His novels (e.g., *The Rainbow*, 1915, *Women in Love*, 1920) are written in an onrushing, romantic diction that seeks the mystical

essence of the novelist's characters. By contrast Joyce's novels reveal a static, formalistic approach. A great innovator, Joyce moved from the lyrical, intensely personal *A Portrait of the Artist as a Young Man*, 1916, to the greater objectivity, intricate symbolism, and stylistic virtuosity of *Ulysses*, 1922, which in effect introduced the stream-of-consciousness method into English literature.

Among other, lesser novelists who felt equally alienated from their society were Aldous Huxley (1894-1963), who wrote a series of bitter, satirical novels on modern life; Evelyn Waugh (1903-66), also a satirist, whose mordant Catholic novels flayed society with a kind of witty cruelty; and Graham Greene (b. 1904), another Catholic, who produced a series of lean, tough novels about human frailty that employ some of the technique and framework of the "thriller."

The art of the short story found its most brilliant exponent in Katherine Mansfield (1888-1923). Miss Mansfield's delicate neurasthenic temperament expressed itself in such stories as "The Garden Party," 1922, where unsatisfied, Chekhovian longings are sketched with great refinement and attention to nuance. Elizabeth Bowen (b. 1899) exhibits a similar sensibility in novels like *The Death of the Heart*, 1938.

Since the end of the 1920's English literature has abandoned its former experimental qualities, emphasizing instead traditional forms of expression, a greater concern for objective reality, and moral consciousness. This is particularly true of the novel, where such figures as C. P. Snow (b. 1905) and Angus Wilson recall the ethical and social awareness of George Eliot. Exceptions to this trend are Iris Murdoch (b. 1919), whose novels often make use of bizarre, almost baroque elements, and Lawrence Durrell (b. 1912), whose lushness of style, exotic settings, and omnipresent symbolism set him off from his contemporaries.

CANADA. The outstanding poetic school in 19th-cent. English-speaking Canada was the "Confederation Group," in which C. D. G. Roberts (1860-1943) and William Bliss Carman (1861-1929)

were major figures. Contemporaneously, Canadian fiction produced such writers as John Richardson (1796-1852) and William Kirby. In the 20th cent Robert Service (1871-1958) became internationally known with his Yukon ballads (e.g., "The Shooting of Dan McGrew"), Stephen Leacock (1869-1944) achieved similar fame for his satires, and novelists Morley Callaghan (b. 1903) and Hugh MacLennan (b. 1907) became familiar to Canadian and non-Canadian readers alike.

AUSTRALIA. The adoption of the "bush idiom" as a literary style in the 1880's gave rise to the 1st uniquely Australian literature, specifically in the bush ballads of Adam Lindsay Gordon (1833-70) and, at the turn of the century, Henry Lawson (1867-1922). Lawson also displayed striking gifts as a short-story writer. In the realm of fiction Lawson is equaled only by the novelist Henry Handel Richardson (pseudonym of Henrietta Richardson, 1870-1916).

UNITED STATES

18th Cent.

POETRY. Though not a period of literary giants, the 18th cent produced several writers of interest and importance. In Philadelphia a circle of neoclassicists grew up which included Thomas Godfrey (1736-63) and Francis Hopkinson (1737-91). In New England a group known as the "Hartford wits" became famous through the satires and mock epics of John Trumbull (1750-1831) and Joel Barlow (1754-1812). But the finest American poet of this century was the fiery patriot Philip Freneau (1752-1832), who, though an imitator of English verse styles, showed a certain originality in such efforts as the romantic *The Wild Honey-suckle*, 1788.

PROSE. Prose was well in advance of poetry during the 18th cent. William Byrd (1674-1744), a Virginia aristocrat, left behind diaries and several discursive studies of southern life. Benjamin Franklin (1706-90), a jack of all trades and master of many, won fame with his collections of homely maxims (e.g., *Poor Richard's*

Almanack, 1732-57) and his uncompleted *Autobiography* (begun in 1771), the 1st self-portrait by an American. Far from the serene capitalism and cheerfully middle-class ethics of Franklin, Jonathan Edwards (1703-58) revealed a stern Puritan temperament and great intellectual vigor. A fine prose stylist, his best-known work is the sermon *Sinners in the Hands of an Angry God*, 1741, while *The Freedom of the Will*, 1754, shows his consuming interest in philosophy. Other prose writers of note in the 18th cent. were William Bartram (1739-1823), author of travel literature from which Coleridge and Wordsworth borrowed, and Michel Guillaume Jean de Crèvecoeur (pen name J. Hector St. John, 1735-1813), a Frenchman who produced some interesting descriptions of life in America, including the famous essay *What Is An American?* Though not strictly speaking a literary figure, Thomas Paine (1737-1809) showed an impressive command of language in his impassioned political pamphlets (e.g., *Common Sense*, 1776).

19th Cent.

POETRY. In the 19th cent American poetry came of age. William Cullen Bryant (1794-1878) wrote memorable nature poetry and Edgar Allan Poe (1809-49) superimposed a gloomy melodiousness on his Gothic subject matter. In Boston, Henry Wadsworth Longfellow (1807-82), Oliver Wendell Holmes (1809-94), and James Russell Lowell (1819-91) formed a group of poetically inclined Brahmins. John Greenleaf Whittier (1807-92) won immortality with homespun poems like "Barbara Frietchie." Of considerably greater stature were Emily Dickinson (1830-86), whose brief, fragile lyrics often departed from traditional prosody, and Walt Whitman (1819-92), who wrote a frank, virile free verse that revolutionized American poetry. In the South, Sidney Lanier (1812-81) achieved lasting fame.

FICTION. American fiction as a major force began with the delightful sketches of Washington Irving (1783-1859) and continued through the Leatherstocking frontier novels of James Fenimore

Cooper (1789-1851). In the same period, nonfiction prose of the highest order was written by the transcendentalists Ralph Waldo Emerson (1803-82) and Henry David Thoreau (1817-62). The American novel reached decisive greatness with the somber, guilt-ridden *The Scarlet Letter*, 1850, by Nathaniel Hawthorne (1804-64) and the cosmic whaling saga *Moby Dick*, 1851, by Herman Melville (1819-91). Shortly afterward the great humorist Mark Twain (pseudonym of Samuel Clemens, 1835-1910) proved himself a great novelist too with *The Adventures of Huckleberry Finn*, 1884. Meanwhile tales of local color were supplied by Bret Harte (1836-1902). The realistic novel was officially sponsored by William Dean Howells (1837-1920) and resulted in the psychological realism of Henry James (1843-1916), and the naturalism of Stephen Crane (1871-1900) and Frank Norris (1870-1902). Of these writers James bulks the largest. In *The Portrait of a Lady*, 1881, and *The Ambassadors*, 1902, he emerged as a master of the point-of-view technique, seeking to present the world through the expanding moral awareness of his characters.

20th Cent.

POETRY. American poets in the 20th cent. have produced a staggeringly rich body of work. The trail breaker was Edwin Arlington Robinson (1869-1935), a dry ironist through whose brilliantly chiseled verse blew the bleak winds of New England. Concentrating on the misfits and outcasts of modern life, Robinson painted a gallery of memorable character portraits. Another New Englander, Robert Frost (1874-1963), also broke ground for modern poetry, creating a carefully understated verse that crackled with sly humor and adroit colloquialisms. Outside New England a good deal of poetic activity was concentrated in the imagist school, whose members were H. D. (Hilda Doolittle, 1886-1961), Ezra Pound (b. 1885), and Amy Lowell (1874-1925). The imagists called for a sensuous verse freed of philosophical stuffing and built with clear, concrete images. Although imagism

left few poems of lasting value, it stimulated much experimentation. William Carlos Williams (1883-1963), employing a colloquial idiom and free-verse forms, chose prosaic subject matter and made it poetry. Beginning under the influence of the imagists, Wallace Stevens (1879-1955) went on to establish himself as a pre-eminent force in American poetry, cultivating an aloof, detached manner, an almost dandiacal elegance of diction, and a kind of neohumanistic philosophy. Coming of age in the 1920's along with Stevens were Marianne Moore (b. 1887), a creator of urbane, precisely worded verse; e. e. cummings (Edward Estlin Cummings, 1894-1962), whose lyrical and witty poems often made use of typographical effects; Hart Crane (1899-1932), who set out to create an epic about America. During this period the 2 most influential of modern American poets also came to the fore, Ezra Pound and T. S. Eliot (1888-1965). Breaking away from the imagists, Pound's poetry began to reflect a new and difficult diction, an interest in the literature of other countries, an anti-rational bent, and a disgust with modern society (e.g., *Hugh Selwyn Mauberley*, 1920). Eliot shared most of his friend's attitudes; his masterpiece, *The Waste Land*, 1922, is a panoramic view of modern life, heavily symbolic, incorporating numerous passages from other authors and other languages, and attempting to depict the spiritual aridity of the contemporary age. Contemporaneous with Eliot and Pound were the southern poets John Crowe Ransome (b. 1888) and Allen Tate (b. 1899), who developed their own tradition of sophisticated formalism and keen irony. To further enrich the last quarter of the century, several minor poets made their mark, among them Edgar Lee Masters (1869-1950), Carl Sandburg (1878-1967), Vachel Lindsay (1879-1931), Robinson Jeffers (1887-1962), Stephen Vincent Benét (1898-1943), and Edna St. Vincent Millay (1892-1950).

The Great Depression of the 1930's stimulated a new proletarian verse, but little of it reached the level of excellence achieved by the preceding generation.

Archibald MacLeish (b. 1892), beginning with an "invocation to the social muse," soon abandoned social themes for a more subjective form of verse. Of those poets 1st heard in the 1930's Muriel Rukeyser (b. 1913) and Louise Bogan (b. 1897) are among the best remembered. Following World War II, a highly introverted "confessional" school of poetry emerged; its best-known member is Robert Lowell (b. 1917). For the most part, postwar poets have been plagued by a growing alienation from the general public and a shrinking market for poems. It has become convenient to divide contemporary poetry into the academics—those poets connected with a university and writing a dry, abstract verse—and the underground poets—practitioners of a wild, unorthodox poetry usually hostile to the intellectual establishment. Theodore Roethke (1908–64) is an example of the 1st school, Allen Ginsberg (b. 1926) of the 2nd.

FICTION. The 20th cent. opened with the publication of *Sister Carrie*, 1900, by Theodore Dreiser (1871–1945); the frank realism and unflagging energy of this and other Dreiser novels compensated for their technical awkwardness. Working in the naturalistic tradition of Frank Norris, Upton Sinclair (1878–1968) published *The Jungle*, 1906, an exposé of the meat-packing industry. More sophisticated criticism of America was provided by the trenchant social satire of Sinclair Lewis (1885–1951), who took aim at the smugness and hypocrisy of the middle class with deadly accuracy. *Main Street*, 1920, and *Babbitt*, 1922, are typical of his better work. Edith Wharton (1862–1937) used the novel of manners to expose the tradition-bound mores and cruel codes of the American aristocracy. Willa Cather (1873–1947), a gifted regionalist, laid bare the greed of the West in *Death Comes for the Archbishop*, 1927. A different kind of realism flowed through the robust adventure stories of Jack London (1876–1916).

But aesthetically speaking, the real revolutionaries were the avant-garde writers who grew up in the 1st 2 decades of the century. Gertrude Stein (1874–1946), enthroned in her Paris salon, reigned as queen of experimental writing. Her in-

fluence was felt by such figures as Sherwood Anderson (1876–1941), who employed a bare, unadorned style to chronicle frustrated dreams; John Dos Passos (b. 1896), whose novels presented life in a jumble of narrative, headlines, and "newsreels"; and Ernest Hemingway (1898–1961), perhaps Miss Stein's greatest disciple. Rejecting the traditional forms of literary diction, Hemingway, in works like *The Sun Also Rises*, 1926, developed a lean, economical style aimed at communicating the most powerful feelings in the fewest possible words. The other great spokesman for what Miss Stein called the "lost generation" was F. Scott Fitzgerald (1896–1940), official biographer of the Jazz Age, whose haunting novel *The Great Gatsby*, 1926, expressed both the frenetic vitality of the 1920's and the author's romantic disillusionment.

Also a romantic, William Faulkner (1896–1962) found most of his inspiration in the sweat-soaked life of his native Mississippi, from which he carved a rich microcosm called Yoknapatawpha County. In such novels as *Absalom, Absalom!*, 1938, and *Light in August*, 1935, he portrayed the South as "a land primed for fatality," tragic and decadent, struggling to redeem itself from the curse of slavery.

Under the influence of Joyce and Lawrence, a rash of *Bildungsroman* appeared in America, each evoking the young manhood of its author. The best of these was *Look Homeward, Angel*, 1927, by Thomas Wolfe (1900–1938), a long, loose, ornately styled novel. The 1930's brought a new wave of social realism to literature, of which the Studs Lonigan trilogy by James T. Farrell (b. 1904) is a good example. But the best writer to emerge from this movement was John Steinbeck (1902–68), whose *The Grapes of Wrath*, 1939, stated eloquently the plight of migrant workers in California. A solitary figure during the 1930's was Nathanael West (1902–40), author of 4 short, bitter novels about the various myths and illusions manufactured by contemporary society. Another writer who stood apart from the social realism of the time was Katherine Anne Porter (b. 1890), whose lyrical short stories, written in a stream-of-

consciousness style, emphasized psychology and symbolism.

Since World War II proletarian writing has given way to a fiction based on the problems of the individual. Alienation of man from society is a popular theme, appearing in such works as *The Catcher in the Rye*, 1951, by J. D. Salinger (b. 1919), *The Adventures of Augie March*, 1953, by Saul Bellow (b. 1915), and *Invisible Man*, 1952, by Ralph Ellison (b. 1914). The Salinger and Bellow works also indicate a trend toward picaresque plotting and a colloquial, often comic, prose style. In the 1960's "black humor," a type of grotesque satire, developed. *Giles Goat Boy*, 1966, by John Barth (b. 1930), is a prominent example. Simultaneously, Bernard Malamud (b. 1914), author of several brooding novels of Jewish life, found a large popular audience with *The Fixer*, 1966.

FRANCE

18th Cent.

THE ENLIGHTENMENT. For the most part French poetry lay fallow in the 18th cent., though the didactic works of Jacques Delille (1738-1813) showed definite skill, and the fervent verse of André de Chénier (1762-94) anticipated later developments in romantic poetry. The greatest contribution of the French Enlightenment was in the area of social thought, where Montesquieu (Charles de Secondat, 1689-1755) led the way with *L'Esprit des Lois*, 1748, a prodigious and influential study of political institutions. The leading man of letters in this century, however, was unquestionably Voltaire (François Marie Arouet, 1694-1778), whose voluminous output included short verse, epic poems, classical tragedies, essays, and historical works. A champion of reason and an unrelenting opponent of ignorance, intolerance, and outmoded institutions, Voltaire vented his rage most memorably in such satires as *Candide*, 1759, and *L'Ingénue*, 1767. In addition, he was one of the countless intellectuals who contributed to the *Encyclopédie*, 1751-80 (35 vols.), a work of staggering proportions whose aim was nothing less than the

systematic organization of all learning. More than anything else it typifies the French Enlightenment, with its fierce confidence in the powers of knowledge and human progress. Others who devoted their time and wisdom to this great work were Denis Diderot (1713-84), Jean d'Alembert (1717?-83), and Claude Adrien Helvétius (1715-71). The most gifted of these was Diderot, whose philosophical essays, critical writings, and the brilliant dialogue *Le Neveu de Rameau*, 1762, have made his reputation secure. In philosophy the dominant figure of the 18th cent. was Jean Jacques Rousseau (1712-78), whose famous attack on society, *Contrat Social*, 1762, trumpeted the cause of the "natural man" and made its author world-famous. In his novel *La Nouvelle Héloïse*, 1761, and his renowned *Confessions* the passionate and rebellious Rousseau prefigured the romantic sensibility. In the domain of the novel proper, the outstanding accomplishments of this period were the realistic *La Vie de Marianne*, 1731-41, by Pierre de Marivaux (1688-1763), the psychological *Manon Lescaut*, 1731, by the Abbé Prévost (1697-1763), and the wittily amoral *Les Liaisons dangereuses*, 1782, by Choderlos de Laclos (1741-1803).

19th Cent.

ROMANTICISM. During the Napoleonic era, 2 major literary figures emerged: François René de Chateaubriand (1768-1848) and Mme. de Staël (1766-1817). Chateaubriand eloquently reasserted the traditional Christian values, adopting a highly colored prose that made him known as the father of romanticism. De Staël, very much a daughter of the Enlightenment, defended democratic institutions in a series of critical works and romances. Three transitional figures, the poets Pierre Jean de Béranger (1780-1857) and Alphonse de Lamartine (1790-1869) and the philosopher Hugues Félicité Robert de Lamennais (1782-1854), helped pave the way for the French romantic movement. It arrived torrentially in the 2nd quarter of the century, bringing to the fore Victor Hugo (1802-85), Alfred de Musset (1810-

57). Alfred de Vigny (1797–1863), Théophile Gautier (1811–72), and Gérard de Nerval (pen name of Gérard Labrunie, 1808–55). In both verse and drama these revolutionaries abandoned classical rules in favor of unrestrained emotionalism and florid diction. Hugo, with his astonishing profusion of odes, ballads, and philosophical poetry, was the Promethean figure of this school. Sainte-Beuve (1801–69) was the guiding critical force of romanticism.

PARNASSIANISM AND SYMBOLISM. The transition from romantic to modern poetry was stimulated by Charles Baudelaire (1821–67) in his brilliantly evocative *Fleurs du mal*, 1857, in which the poet dwelt fondly on unsavory, forbidden experiences. In the wake of this work a new school, known as Parnassianism, arose. Led by such former romantics as Gautier and Leconte de Lisle (1818–94), the Parnassians raised the banner of art for art's sake, advocating purity of expression and the subordination of feeling to form. Sully Prudhomme (1839–1907), José Maria de Heredia (1842–1905), Paul Verlaine (1844–96), and Stéphane Mallarmé (1842–98) were among the young poets attracted to this movement.

Emotionally sterile, Parnassianism soon gave way to symbolism, the foremost practitioners of which were Mallarmé, Verlaine, and Arthur Rimbaud (1854–91). Making extensive use of symbols, these poets groped after strands of mysticism and strove to suffuse their work with the rich, mysterious qualities of music. An all-pervasive suggestiveness was their aim: to express the ineffable. A later phase of symbolism, 1880–85, known as the "decadent period," produced Jules Laforgue (1860–87). The influence of Mallarmé, Verlaine, Rimbaud, and Laforgue on modern poetry throughout the western world has been immense.

FICTION. In fiction the romantics were represented by the inexhaustibly prolific Hugo (*Les Misérables*, 1862); the tormented, introspective Benjamin Constant de Rebecque (1767–1830), author of *Adolphe*, 1815; the inventive Alexandre Dumas (1802–70), creator of such great adventure novels as *Monte Cristo*, 1845;

and the impassioned humanitarian George Sand (pseudonym of Amandine Dupin, Baronne Dudevant, 1804–76). Ranged in opposition to the romantics were great realistic novelists like Honoré de Balzac (1799–1850), Stendhal (pseudonym of Marie Henri Beyle, 1783–1812), and Gustave Flaubert (1821–80). Balzac displayed his withering skepticism and exceptional talent for characterization in the massive series *La Comédie humaine*, novels which explored every stratum of French society. Stendhal depicted the tragic unsuitability of the romantic temperament in post-Napoleonic France in *Le rouge et le noir*, 1831. Flaubert, something of a romantic himself, subordinated this side of his nature to a painstakingly classical style and a realistic point of view; *Madame Bovary*, 1857, is his greatest work. In the last third of the century realism hardened into naturalism, a mode more or less invented by Émile Zola (1840–1902), who sought to transform the novel into a scientific study of man and his environment (e.g., *L'Assommoir*, 1877). Naturalism also produced the outstanding short-story writer of the period, Guy de Maupassant (1850–93), a masterfully controlled craftsman and penetrating observer of human psychology. Alphonse Daudet (1840–97), another naturalist, also made his mark in the short-story form. A *fin de siècle* reaction against naturalism produced the ivory-tower aestheticism of J. K. Huysmans (1818–1907), whose most famous work is the influential *À Rebours*, 1884.

20th Cent.

POETRY. Though modern French poetry has not maintained the brilliance of the 19th cent., several figures of great interest have appeared. Chief among these is Paul Valéry (1871–1945), a symbolist who created a highly introverted and self-analytic verse. In the period preceding World War I, Valéry was joined by the Catholic prose poet Paul Claudel (1868–1955) and Charles Péguy (1873–1914), another Catholic, whose work displayed mystical and patriotic strains.

Surrealism, one of the most viable

movements in contemporary French poetry, had its roots in the pre-World War I verse of Guillaume Apollinaire (1880-1918), who attempted to follow the lead of the cubist painters and produce a thoroughly modern, antitraditionalist poetry. The founders of surrealism were André Breton (1896-1966), Paul Éluard (Eugène Grindel, 1895-1952), and Louis Aragon (b. 1897). Freudian psychology had a powerful impact on this new school, which sought to depict the activities of the unconscious mind by presenting experience in a series of disordered, dreamlike images. The interest in preconscious mental states encouraged "automatic writing." In the 1930's the best of the surrealist poets, Aragon and Éluard, abandoned the movement in favor of Marxism.

During World War II the threat of Nazism united the divergent strains in French poetry for a while, and patriotic verse abounded. Following the war, poets maintained their ties with popular sentiments for a time and then returned to a more personal and esoteric manner.

The best of the postwar poets are Pierre Jean Jouve (b. 1887), whose verse is dipped in a deeply felt pessimism; Saint-John Perse (Alexis Saint-Léger Léger, b. 1887), a highly cerebral poet with a disciplined style; and Jules Supervielle (1884-1960), an apostle of simplicity whose main gifts were wit and a sly charm. Also noteworthy in the contemporary period are Jacques Prévert (b. 1900) and René Char (b. 1907).

NONIMAGINATIVE PROSE. The spirit of self-analysis in the French temperament resulted in such autobiographical writings as the famous *Journal* of André Gide (1869-1951), with its lucid, penetrating style. Jules Renard (1864-1910), François Mauriac, and Julian Green issued similar works in this vein. Many novelists also turned their pens to translations, biography, and criticism. Marcel Proust translated John Ruskin's writings; Mauriac brought out a volume of perceptive reflections on his contemporaries; Romain Rolland (1866-1944) produced biographies of Tolstoy and Beethoven. Rolland's work, however, was transcended by an outstanding biographer

of the modern period, André Maurois (Émile Herzog, b. 1885), whose studies of Hugo, Proust, and Balzac have won him a high place in French letters.

FICTION. The modern French novel has significantly outpaced the poetry of the period, contributing several Promethean figures. In the ranks of the titans one finds Marcel Proust (1871-1922), whose huge novel cycle, *À la recherche du temps perdu*, 1913-28, has already taken its place as one of the enduring classics of world literature. In this remarkable work Proust analyzes the fashionable society of his time, creating a world of infinite subtlety and nuance and filling it with characters whose lives seem no less genuine to the reader than his own. The governing theory of *À la recherche* is that experience is fully comprehended only when sorted out and scrutinized by memory.

André Gide, another luminary of the post-World War I years, was not a novelist of Proust's stature, but his intriguing fiction (*L'Immoraliste*, 1902) combined with his brilliant *Journal* made him an immortal in his own lifetime. He promulgated a doctrine of radical freedom in which man could free himself from all soul-destroying restraints.

The vogue of the novel cycle continued after the success of Proust's great work with *Les Thibault*, 1922-40, by Martin du Gard (1881-1958), which offers an extended family history. Jules Romains (b. 1885) contributed another such cycle in *Les hommes de bonne volonté*, 1932-47, based on the principle of "unanimism," a theory which held that one underlying factor forms the basis of all human life. The most popular novel cycle of the period (though far from the greatest) was Romain Rolland's *Jean Christophe*, 1904-12, which focuses on a composer of Beethovenesque genius.

World War I produced a substantial body of antiwar literature. The most gifted exponent of this mode was Georges Duhamel (1884-1966), whose *La Vie des Martyrs*, 1917, emphasizes the cruel absurdity of war.

Of the woman writers who appeared in the 1st quarter of the century, the most highly regarded is Colette (Sidonie

Gabrielle Colette, 1873–1954), whose brief, carefully polished stories generally deal with the turbulence of romantic love.

In the 1930's French writing took on an intensely political and social tone. On the left, the proletarian novel found passionate partisans in Charles Plisnier (1897–1952), a Belgian, and Louis Aragon. On the right, Louis Ferdinand Céline (Louis Fuch Destouches, 1894–1961) showed conservative, even fascist, leanings. His most famous work is the bleak *Voyage au bout de la nuit*, 1932.

The modern French short story owes much to the pen of Marcel Aymé (1902–67), whose sardonic humor has made him an international favorite. Others who have worked successfully in this form are Paul Morand (b. 1888) and Jean Cassou (b. 1897).

The working out of human destinies within a Catholic framework became the domain of François Mauriac (b. 1885), who drew his materials from bourgeois life in the provinces. Cultivating a classically pure style, Mauriac regarded the inevitable clash between body and soul with brooding compassion in such brilliant novels as *Thérèse Desquyroux*, 1927, and *Le Noeud de vipères*, 1932. Second only to Mauriac among the Catholic novelists is Georges Bernanos (1888–1948), who presented the struggle for salvation in the starkest possible terms. His masterpiece is *Journal d'un curé de campagne*, 1936, an episodic study of a young cleric's struggles.

Humanism found its most eloquent voice in André Malraux (b. 1901), a Marxist who showed that he understood the human soul, singly as well as collectively. The best of his ideologically based novels is *La Condition humaine*, 1933. Following World War II Malraux renounced Communism. Also of humanistic leanings, but less political in orientation, Antoine de Saint-Exupéry (1900–1944) sought a transcendent reality in the exaltation of flying, a search beautifully described in *Vol de nuit*, 1932. More memorable, however, is his charming children's fantasy, *Le petit prince*, 1943.

Henry de Montherlant (b. 1896) carried on the traditions of French realism,

exhibiting a keen eye for social problems and a fine command of language. *Les Jeunes Filles*, 1938–39, may be singled out for special praise.

The existentialist school of philosophy, popular in France after 1930, exercised a profound influence on the world of letters. The most famous of the existentialist writers is Jean Paul Sartre (b. 1905), whose bleak view of a meaningless universe in which man must choose his own values is reflected in *La Nausée*, 1938. Simone de Beauvoir (b. 1908), a disciple of Sartre, established her reputation with *L'Invitée*, 1943. Generally associated with the existentialists, Albert Camus (1913–60) expounded his famous theory of an "absurd" universe in works like *L'Étranger*, 1942, in which the author's style is remarkable for its combination of lucidity and lyricism.

After World War II the avant-garde novel came into fashion in France. A revolt against the old forms took place and writers began to experiment with new methods of construction, the result was the so-called antinovel. The chief practitioners of this new mode are Nathalie Sarraute (b. 1900) and Alain Robbe-Grillet (b. 1922). In a lighter vein, the novels of Raymond Queneau (b. 1903) found favor in the 1950's.

CANADA. The most memorable poetry to come out of French speaking Canada in the 19th cent. was the patriotic verse of Octave Crémazie (1822–79). In fiction, the novel *Les anciens canadiens*, 1863, by Philippe Aubert de Gaspé (1786–1871) was the outstanding work. After the turn of the century symbolist and Parnasian influences became pronounced in French-Canadian poetry; the formalistic verse of Jean Charbonneau is exemplary. Among contemporary novelists of importance are Claude Henry Grignon and Léo Paul Desrosiers (b. 1896).

GERMANY

18th Cent.

CLASSICISM AND STURM UND DRANG. In the early decades of the 18th cent., German classicism, under the leadership of the critic Johann Christoph

Gottsched (1700–1766), instituted a somewhat slavish imitation of French theories. Rebellng against French influence and demanding mote room for personal inspiration, F. G. Klopstock (1724–1803) produced a body of ardently patriotic verse. His work helped spark a revival of interest in German antiquity, though no poets of the 1st rank emerged until the arrival of Goethe. Worthy of mention, however, is C. M. Wieland (1733–1813), author of several verse romances and one of the 1st to translate Shakespeare. A major force in the search for a national consciousness was the critic and playwright Gotthold Ephraim Lessing (1729–81), who rejected the French authority and looked instead to England and to classical Greece for aesthetic guidance, adapting both of these cultures to the needs of contemporary Germany. *Laokoon*, 1766, is his best-known critical treatise.

The 4th quarter of the 18th cent. was dominated by 2 movements, *Sturm und Drang* and classicism. The former represented an attempt to throw off the hegemony of rationalism. Radical individualism, *Weltschmerz*, and an emphasis on the primacy of feeling were some of the hallmarks of this new school. Its greatest disciple was Johann Wolfgang von Goethe (1749–1832), whose early lyrics set the tone for all *Sturm und Drang* literature. In fiction, too, it was Goethe's *Die Leiden des jungen Werthers*, 1774, that became the dominant work. It was in dramatic arts, however, that *Sturm und Drang* flourished most impressively. There Goethe was rivaled by Johann Christoph Friedrich von Schiller (1759–1805). The foremost critical spokesman for *Sturm und Drang* was Johann Georg Hamann (1730–88). Wild and undisciplined, the movement soon expended its energies and yielded to the chastening influence of a resurgent classicism, one which combined the old, idealistic yearning and violent individualism with a new sense of duty and control. The aesthscian Johann Gottfried von Herder (1744–1803) enunciated most of the major principles of classicism in his writing, particularly the notion of

Humanitat (humanitarianism), which stresses the need of each country for an indigenous literature, one that draws on folklore and tradition. Abandoning *Sturm und Drang*, Goethe and Schiller soon became the leading forces in this classical school with a brilliant outpouring of plays and ballad poetry. In fiction, Goethe loomed equally large, contributing the immortal *Bildungsroman*, *Wilhelm Meisters Lehrjahre*, 1795–96.

19th Cent.

ROMANTICISM. Near the end of the 18th cent German romanticism began to emerge, even as classicism was coming into full bloom. Rabid subjectivism, sentimental yearning for the unattainable, and an interest in the supernatural were among the characteristics that marked the romantic movement in Germany. Two separate schools existed, 1 founded in 1798 (in which Johan Ludwig Tieck, 1773–1853, was the leading figure) and 1 in 1801, whose best-known representative was Clemens Brentano (1778–1842).

After 1809 romanticism as an organized movement ceased to exist, although it survived in such solitary geniuses as Heinrich von Kleist (1777–1811), the Prussian dramatist and short-story writer, and the novelist E. T. A Hoffmann (1776–1822). At the same time the classicism of Goethe burst powerfully on the world in *Faust*, Part I, 1808. Part II, 1832, brought the poet's powers to their apex.

In lyric poetry the 2 foremost names after 1835 were Eduard Mörke (1804–75) and Heinrich Heine (1797–1856). Heine was the leader of a movement known as "Young Germany," which lodged vigorous protests, literary and political, against the old order.

FICTION. After the death of Heine, German fiction began to outstrip poetry. A realistic regionalism appeared in such writers as Adalbert Stifter (1805–68), Gottfried Keller (1819–90), and Theodor Storm (1817–88).

Writers of a somewhat different stamp were the antibourgeois Wilhelm Raabe (1831–1910); Conrad Ferdinand Mayer (1825–98), author of several historical

Novellen; and Theodore Fontane (1819–98), who focused on social problems. Naturalism made itself felt at the end of the century in the poetry of Arno Holz (1863–1929) and the prose of Wilhelm von Polenz (1861–1903).

20th Cent.

POETRY. Germany's 1st major poet after the turn of the century was Stefan George (1868–1933), champion of aestheticism. His formalistic and somewhat esoteric verse shows him to be a descendant of the French symbolists. At the same time a spirit of classical control hovers over his poetry. A poet of equal delicacy, Hugo von Hofmannsthal (1871–1929) created a small but striking body of lyric poetry. Introspection and a sense of the evanescence of human experience dominate his verse.

The outstanding German poet of the modern period is Rainer Maria Rilke (1875–1926). A hypersensitive temperament is apparent throughout his work and also a strong lyrical impulse. Spiritual dilemmas generally form the subject matter of his poetry, an onrushing, almost rhapsodic flow of verse carries him through these dilemmas. World War I had a deadening effect on Rilke's creativity, but in 1922 his inspiration reawakened triumphantly, and he completed the *Duineser Elegien* and *Sonette an Orpheus*.

Another rich vein of poetic activity was the expressionist school, which called for a rebellion against traditional values and the materialism of modern Germany. Revolted by what they saw, the expressionist poets turned inward, attempting to depict states of mind in place of external reality. In their poems the logical structure is suppressed and bizarre images often predominate. The key figures in expressionist poetry were Georg Heym (1887–1912), Georg Trakl (1887–1914), Ernst Stadler (1883–1914), Heinrich Lersch (1889–1936), and Gottfried Benn (1886–1956).

The 3rd Reich brutally interrupted the development of modern literature in Germany. But following World War II a new group of poets appeared. Günter Eich (b. 1907) and Paul Celan (b. 1920)

reflect the shock and despair of postwar Germany in their deliberately fragmented, disconnected verse. Wilhelm Lehman (b. 1882), though belonging to an older generation, came into prominence after the war. Peter Huchel (b. 1903) has shown a gift for verse dealing with rustic life.

FICTION. At the turn of the century Vienna was one of the great cultural centers of Europe. Among the writers it nurtured was Arthur Schnitzler (1862–1931), a trenchant analyst of character and manners in the upper layers of Viennese society. A sharp sense of irony tempered his impressionistic portraits in such stories as *Die griechische Tänzerin*, 1901. Another astute critic of Austrian life was Robert Musil (1880–1942), whose massive novel *Der Mann ohne Eigenschaften*, 1930–43, recognized only after World War II, became 1 of the most highly regarded works of modern German literature.

The greatness of Rilke is counterbalanced in the novel by that of Thomas Mann (1875–1955). Influenced by Wagner and the symbolist movement, Mann interlaced his works with myths, leit-motifs, and symbols. His subject matter was usually the German *bourgeoisie*, whose decadence he portrayed with unparalleled profundity in his 1st great work, *Buddenbrooks*, 1901. A philosophical tone predominates in Mann's works, especially in his masterpiece *Der Zauberberg*, 1924.

Mann's older brother Heinrich (1871–1950) was a more outspoken critic of specific social and political corruptions. Later he exhibited a gift for the historical novel. By contrast the mystical, impressionistic works of Hermann Hesse (1877–1962) explored the interior life of man (e.g., *Demian*, 1919).

The expressionist movement had ramifications in the domain of fiction, whereas in poetry it dealt with alienation and sought to depict mental states. Though he later abandoned expressionism, Franz Werfel's (1890–1945) early works reveal the impact of this vital school. Simultaneously, however, a far greater novelist was at work. Franz Kafka (1883–1924)

successfully objectified a series of frightening neuroses in his novels and stories, and described his painful isolation from the world of ordinary men. Guilt and anxiety are the ruling moods in Kafka's world, where large inscrutable institutions torment people for unstated offenses. In novels like *Der Prozess*, 1925, reality is distorted systematically, and the characters find themselves trying to deal rationally with an irrational universe.

German fiction became more objective during the 1920's with the founding of a movement called *Die neue Sachlichkeit*. Out of this school came Arnold Zweig (b. 1887), Erich Maria Remarque (b. 1898), and Hans Fallada (1893-1947). But technical innovation did not cease. Stream-of-consciousness was employed successfully in the novels of Hermann Broch (1886-1951), especially *Das Tod des Vergil*, 1945.

Since World War II literary activity has been heavy. Wolfgang Borchert (1921-1947) depicted the chaos and pessimism of postwar life. Max Frisch (b. 1911), a Swiss, Heinrich Böll (b. 1917), Günter Grass (b. 1927), and Uwe Johnson (b. 1934) are others who have made names for themselves in the field of the modern novel.

RUSSIA

18th and 19th Cents.

18TH CENT. Relatively little writing of the 1st rank was produced in Russia during the 18th cent., a period during which German, French, and English models were imitated shamelessly. Among those who showed some degree of originality were Mikhail Lomonosov (1711-65), a ground-breaking critic and poet; Gavriil Derzhavin (1743-1816), author of several remarkable odes; and Alexander Radishchev (1749-1802), whose work of social criticism, *Journey from St. Petersburg to Moscow*, 1790, marks the beginning of revolutionary literature in Russia. Also noteworthy were Nikolai Karamazin (1766-1826), who introduced numerous linguistic reforms and left some memorable fiction. Two of Karamazin's disci-

ples, Vasilii Zhukovski (1783-1852) and Konstantin Batzushkov (1787-1855), won fame as poets.

19TH CENT. The 1st great literary figure in Russian history was Alexander Pushkin (1799-1837), whose vigorous and original genius expressed itself in dramatic narratives, folk tales, and the great verse novel *Eugeni Onegin*, 1836. Second only to Pushkin during this era was Mikhail Lermontov (1814-41), a lyric poet of great distinction, while the metaphysical poetry of Fyodor Tyutchev (1803-73) made him another major figure.

In the 2nd half of the century a symbolist movement appeared in reaction against the dominance of realism in Russian letters that developed after 1850. Alexander A. Blok (1880-1921) was the leading figure of this movement.

In fiction, Lermontov, though chiefly a poet, nevertheless succeeded in giving Russia one of its 1st important novels, *A Hero of Our Times*, 1840. But the finest fiction of the period 1800-1850 was written by Nikolai V. Gogol (1809-52), a realist whose satires of provincial life reached their culmination in *Dead Souls*, 1842. Following Gogol's lead, Ivan A. Goncharov (1812-91) created one of Russia's great classics of realism, *Obломov*, 1858.

From the 1850's onward, 3 extraordinary giants divide the laurels of Russian fiction. Ivan Turgenev (1818-83) carried on the traditions of Pushkin and Gogol in such triumphs of irony and compassion as *A Sportsman's Sketches*, 1847-52. Feodor Dostoevski (1821-81) de-emphasized the importance of external reality and concentrated on the spiritual and psychological turbulence of his characters. *The Brothers Karamazov*, 1880, is his masterpiece. Count Lyev Tolstoy (1828-1910) showed his broad human sympathies and his profound sense of historical movement in the great classic of world literature, *War and Peace*, 1869.

The outstanding master of the short-story form during the 19th cent. was Anton Chekhov (1860-1904), whose gently ironic tales undercut the hopeless dreams of their characters. Maxim Gorky (1868-1936), exponent of social realism,

made his mark before the Revolution as a novelist and playwright, and went on to become a leading literary figure in the later Soviet state.

20th Cent.

POSTREVOLUTIONARY LITERATURE. After the Revolution a vigorous control over literary activity was exercised by the government, and literature was expected to reflect official Soviet values: confidence in Communism, love of the proletariat, and the importance of communal action.

POETRY. The new Marxist aesthetic produced poetic propagandists for the most part, but one figure, Vladimir Mayakovsky (1884-1930), exhibited genuine poetic gifts. He was part of a "futurist" movement, which called for the abolition of all literary traditions and the creation of a new Soviet literature. He himself celebrated the Revolution and the Russian people in a highly colloquial free verse. The best of Mayakovsky's numerous disciples is Nikolai Asyev (b. 1889).

Although the majority of poets expressed the philosophy of the state, a few turned instead to subjective concerns. Chief among these, and perhaps the greatest Russian poet of the 20th cent., was Boris L. Pasternak (1890-1960). Pasternak began as a futurist, and produced 2 long narrative poems on social themes, but his natural tendencies carried him toward the lyric, where nature, religion, individualism, and eternal human values were the focus of his attention. Stylistically, Pasternak's poetry is unorthodox, but powerful rhythmic and melodic qualities are present. It has often been accused of obscurity by Soviet critics. Nikolai Tikhonov (b. 1896), another poet of independent temperament, mixed romance and realism in his multivarious outpouring of tales, ballads, and lyrics.

After the death of Stalin, the government's rigid control over literary activity was somewhat relaxed, and 2 highly individualistic poets, Yevgeny Yevtushenko (b. 1933) and André Voznesensky (b. 1931) appeared. In the late 1960's poets

and other creative writers found rather rigid controls re-imposed.

FICTION. Fiction under the Soviet regime has concentrated on social realism and is often marred by too blatant propaganda. At the same time, however, the influence of Russia's 19th-cent. masters has not been entirely obliterated. The spirit of Dostoevski is present in the writings of Leonid M. Leonov (b. 1899), who emphasizes character development (e.g., *The Thief*, 1927), and a Chekhovian tone pervades the fiction of Konstantin A. Fedin (b. 1892). Similarly, the novels of Aleksandr A. Fadayev (1901-56) reflect the influence of Tolstoy. Seeking to bridge the gap between the Russian masters and the new social realism, A. N. Tolstoy (1883-1945) wrote his memorable novel *The Road to Calvary*, 1920, the events of which span the pre- and post-revolutionary periods. Also noteworthy is the novelist Isaac Babel (b. 1894).

The writer who best succeeded in adapting the art of the novel to the demands of proletarian writing was Mikhail Sholokhov (b. 1905), whose 2 great works, *And Quiet Flows the Don*, 1940, and *The Don Flows Home to the Sea*, 1941, are epic novels of Russian life which display a skillful, Tolstoyan balance between panorama and character delineation.

In spite of the Marxist edict that literature must follow the party line, satires of Communist life have been permitted over the years, most notably in the case of E. I. Zamyatin (1884-1937), whose stories exposed the follies of bureaucracy. However, his extraordinary novel, *We*, 1924, was considered too subversive and was banned. Ilya Ehrenburg (b. 1891) and Mikhail Zoshenko (1895-1958) are 2 other writers who have worked well in the satirical manner.

The most famous Russian novel of modern times is undoubtedly *Doctor Zhivago*, 1955, by Boris Pasternak. This is a long, richly drawn work about the life of a young poet and doctor who witnesses the Revolution and its aftermath. The book was banned in Russia because of its implied criticism of Communism. Nevertheless, the period of de-Stalinization in Russia had at least made

it possible to attack the abuses of the Stalin era, as can be seen in the famous *One Day in the Life of Ivan Denisovich*, 1962, by Aleksandr I. Solzhenitsyn (b. 1918).

ITALY

18th and 19th Cents.

18TH CENT. In the 1st half of the 18th cent. the Arcadians, a highly academic school of poets, held sway in Italy. The verse dramas of Metastasio (Pietro Trapassi, 1698–1782) were the finest products of Arcadianism. After 1750 a reaction against the aridity of the Arcadians brought the vigorous Sicilian Giovanni Meli (1740–1815) to the fore. Also crucial to the literary revival of this period was the cultural historian, Giovanni Battista Vico (1668–1744). A healthy, viable neoclassicism appeared in the odes of Giuseppe Parini (1729–99) and in the balanced, well-ordered verse of Vincenzo Monti (1754–1828).

Toward the end of the 18th cent a new spirit of romanticism began to express itself. It is particularly evident in the poetry of Ugo Foscolo (1778–1827), which blends deeply felt patriotism, classical harmony, and romantic pessimism.

19TH CENT. In the 1st half of the 19th cent. the romantic and classical schools overlapped. The towering giant of Italian classicism was Giacomo Leopardi (1798–1837), whose lyrical poetry expressed in a lucid, masterfully controlled style a profound sadness over man's fate.

Alessandro Manzoni (1785–1873) was the leader of the romantic school in Italy. He is best known for *I promessi sposi*, 1825–26. Romanticism was closely allied with the *Risorgimento*, and the patriotic impulse was passionately indulged by writers like Giuseppe Mazzini (1805–72) and Francesco De Sanctis (1817–83).

In the latter part of the 19th cent. romanticism was abandoned and realism became the dominant trend. Among the poets Giosuè Carducci (1835–1907) reflected this new outlook, combining it

with a revived classicism. But in prose, realism tended to be regionalism. The greatest prose writer of the period was the novelist Giovanni Verga (1840–1922).

20th Cent.

POETRY. Italian literature of the early 20th cent. gave the world of letters one of its most glamorous figures, Gabriele D'Annunzio (1863–1938), whose romantic verse sweeps the reader exultantly from nature to nationalism to self-glorification. Elsewhere in Italian poetry of the period, 2 major schools were discernible: the “*crepuscolare*” poets (e.g., Guido Gozzano, 1883–1916), who adopted a disenchanted malaise as their basic attitude, and the futurists (e.g., Filippo Marinetti, 1876–1944), who denounced all literary tradition and pursued a dynamic and violent modernism in their poetry.

During the Mussolini years the “hermetic” school came into the forefront, advocating a dry, abstract formalism (e.g., Giuseppe Ungaretti, b. 1888). Since World War II the futurist school has yielded to a more realistic approach, and Italian poetry has become more responsive to political and social forces.

PROSE. Though not strictly speaking creative authors, Benedetto Croce (1866–1952) and Giovanni Gentile (1875–1944) made enormous contributions to Italian literature. With the publication of *Estetica*, 1902, Croce established himself as one of the most influential aestheticians of the century. Gentile, one of Croce's disciples, produced several impressive studies of Italian authors.

In fiction the poet D'Annunzio was active, but without much distinction. More important work issued from such figures as Grazia Deledda (1875–1936), who faithfully recorded the way of life in Sardinia, and Alfredo Panzini (1863–1939), who cultivated a fine-drawn irony blended with precision of style. Of the writers who came into prominence during the Fascist era, the most unusual was Italo Svevo (pseudonym of Ettore Schmitz, 1864–1928), whose novel *La Coscienza di Zeno*, 1923, has gained an

international audience. The novel of social protest found an able practitioner in Ignazio Silone (pseudonym of Secondo Tranquilli, b. 1900), whose anti-Fascist left-wing sympathies were set forth in *Pane e vino*, 1937.

After World War II a striking revival took place in Italian fiction. Cesare Pavese (1908-50) and Elio Vittorini (b. 1908) led the way with several vigorous, neorealistic novels. They were soon followed by Vasco Pratolini (b. 1913), who re-created working-class life with accuracy and compassion. Carlo Levi (b. 1902) extended his reputation far beyond Italy with *Cristo si è fermato a Evoli*, 1945. The postwar novelist of greatest renown, however, is Alberto Moravia (pseudonym of Alberto Pincherle, b. 1907), whose novels are marked by a cold, analytical detachment and well-realized sense of

to naturalism in her studies of Galicia. Standing apart from regionalism and naturalism alike, Benito Pérez Galdós (1843-1920) gave his novels a broader scope, treating the entire Spanish nation and its recent history in a prolific flow of novels.

20TH CENT. Modern Spanish literature began with the "generation of 1898," which sought to rehabilitate a demoralized country. Among the poets of this period were the Andalusians Juan Ramón Jiménez (1881-1958) and Antonio Machado Ruiz (1875-1939). The subsequent generation, however, produced the best-known Spanish poet of this century, Federico García Lorca (1899-1936), whose lyrical verse draws heavily on the rhythms and themes of folk ballads. The surrealist poet Vicente Aleixandre (b. 1900) also produced much work of merit.

In prose the greatest spokesman for the generation of 1898 was the philosopher and essayist Miguel de Unamuno y Jugo (1864-1936). His influence on contemporary thought was rivaled only by José Martínez Ruiz (b. 1874) and José Ortega y Gasset (1883-1955). Among novelists of this generation, the outstanding figures are Pío Baroja y Nessi (1872-1956), a vigorous master of picaresque adventure; Ramón de Valle Inclán (1870-1936), an eclectic and imaginative writer; Ramón Pérez de Ayala, (b. 1881), a satirical novelist; Gabriel Miró Ferrer (1879-1930), a creator of mystical, dreamy romances; and Vicente Blasco Ibáñez (1867-1928), whose novel *The Four Horsemen of the Apocalypse*, 1918, made him world-famous. Among the more prominent younger novelists is Camilo José Cela (b. 1916).

PORTUGAL. Dominating the 1st half of the 19th cent., Portuguese romanticism produced the poetry of Almeida Garrett (1799-1854) and the novels of Camilo Castello-Branco (1826-90). A rebellious movement known as the "Coimbra Group" and led by the poet Antero de Quental (1842-91) ruled the 2nd half of the century. Camilo Pessanha (1871-1926), a deeply subjective poet, and Aquilino Ribeiro (1879-1941), a skillful

SPAIN AND PORTUGAL

18TH CENT. A time of great intellectual awakening in Spain, the 18th cent. produced such enlightened critical forces as Ignacio de Luzán Claramunt (1702-54) and Benito Jerónimo Feijóo y Montenegro (1676-1764), both products of the French Enlightenment. In opposition to these rationalist and humanistic tendencies stood the truculently reactionary scholastic, Juan Pablo Forner (1756-97).

19TH CENT. Romanticism burgeoned briefly (and belatedly) in Spain, giving the country 1 important poet, José de Espronceda y Delgado (1808-42), but no novelists of the 1st rank. However, the fierce subjectivism and individuality of romantic poetry paved the way for the more enduring verse of Gustavo Adolfo Bécquer (1836-70) and Gaspar Núñez de Arce (1834-1903).

The growth of the Spanish novel was linked with regionalism. The greatest example of this tradition was José María de Pereda (1833-1906), whose novels chronicled the life of his native Santander with extraordinary verisimilitude and richness. In the next generation Emilia Pardo Bazán (1852-1921) carried realism

novelist, are 2 of the many figures who have emerged since 1900.

LATIN AMERICA

18th Cent.

CULTERANISMO AND NEOCLASISICISM. A classical movement took hold of Latin American letters in the 18th cent. with generally stultifying results. Numerous poets wrote exclusively in Latin, and a new term, *culteranismo*, was coined to describe their pomposities of style. But in the 2nd half of the century the currents of neoclassicism, emanating mainly from France, had an invigorating effect, and social critics began to appear. The most gifted of them were the Peruvian Pablo de Olavide (1725-1804), the Ecuadorian Francisco Eugenio de Santa Cruz Espejo (1747-95), and the Mexican Fray Servando Teresa de Mier (1765-1827). The only poet of note in this era was the bucolic Mexican, Manuel de Navarrete (1768-1809).

19th Cent.

ROMANTICISM. For 70 years following their emancipation the Latin American nations produced a literature of romanticism in which strong nationalistic sentiments predominated. The Argentine poet Esteban Echeverría (1809-51) is generally considered to have inaugurated this movement. Among the many Argentine poets who joined it were Olegario Víctor Andrade (1841-82) and Rafael Obligado (1851-1920). Elsewhere in South America romanticism begot an equally popular school of poetry; its members included the Chilean Salvador Sanfuentes (1817-60), the Bolivian Adela Zamudio (1854-1928), the Uruguayan Juan Carlos Gómez (1820-84), and the Mexican Fernando Calderón (1809-45).

Romanticism permeated the fiction of the 19th cent. as fully as it did the poetry, beginning in Mexico with José Joaquín Fernández de Lizardi (1776-1827) and continuing in Argentina with José Mármol (1817-71). Other novelists of a romantic stamp were the Uruguayan

Alejandro Magariños Cervantes (1825-93), the Ecuadorian Juan León Mera (1832-94), and the Colombian Jorge Isaacs (1837-95), author of the most famous novel in Latin American history, *María*, 1867. But the most impressive of the romantic writers was the Argentinian Domingo Faustino Sarmiento (1811-88).

The inevitable reaction against romanticism came in 1888 with the publication of *Azul*, a brilliant and influential book of poems by the Nicaraguan Rubén Darío (Félix Rubén García Sarmiento, 1867-1916). The influence of French symbolism and Parnassianism pervaded these rich, exotic poems.

BRAZIL. In Portuguese-speaking Brazil, 19th-cent. literature followed a predictably similar course to that of the other Latin American states. The period of romanticism issued in the patriotic verse of Domingos José Gonçalves de Magalhães (1811-82) and Antônio Gonçalves Dias (1823-64). In the 1880's romanticism gave way to Parnassianism and such ivory-tower "formalists" as Raimundo Correia (1860-1911) and Olavo Bilac (1865-1918) took over the leadership of Brazilian poetry.

A moreninha, by Joaquim Manuel de Macedo (1820-82), is considered to be the 1st Brazilian novel. But the 1st work of literary importance is *Memórias de um sargento de milícias*, 1854, by Manuel Antônio de Almeida (1830-61). The next step forward came with the cyclic novels of José Martiniano de Alencar (1829-77). These stages of development culminated in Joaquim Maria Machado de Assis (1839-1908), the greatest of all Brazilian novelists. Toward the end of the century, social realism made its appearance in the works of Aluísio Gonçalves de Azevedo (1857-1913) and others.

20th Cent.

MODERNISM. The modernism of Rubén Darío continued to dominate Latin American literature after the turn of the century. Among Darío's disciples were the Argentinian Leopoldo Lugones (1874-1938), the Colombian Guillermo Valencia (1873-1943), and the Mexican

Amado Nervo (1870-1919). However, Darío, who remained nominal leader of the modernist school, began to move away from it, returning to traditional forms and more humanistic concerns. At the same time, some of his followers, notably Lugones and Nervo, had passed into new phases of modernism. Perpetuating the earlier symbolist phase of *modernismo* was, among others, a group of women poets that included the Nobel prize winner, Gabriela Mistral (Lucila Godoy Alcayaga, 1889-1957), and Delmira Agustini (1887-1914). Also direct descendants of modernism were the Mexican Ramón López Velarde (1888-1921), a lyric poet; the Guatemalan Rafael Arévalo Martínez (b. 1884), a mystic; and the Cuban Nicolás Guillén (b. 1904), who made effective use of native techniques and rhythms in his verse.

VANGUARD MOVEMENT. After 1910 a general break with modernism took place. Mexico's Enrique González Martínez (1871-1952) and Uruguay's Julio Herrera y Reissig (1875-1910) struck out on their own, setting new styles and experimenting with new techniques. Along with Darío, Lugones, and Nervo, they anticipated the next move in Latin American letters, vanguard literature. Born of the nihilistic disillusionment that followed World War I and bred by the general turbulence of political and social institutions in South America, the vanguard movement espoused radical experimentation. Free verse, new forms, startling images, bizarre syntax—these were a few of the things the new literary rebels advocated. *Ultraistas* was the name given to these poets and writers, the most prominent of whom were César Vallejo (1895-1938) of Peru, Jorge Luis Borges (b. 1900) of Argentina, and Pablo Neruda (b. 1904) of Chile. The latter, creating verse of uniformly high quality and ranging from neoromanticism to surrealism, has established himself as the greatest of modern South American poets.

PROTEST LITERATURE. The political and social turmoil of Latin America ensured the primacy of social protest in the novel. The precursors of modern fiction were Chile's Baldomero Lillo

(1867-1923) and Mexico's Federico Gamboa (1864-1939), naturalists in the Zola tradition. Later, somewhat more sophisticated writers emerged, including Mariano Azuela (1873-1952) of Mexico, whose *Los de abajo*, 1915, is a penetrating study of the Mexican Revolution, and José Rubén Romero (1890-1952), another Mexican. The passionate concern with social conditions swelled the growing *indianista* literature, a body of work dating from the 19th cent., which exposed the terrible plight of the Latin American Indian. In their novels and stories the Peruvian Enrique López Albuja (b. 1872), the Bolivian Alcides Argüedás (1879-1946), and the Ecuadorian Jorge Icaza (b. 1906) took up the Indian's cause.

The painful process of modernization served as an additional spur to social and economic commentary. The inevitable abrasion between modern dynamism and old, settled ways was ably reflected in the fiction of the Argentinians Benito Lynch (1885-1952) and Ricardo Güiraldes (1886-1927), and of the Uruguayan Javier de Viana (1872-1927). The problems of urban life were examined in the memorable writings of Argentina's Manuel Gálvez (b. 1882) and Chile's Manuel Rojas (b. 1896) and Eduardo Barrios (b. 1881). While men sought to exploit the natural resources of Latin America in arid plain and dense jungle, the struggle was recorded by Horacio Quiroga (1878-1937) of Uruguay and José Eustasio Rivera (1889-1928) of Colombia.

Nor has the psychological novel been absent from Latin America, as the works of María Luisa Bombal (b. 1910) bear witness. At the same time, historical fiction found a skilled exponent in Enrique Rodríguez Larreta (1875-1961), and powerful social criticism has flowed from the pen of the Nobel prize winner, Miguel Asturias.

BRAZIL. In Brazil modern literary developments paralleled those of Spanish America with only a few exceptions. Poets like Bilac and Alberto de Oliveira (1857-1937) perpetuated the escapist tendencies of symbolism and Parnassianism after the turn of the century. But in 1922 came the Brazilian version of vanguard writing.

The *modernistas*, as the avant-garde authors were termed, proclaimed their revolt against tradition. The standard-bearer of revolution among poets was Mario de Andrade (1893-1945). Other *modernistas* of distinction were Manuel Bandeira (b. 1886), and Jorge de Lima (1898-1953). More recently, Vinícius de Moraes (b. 1913) has come to the fore.

Brazilian prose in this century began on a high level with Euclides da Cunha (1896-1909), whose epic work *Os sertões*, 1902, set the tone for the protest writing that was to come. Regionalism and a search for native subject matter resulted in the "Northeastern school" of the 1930's, which focused on the problems of the Brazilian backlands. Among the key figures in this school were José Lins do Rego (1901-57), whose great "sugar cane" novel cycle has already become a classic, and Jorge Amado (b. 1912), a Marxist of almost hypnotic power. Departing from this general trend, the cosmopolitan and experimental Erico Veríssimo (b. 1905) has concentrated on the individual and his problems.

SCANDINAVIA

Sweden

18TH CENT. Voltaire's classicism and Rousseau's idealism were the major forces in 18th-cent. Swedish literature. The classical temper is evident in the satirical poetry of Olof von Dalin (1708-63), while Rousseau's influence is equally pervasive in the prose of Thomas Thorild (1759-1808). Standing apart from these trends were the lyric poet Carl Michael Bellman (1740-95), the philosopher Emanuel Swedenborg (1688-1772), and the scientist Carl von Linné (Linnaeus, 1707-78), whose travel books are remarkable for their lucid prose style.

19TH CENT. In Sweden the 1st half of the 19th cent. was dominated by romanticism, a movement in which the poet Per Daniel Amadeus Atterbom (1790-1855) and the critic Esaias Tegnér (1782-1846) were 2 of the leaders. The period from 1850 to 1875 witnessed the growth of realism in such writers as Fredrika

Bremer (1801-65) and, with the appearance of the great playwright August Strindberg, realism became naturalism. In the 1880's, however, a sharp reaction against naturalism resulted in a brilliant group of neoromantic writers that included Selma Lagerlöf (1858-1940) and Verner von Heidenstam (1859-1940).

20TH CENT. In the 20th cent. Sweden's realistic traditions re-emerged with such vigorous talents as Hjalmar Söderberg (1869-1941) and Hjalmar Bergman (1883-1930); the latter was a gifted psychological novelist who anticipated Sweden's greatest literary figure of this century, Pär Lagerkvist (b. 1891). Poet, playwright, and novelist, Lagerkvist portrays the spiritual crises of modern man unforgettably, though there is also a political strain in his works. The gifted poet Birger Sjöberg (1885-1929) was one of his followers.

The influence of American writers, especially Ernest Hemingway, resulted in a group called "The Young Five," of which the most important members were Artur Lundkvist (b. 1906) and Harry Martinson (b. 1904). Of equal importance are Eyvind Johnson (b. 1900), a realist who recorded the abuses of the industrial system, and Agnes von Krusenstierna (1894-1940), whose novels examined sexual problems with great sensitivity. Since World War II the interest in realism has grown even stronger.

Norway

18TH CENT. Due to the political unity that existed between Denmark and Norway in the 18th cent., a Dano-Norwegian culture developed, in which the outstanding figure was Ludvig Holberg (1684-1754), poet, essayist, and playwright. Simultaneously, a separatist movement spawned such poets as Jens Zetlitz (1761-1821) and Johan Nordahl Brun (1745-1816).

19TH CENT. Gaining its independence from Denmark in 1814, Norway sought a national consciousness. This search is reflected in the great romantic poet Henrik Arnold Wergeland (1808-45), from whose work a massive folk tale

and ballad revival issued. At the same time, 1850–80, European realism was on the rise and these 2 forces combined to produce the fierce social protest of Henrik Ibsen and Bjørnstjerne Bjørnson (1832–1910), playwright, novelist, and poet. But the 1890's brought a revolt against realism in such neoromantic figures as Knut Hamsun (1859–1952).

20TH CENT. In modern Norway the "epic," a long series of novels about a particular region or family, became the dominant literary trend. The 1st of the epicists was Johan Bojer (1872–1959), who glorified the Norwegian fishermen. He was followed by Knut Hamsun, who, abandoning romanticism, began to write in this new mode. But the 2 greatest epic writers were Sigrid Undset (1882–1949), whose novels probed the role of women in the modern world, and Olav Duun (1876–1939), who concentrated on country life.

The best poets of this generation were Olay Bull (1883–1933) and Arnulf Överland (b. 1889), the former a charming lyricist, the latter a passionate, patriotic leftist. Överland's verse set the tone for the literature of the 1930's, which dwelt heavily on anti-Fascist themes. After World War II the best writings produced in Norway were reminiscences and accounts of the war.

Denmark

18TH CENT. During the 1st half of the 18th cent. lyric poetry of a high order flowed from H. A. Brønson (1694–1764) and Ambrosius Stub (1705–58). Both were surpassed, however, by Johannes Fureld (1743–81), whose verse exploited Scandinavian folklore extensively. Contemporaneously, the humorist Johann Herman Wessel (1742–85) created a striking body of satirical plays, poems, and stories.

19TH CENT. Like most of Europe, Denmark experienced a romantic period in the 1st half of the 19th cent., and a subsequent upsurge of realism after 1850. The best-known products of Danish romanticism are Hans Christian Andersen (1805–75) and Søren Kierkegaard (1813–55), while the famous critic, Georg

Brandes (1842–1927), was the acknowledged leader of the realist movement.

20TH CENT. The outstanding Danish poets in the pre-World War I era were Johannes V. Jensen (1873–1950) and Jeppe Aakjær (1866–1930), both masters of lyric verse. In the interwar period Tom Kristensen (b. 1893), Harald Bergstedt (b. 1877), and Nis Peterseff (1897–1913) emerged as major poets. Influenced by the French symbolists, Kai Friis Møller (1888–1960) and Paul la Cour (1902–66) also made their reputations during this period. Among the new voices 1st heard after World War II, the lyric poet Ola Sarvig (b. 1921) may be singled out.

The 20th-cent. Danish novel flowered brilliantly in the fiction of Martin Andersen Nexø (1869–1954) and the poet Johannes V. Jensen, both realists working in the epic manner. After World War I, Jacob Paludan (b. 1896) and H. C. Branner (b. 1903) established themselves as significant psychological novelists. At the same time Karen Blixen (pseudonym Isak Dinesen, 1885–1962), a subtle ironist of international stature, came to the fore. In the post-World War II era, Erik Aalbæk Jensen (b. 1923) and Hans Jepsen (b. 1920) have made names for themselves.

LOW COUNTRIES

The Netherlands

18TH CENT. Imitations and translations of the French neoclassical literature dominated Dutch letters in the 18th cent. Exceptions to this situation were the realistic novels of Elisabeth Wolff-Bekker (1738–1801) and the preromantic poetry of Antony Staring (1767–1840).

19TH CENT. Romanticism in the Netherlands expressed itself through a movement called *revue*, 1830–50. After a subsequent period of decline, a new renaissance blossomed, bringing with it such figures as the poet Willem Kloos (1859–1938). Standing apart from these trends was Eduard Douwes Dekker (1820–87), who, using the pseudonym Multatuli, produced *Max Havelaar*, 1860, a novel

protesting Dutch treatment of the Javanese.

20TH CENT. Impressionistic verse, dominant in the 1890's, gradually gave way to a more reflective and symbolic poetry, as in the works of Frederik van Eeden (1860-1932) and Albert Verwey (1865-1937). Also of importance were the surrealist Martinus Nijhoff (1894-1953) and the formalist Gerrit Achterberg (b. 1905).

•The Dutch novel reached greatness in the naturalistic work of Louis Couperus (1863-1923). Following World War I a reaction against naturalism brought to the fore Arthur van Schendel (1874-1946), who emphasized spiritual struggles. A more recent novelist of genius is Simon Vestdijk (b. 1898).

Belgium

18TH CENT. Among 18th-cent. Belgian writers working in Flemish, the neoclassical essayist Karel Broeckhaert (1767-1826) and the poet P. J. de Borchgrave (1758-1819) are 2 names that stand out. Among French-speaking writers in Belgium during this period, Prince Charles Joseph de Ligne (1735-1814) is remembered for his charming essays and memoirs.

19TH AND 20TH CENT. Flemish literature in the 19th cent. produced only 1 important poet, Guido Gezelle (1830-99), and 1 memorable novelist, Hendrik Conscience (1812-83). But out of a revival at the turn of the century the novelist and essayist August Vermeylen (1872-1945) emerged and inspired such writers as the novelist Herman Teirlinck (b. 1879) and the poet Karel de Wostijne (1879-1929). Following World War I, successive waves of antitraditionalism, idyllic pastoralism, and naturalism swept through Flanders. Around 1930 the formalistic work of poets like Bert Decorte (b. 1915) began to appear. Among post-World War II authors of particular merit is Louis-John Boon (b. 1915).

Except for the great novelist Charles de Coster (1827-79), French writing in Belgium languished during the 19th cent.

until about 1880. At that time it experienced a rebirth under the leadership of Max Waller (pseudonym of Maurice Warlomont, 1860-89). The most significant poet to reach fame during this period was the symbolist Maurice Maeterlinck (1862-1949). In the years preceding World War I the impact of Maeterlinck's symbolism showed itself in the melodious verse of Albert Mockel (1866-1945). During the interwar period French novelists sought to break away from localism and universalize their fiction. Among the more successful were André Baillon (1875-1932), John Tousseul (pseudonym of Olivier Degee, 1890-1944), and Georges Simenon (pseudonym of Georges Sim, b. 1903).

EASTERN EUROPE

Finland

19TH CENT. Finland's 1st modern author of significance was Aleksis Stenvall (pseudonym Aleksis Kivi, 1834-72), whose novels and plays blend humor and psychological realism. Simultaneously, the art of poetry in Finland was advanced by A. Oksanen (pseudonym of August Engelbert Ahlquist, 1826-89). In the 1880's, 2 major novelists appeared, Minna Canth (1844-97) and Juhani Aho (pseudonym of Juhani Brofeldt, 1861-1921).

20TH CENT. At the turn of the century neoromanticism flourished in the lyric poetry of Eino Leino (pseudonym of Armas Eino Leopold Lonnbohm, 1878-1926), the finest Finnish poet of modern times. Leino's 3 closest rivals for this honor are Larin Kyosti (pseudonym of Kaarlo Kyosti Larson, 1873-1948), Otto Manninen (1872-1950), and Veikko Antero Koskenniemi (1885-1962). Among recent poets, Kaarlo Sarkia (1902-45) and Aaro Hellaakoski (1893-1952) are especially noteworthy.

While poetry was embracing romanticism, the novel was moving in another direction, toward the naturalism of Itmari Kianto (b. 1874) and Joel Lehtonen (1881-1934). Of the same generation but less realistic in approach, Aino Kallas

(1878–1956) produced memorable work in the novel and short-story forms. Frans Eemil Sillanpää (b. 1888) holds the distinction of being the only Finn to win a Nobel prize for literature, 1939. The best-known Finnish writer outside Finland is Mika Waltari (b. 1908), whose novel *Sinuhe, egyptiläinen*, 1945, became famous in English translation as *The Egyptian*. Of greater stature than Waltari, however, is the untranslated Volter Kilpi (1874–1939).

Poland

18TH AND 19TH CENTS. The impact of French neoclassicism is clearly discernible in 18th-cent. Polish letters, especially in the poetry of Ignacy Krasicki (1735–1801) and Stanisław Trembecki (c. 1740–1812) and in the verse dramas of Franciszek Zablocki (1750–1821). Romanticism in Poland, emerging during the period of Russian domination, took the form of impassioned patriotism. The greatest of the romantic poets was Adam Mickiewicz (1798–1855). The Polish novel flowered most impressively after the rise of realism in the works of Bolesław Prus (pseudonym of Aleksander Głowacki, 1847–1912). At the same time, Henryk Sienkiewicz (1846–1916) became known throughout Europe for his historical novels.

20TH CENT. At the end of the 19th cent. a reaction against realism set in, resulting in the symbolist movement known as "Young Poland." The outstanding poet of this school was the "decadent" Kazimierz Tuwim (1865–1940). But for pure poetic skill Tuwim was easily surpassed by Jan Kasprowicz (1860–1926), a lyric poet employing predominantly religious themes.

Polish independence, 1918, brought a new surge of poetic activity. The Skamandrite school cultivated bizarre new forms and irregular verse, which it used for exultantly patriotic themes. Julian Tuwim (1894–1953) was the leading figure. A still more radical school, the *Vanguards*, demanded the complete abolition of all old forms and traditions; the

verse of Tadeusz Peiper (b. 1891) is typical of this school. During this era the great dramatic poet Karol Rostworowski (1877–1938) also emerged.

Among modern Polish novelists, few have attained greater stature than Stefan Żerowski (1864–1925), a master of social protest, and Władysław Reymont (1867–1925), who recorded peasant life in epic terms. In the newly independent Poland, fiction was mainly realistic. Zofia Nałkowska (1884–1954), Marja Dąbrowska (b. 1892), Józef Wittlin (b. 1896), and Michał Choromański (b. 1904) made important contributions to the novel of realism. An antirealistic strain existed also, however, as exemplified in the novels of Juliusz Bandrowski (1885–1944) and Stanisław Witkiewicz (1885–1939), where the subject matter is often distorted almost to the point of surrealism. Historical novels were not without adherents; the best of them was by Zofia Kossak-Szczucka (b. 1890). During World War II much writing flowed up from the underground and the postwar period has seen a certain amount of literary productivity, most of it the socialist realism encouraged by the Communist rulers.

Czechoslovakia

18TH AND 19TH CENTS. Relatively little was produced in the way of literature in the 18th cent., although the enlightened scholarship of Josef Dobrovský (1753–1829) laid the foundations for the renaissance that was to come. Swelling powerfully in the 19th cent., this national revival reached its height in the romantic poets Karel Hynek Mácha (1810–36) and K. J. Erben (1816–70). Among novelists the quasi-realistic works of Božena Němcová (1820–62) have retained their appeal. A 2nd wave of romanticism, flowing from France after 1870, produced the lofty poetry of Jaroslav Vrchlický (1852–1912).

20TH CENT. The 20th cent. ushered in for Czechoslovakia a cultural revolution led by T. G. Masaryk (1850–1937), aimed at freeing the country from German influence. Out of this movement came Petr Bez-

ruč (pseudonym of Vladimír Vašek, b. 1867) and R. X. Salda (1867–1937), who stressed the moral, reformative function of poetry. But the greatest poet of the period was Antonín Sova (1864–1928), a symbolist. He was followed by the mystic Otakar Březina (pseudonym of Václav Jekavý, 1868–1929), the "decadent" Jiří Lvovic (pseudonym of Josef Jiří Antonín Karásek, 1871–1951), and the realist Stanislav Neumann (1875–1947), a champion of vitrism. During World War I proletarian poetry was popular, but in the late 1920's and 1930's many poets turned away from social realism to surrealism. The leader of this movement was Vítězslav Nezval (b. 1900). Neoromanticism also sprang up in such poets as Martin Rázus (1888–1937).

Modern Czech fiction has chosen various modes. Vitalism produced the impressionistic novels of Fráňa Šrámek (1877–1952), while realistic writing was well represented by Josef Holeček (1853–1929) and Teréza Nováková (1853–1912); the latter documented peasant life vividly. Realism shaded into naturalism in the works of Karel Čapek-Chod (1860–1927), which describe middle-class life in Prague. Satire, too, was employed effectively by Czech writers, first by Viktor Dyk (1877–1931) at the turn of the century, later by Karel Čapek (1890–1938) and Jaroslav Hašek (1883–1923), whose novel *The Good Soldier Schweik* is an international favorite.

Hungary

18TH AND 19TH CENT. The beginning of a great revival of Hungarian culture dates from the 18th cent., when such emerging figures as Ferenc Kazinczy (1759–1831) fought for the readoption of the Hungarian language, long neglected by the ruling Hungarian nobility, who had written in German or Latin. In the following century, with this revival at its height, nationalism shaped the most characteristic literature, the poetry of Sándor Petöfi (1823–49), János Arany (1817–82), and Mihály Vörösmarty (1800–55). In fiction, the historical novelist Mór Jókai (1825–1904) was pre-eminent.

20TH CENT. After the turn of the century a great revival took place in Hungarian letters, partly spurred by the vigorous periodical *A Het* (*The Week*). In 1906 the lyric poet Endre Ady (1877–1919) burst into the literary world and quickly gained recognition as a major figure. Left-wing verse found a home in the new journal *Nyugat* (*The West*). The interwar period was an especially rich one for Hungarian poetry, boasting as it did the militant verse of Attila József (1905–37) and the religious poetry of László Mész (b. 1895). Little verse of importance was written in Hungary during World War II, but since then at least one voice has been heard, that of Gyula Illyés (b. 1902).

Modern Hungarian fiction began with *A Het*, where such writers as Zoltán Ambrus (1861–1932) appeared. Among novelists of this era, the greatest is Zsigmond Móricz (1879–1912), whose novels are realistic portraits of provincial life. Also of significance is Frigyes Karinthy (1888–1938). Generally speaking, the new wave in Hungarian writing was represented by the *Nyugat* group, which eventually gained recognition. However, the novelist Dezső Szabó (1879–1915) is a solitary giant, as is Lajos Kassák (1887–1967), a chronicler of the proletarian world. In the interwar period memorable fiction was written by Lajos Zilahy (b. 1891) and Sándor Márai (b. 1900), who depicted middle-class life; Pál Szabó (b. 1893) and József Darvas (b. 1912), masters of social realism; and Péter Veres (b. 1897), who championed the cause of the peasants. Since the war social and economic forces have been emphasized in literature. Tibor Déry (b. 1894) has acquired the greatest reputation.

Rumania

18TH AND 19TH CENT. The outstanding literary figures in 18th-cent. Rumania were the scholars Dimitrie Cantemir (1673–1723) and Ion Neculce (1672–1745). Toward the end of the century a Latinist movement, attempting to establish the Latin origins of the

Rumanian language, sprang up. It spurred much literary activity in the following century, including the lyric poetry of Mihail Eminescu (pseudonym of Mihail Eminovici, 1850-89) and the fiction of Ion Creangă (1837-89).

20TH CENT. An interest in folklore can be discerned in the poetry of Octavian Goga (1879-1938). Occidental influences were apparent in the symbolist poetry of I. Minulescu (b. 1881). Following World War I, the key poetic figures were the philosophical Lucian Blaga (b. 1895) and the lyrical Tudor Arghezi (b. 1880).

Rumanian fiction grew to prominence with the novels of Liviu Rebreanu (?1885-1913). Rebreanu was followed by such regional novelists as Cezar Petrescu (b. 1892), G. Mihaescu (b. 1891), and, most notably, the Transylvanian I. Agarbiceanu (b. 1892).

Yugoslavia

18TH AND 19TH CENTS. In the 18th cent. the ideas of the Enlightenment were developed steadily by the Serbian scholar Dimitrije Obradović (?1712-1811), the Croat satirist Matija Reljković (1732-98), and the Slovene poet Valentin Vodnik (1758-1819). In the 19th cent. the growth of the area's literature was inextricably bound up with the awakening of national consciousness, folk poetry, and western romanticism. The foremost romantic was the poet Sima Milutinović-Sarajlija (1791-1847). Realism followed, bringing with it the novelist Laza Lazarević (1851-90).

20TH CENT. Expressionist, surrealist, and symbolist influences are discernible in Yugoslav poetry after 1900. Among the leading poets are the Serbs Milan Rakić (1876-1938) and Aleksa Santić (1868-1924), the Croats Vladimir Nazov (1876-1919) and Vladimir Vidrić (1875-1909), and the Slovenes Oton Župančič (1878-1949) and Alojz Gradnik (b. 1882).

Fiction has not kept pace with poetry. Nevertheless, important work has been done by the Nobel prize winner Ivo Andrić (b. 1892) in Serbian, Vjekoslav Kaleb (b. 1905) in Croatian, and V.

Levstik (1886-1957) in Slovene. Other writers of importance are Krleža, Čopić, and Davičo. The Macedonian language has also developed a unique literature, in which the novelist Slavko Janevski is a central figure.

Greece

18TH CENT. Literary activity was not great during the 18th cent., due to Turkish control of Greece. However, the dactylic verse of Karamos Dapontis (1714-71), the patriotic poetry of Rhigas (1757-98), and the anacreontic efforts of Ioannis Vilaras (1771-1823) are worthy of note. In prose, important efforts at linguistic reform (anticipating later developments) were made by Adamantios Korais (1718-1833).

19TH CENT. In the aftermath of the revolution of 1821, the deeply patriotic Ionian school sprang up; its chief representatives were Andrea Kalvos (1796-1869) and Dionysios Solomos (1798-1857). In the 2nd half of the century, romanticism found an uninhibited voice in the Athenian poets of that period, but subsequently a new antnromantic school appeared in Athens, headed by Kostas Palamas (1859-1913). Allied with Palamas was Jean Psychari (Ioannes Psychares, 1851-1929), who revolutionized the Greek written language by his use of the vernacular.

20TH CENT. The pre World War I period was marked by 3 major poets: Konstantinos Kavafes (1863-1933), a prophet of disillusionment and despair; Angelos Sikelianos (1881-1951), a melodious and powerful mystic; and Kostas Varnales (b. 1881), a Marxist with a deep sense of tragedy. After the war a group of disillusioned surrealist poets appeared, most notably Georgios Seferes (pseudonym of Georgios Sefernades, b. 1900).

Modern Greek prose lagged behind poetry until after World War I, although the prewar era produced such figures as Kostas Theotokas (1872-1923), who perfected the novel of social criticism, and Konstantinos Christomanos (1887-1911), a refined and subtle stylist. The greatest

writer of this period was Gregorios Xenopoulos (1867–1951), a psychological novelist. During the interwar period several major authors* emerged, among them Angelos Terzakes (b. 1907) and Elias Venezes (b. 1903). Nikos Kazantzakis (1885–1957), also a poet, gained an international reputation with novels like *Zorba the Greek*, 1943, and *The Last Testament of Christ*, 1960.

HEBREW AND YIDDISH

Hebrew

18TH AND 19TH CENTS. Beginning in 1750, a great renaissance in Hebrew letters swept Jewish communities in Europe. Known as Haskalah, this movement was initiated, by Moses Mendelssohn (1729–86) and his disciples. Its influence was felt by Jews in Russia, Galicia, Germany, Italy, and elsewhere. In the 19th cent. it produced such poets as the contemplative Abraham Dob Lebensohn (1791–1879) and the fiery Jehuda Leb Gordon (1830–92). The 1st great novelist of the Haskalah was Abraham Mapu (1808–67), author of several historical novels. Mapu was surpassed, however, by Perez Smolenskin (1842–85), whose powerful novels depicted contemporary Jewish life. Among other writers of importance were Mordecai Feiberberg (1874–99) and Judah Steinberg (1863–1908).

20TH CENT. At the close of the 19th cent. new spirits of realism and nationalistic yearning became pronounced in Hebrew letters. Among contemporary Hebrew poets, these trends can be seen clearly in the verse of Saul Chernikovsky (1875–1943), Jacob Kahn (b. 1881), and Jacob Fichman (b. 1882). Chernikovsky, the best of the 3, recreated Russian village life in striking Biblical language. Also of significance was C. N. Bialik (1873–1934), who gave memorable expression to the search for a modern Jewish identity. Later poets worthy of mention are Rachel (R. Blovsein, 1890–1931) and A. Shlonsky (b. 1900), a symbolist.

An emphasis on the Hebrew past had characterized much of the Haskalah lit-

erature. *Fin-de-siècle* and 20th-cent. writers abandoned this emphasis and turned their attention to modern Jewish life. Under the influence of the Yiddish novelist Mendele such writers as Ahad Haam called for a modern Hebrew culture centered in Palestine. Realistic short stories of high quality were produced by I. H. Brenner (1881–1921), G. Schofmann (b. 1880), and U. N. Gessin (1880–1913), all emigrants whose work is pervaded by a rootless melancholy. In Palestine there was a good deal of literary activity; the novels of A. A. Kabak (1881–1944) portray pioneer life there, and the Nobel prize winner S. J. Agnon (b. 1880), perhaps the greatest of modern Hebrew writers, has set his scenes in the Holy Land. Hebrew literature has continued to thrive in the state of Israel and has become more colloquial and cosmopolitan. In the U.S. a substantial body of Hebrew writing has arisen, most notably the poetry of Simon Halkin (b. 1899) and Eisig Silberschlag (b. 1903), the fiction of Abraham Shoar (1869–1939), and the essays of Abraham Goldberg (1883–1942).

Yiddish

The fountainhead of modern Yiddish literature is Mendele Mokher Sefarim (Sholem Abramovitch, 1836–1917), whose novels and stories drew a realistic portrait of Jewish life in Russia. Mendele was followed by the greatest of Yiddish humorists, Sholem Aleichem (Solomon Rabinowitz, 1859–1916), who successfully blended humor and pathos. Contemporaneously, the short-story writer and playwright I. Leibush Peretz (1851–1915) brought a new universality to Yiddish letters. Among Peretz' disciples were Sholem Asch (1880–1957) and Abraham Reisen (1876–1953). Other Yiddish writers of prominence in the 20th cent. are Der Nister (pseudonym of Pinchas Kahanovitch (1885–1948) in the Soviet Union and David Pinsky (1872–1959), Joseph Opatoshu (b. 1886), and the poet Morris Rosenfeld (1862–1923) in the U.S. The best-known novelist now writing in Yiddish is probably Isaac Singer (b. 1904).

CHINA

18TH CENT. Antiquarian trends were powerful in the Chinese literature of the 18th cent., with writers striving to imitate the great classical and medieval works. Especially praiseworthy is the fiction of Wu Ching-tzu (1701-54) and Ts'ao Chan (?1715-63), author of the famous *Hung Lou Meng* (*Dream of the Red Chamber*), a tragic love story written in the vernacular.

19TH CENT. With the opening of China to western influence, translations from European languages soon became common. Yen Fu (1852-1921) and Lin Shu (1852-1924) did especially memorable work in the field of translation. Among creative writers western models were widely imitated. The spoken rather than the literary language was adopted by the poet Huang Tsun-hsien (1815-1905), who made extensive use of folk songs and foreign materials. In prose, the leading figure was Liu E (1857-1909), whose *Lao Ts'an Yu Chi* was the most important in a series of picaresque novels.

20TH CENT. An ardent supporter of Huang Tsun-hsien, Liang Ch'i-ch'ao (1873-1929) carried on the modernization of Chinese literature by cultivating a more flexible prose style and by introducing foreign expressions. This set the stage for the Literary Revolution of 1917, an antitraditional movement which championed the vernacular over the classical language and called for a new literature. The chief "revolutionary" was Hu Shih (b. 1891), whose persuasive articles appeared in the journal *Hsin Ch'ing-Nien* (*The New Youth*), edited by another key figure, Ch'en Tu-hsiu (1879-1942). With the publication of Hu Shih's masterful *Chung-kuo che-hsueh Shih Ta-Kang* (*Outline History of Chinese Philosophy*), 1919, the Literary Revolution gained victory. The spoken language, *pai-hua*, became the accepted form of literary and journalistic expression. Among the poets to adopt *pai-hua* was Kuo Mo-jo (b. 1891), whose Marxist leanings were typical of the new writers. The outstanding

fiction of the period was written by Lu Hsun (pseudonym of Chou Shu-jen, 1881-1936), author of the famous story "The Diary of a Madman." Other writers of importance were Chou's brother, Chou Tso-jen (b. 1885), Mao Tun (b. 1896), and the woman novelist Ting Ling. Realism was the dominant trend in all these authors.

Under the rule of the People's Republic, Chinese literature has been strictly controlled through the Chinese Writers' Union, which tolerates little deviation from Marxist theories of art. In poetry the use of classical forms has been discouraged; in fiction socialist realism is the official mode of expression. Nevertheless, poetry of considerable merit has been written under the Communists, notably by Ko Pi-chou and by the party chairman himself, Mao Tse-tung (who has to a great extent ignored his own interdiction of classical form). In the genre of the novel, Chai Li-po (b. 1908) has excelled with such works as *Great Changes in a Mountain Village*, 1958.

JAPAN

18TH AND 19TH CENT. The period 1700-1850 represented the culmination of a great renaissance in Japanese letters which had begun in the 1630's. Old verse forms such as the *tanka* were employed with great success by poets like Motoori Norinaga (1730-1801). Adapting the *tanka* to realistic subject matter, Okuma Kotomichi (1798-1868) and Tachibana Akemi (1812-68) broke new ground. At the same time, the *haiku* became a major genre in the hands of such new masters as Kobayashi Issa (1763-1827). In fiction, the 18th cent. produced such new forms as the *sharebon* (wit book) and *kokkeibon* (comic book). Jippensha Ikku (1765-1831) was a master of the latter mode. After 1800 the novelist Takizawa Bakin (1767-1848) made his mark. From 1853 on, western influences left their impact; the *tanka* and *haiku* were modernized by poets like Masaoka Shiki (1867-1902). In the 1880's translations of European narrative poems encouraged the Japanese to

attempt poetry of unusual length. Meanwhile, a realistic brand of fiction developed in the works of Furubatei Shimei (1864-1909) and Natsume Sōsōki (1867-1916).

20TH CENT. The popularity of free verse and symbolist poetry after 1900 bore witness to continuing western influence. More traditional in its approach was the Asakasha school, founded near the end of the 19th cent. and including among its members Ono Shibusaburo (1876-1957) and Sasaki Nobutsuna (1872-1963). Opposed to the Asakasha group was the Shinshisha school, calling for a new naturalistic verse that utilized the vernacular. Its leading figures were Yosano Tekkan (1873-1935), his wife Akiko (1878-1942), and Ishikawa Takuboku (1885-1912). Still another school of poetry that sprang up was the Negishi, which called for classical restraint and propriety. Masaoka Shiki was the founder of this group and Saito Mokichi (1882-1953) one of the chief members. Ranged against the Negishi were numerous younger poets of a revolutionary bent who sought to abandon all traditions. Kawahigashi Hekigodo (1873-1936) was the most famous of these young insurgents.

In fiction, a vast profusion of movements appeared after 1900. The realistic novel found able exponents in Tayama Katai (1871-1930), Masamune Hakucho (1879-1962), Kikuchi Kan (1888-1948), and, more fiercely, in the proletarian novels of Kobayashi Takiji (1903-33). Simultaneously, idealism was cultivated by Koda Rohan (1867-1947) and Tokutomi Roka (1868-1927), and by the Mita school, whose outstanding representative, Nagai Kafu (1879-1959), produced many brilliant portraits of the theatrical world in Tokyo. The idealists represented a more subjective, aesthetic approach to literature; some of them, notably Yokomitsu Riichi (1898-1947), became known as "neo-sensualists." Extending these trends even further, Tanizaki Jun-ichiro (1886-1965) advocated art for art's sake. Also a deeply subjective writer, Shiga Naoya (b. 1883) developed a loosely constructed autobiographical form called the "I novel," which has been widely adopted in modern Japan. From the younger generation have come such new

voices in fiction as Dazai Osamu (1909-48) and Mishima Yukio (b. 1925). In 1964 Hiraoka Kiwitake (b. 1925) created a stir with the novel *The Sailor Who Fell from Grace with the Sea*.

INDIA

19TH CENT. The impact of English culture wrought profound changes in Indian literature. New forms were introduced, such as the novel and the short story, and numerous European authors were translated. Before these revolutionary changes exerted their effect, classical literature had been the dominant force, imposing on the writer a rigid series of conventions and a fixed literary language. Prose was not used as a literary medium, and poetry was expected to deal exclusively with religious and mythic subjects. In addition, the metrical schemes used in poetry were highly standardized. But all these traditions were discarded by progressive 19th cent. writers, who adapted the vernacular, experimented with new meters and new forms, turned from religious to secular subjects, cultivated the novel, and used literature as a vehicle for social commentary.

20TH CENT. In the 20th cent. the demand for independence became a major literary theme. At the same time, the short story surpassed the novel in its appeal, and Indians assiduously studied European masters of this form. Generally speaking, the focus of attention in both novels and short stories was on economic and social injustice—against a backdrop of swelling patriotism. Once independence had been achieved, however, Indian literature was faced by a new problem: the immense diversity of languages and dialects, which prevented the creation of a truly national literature.

HINDI. The well-known journal *Saraswati* was a seminal force in modern Hindi literature, encouraging many young writers. *Saraswati's* editor, Mahaviprasad Dwivedi (1868-1938), was also noteworthy for promoting a modernized version of Hindi. The way was then clear for Prem Chand (1880-1936), who became the leading Hindi novelist with such

works as *Godan* (*Godān*), 1935. Also of impressive stature is Ilachand (Ilāchand) Joshi (b. 1902), a Freudian writer.

The 1st modern Hindi poet of importance was Bharatendu Harishchandra (1850-83). In 20th-cent. poetry, aestheticism was represented by Surykant Tripathi (1896-1961), social criticism by Yashpal (b. 1904), and experimental verse by S. H. Vatsyayan (known as Ajney, b. 1911).

URDU. The father of modern Urdu is Sir Sayyid Ahmad Khan (Khān) (1817-98), who organized a movement aimed at adapting western ideas to Islamic culture. In poetry the 1st modern figure was Mirza Ghalib (Ghālīb) (1797-1869), while Anis (1801-74) proved himself a master of older forms. Soaring beyond these 2 (and all other rivals) Mohammed Iqbal (Muhammad Iqbāl) (1873-1938) has taken his place as the greatest of Urdu poets.

Urdu prose found gifted practitioners in Altaf Hali (Altāf Hālī) (1837-1914), biographer, poet, and critic, and in Sarshar (Sarshār) (1846-1902), the novelist of Lucknow. After 1900 Prem Chand, who also wrote in Urdu, established himself as a major novelist and short-story writer.

BENGALI. Modern Bengali poetry began in the 1860's with the introduction of such metrical innovations as blank verse. The guiding figures in this movement were Michael Madhu Sudan Dutt (1824-73), Rangalal Bandyopadhyay (Rangalāl Bandyopādhyāy) (1826-77), and, most notably, Hemcandra Bandyopadhyay (Bandyopādhyāy) (1838-1903). Among recent poets Buddhadeva Bose (b. 1908) has produced much excellent work.

Modern Bengali prose dates from the journalistic work of men like Ishwar-chandra Gupta (1806-58) in the 1830's. Their renovation of Bengali prepared the way for the unsurpassed fiction of Bankim Chandra Chatterji (1838-94) and the world-famous Rabindranath Tagore (1861-1941). Later writers of high achievement include Bibhuti Bhushan Banerjee (1896-1950) and Annada Sanka Roy (b. 1904).

GUJARATI. The modernization of Gujarati poetry and prose began with Narmadashankar (1833-86). Subsequent poets of impressive achievement were

Narsimhrao Divatia and Kavi Nanalal Dalpatram. Gujarati prose reached its peak in the novel *Sarasvatīcandra* (*Sarasvatīcandra*) by Govardhanram Tripathi (1855-1907) and in the works of K. M. Munshi (b. 1887) and Mohandas K. Gandhi (1869-1948).

MARATHI. Keshavsut (Krishnaji Keshav Damle, 1866-1905) is generally considered the father of modern Marathi poetry. In the 20th cent. the poetry of Bhaskar Ramchandra Tambe (1874-1941) is especially memorable. Marathi fiction came of age with the novelist Hari Narayan Apte (1864-1919) and further developed in the hands of Vaman Joshi (1882-1943) and of the outstanding short-story master Vishnu Sitaram Phadke (b. 1898).

A certain amount of literary activity has also taken place in the other Indo-Aryan languages: Assamese, Kashmiri, Oriya, Panjabi.

DRavidIAN LITERATURE. Dravidian literature has followed roughly the same course of modernization as the Indo-Aryan tongues: the use of nationalism as a literary theme, the adoption of the colloquial idiom, etc. The languages with the most extensive literatures are Tamil, Kanarese, Telugu, and Malavalam.

LITERATURE IN ENGLISH. Among the numerous Indian poets who have written in English are Sarojini Naidu (1879-1949), an ardent nationalist, and Sri Aurobindo (Aurobindo Ghose, 1872-1950), whose religious writings include an epic in blank verse. Modern Indian fiction in English has produced such outstanding works as *Coolie*, 1936, by Mulk Raj Anand (b. 1905) and *The Guide*, 1958, by R. K. Narayan, (b. 1906).

SOUTHEAST ASIA

BURMA. Modern Burmese literature dates from the introduction of western printing methods, c. 1875. Around the turn of the century the novel became an accepted literary form, and such writers as U Kyi and U Lat quickly made their mark. The foundation of the University of Rangoon, 1920, stimulated further literary activity. Fiction remained the domi-

'nant genre, and in 1936 *Tet Hpon-gyi* (*The Modern Monk*) by Thein Pe made a tremendous impact. Burmese independence, 1948, added a strongly nationalistic impulse to literature. Recent writers in whom this strain is pronounced are Min Aung and Ja-nè-gyaw Ma Ma Lay.

THAILAND. In the early part of the 19th cent., King Rama II produced a number of notable poetic works, chiefly romances in the traditional manner. *Pra Abhaimani*, by Soutorn Bhu, is a memorable fantasy also written during this period. After 1850 prose became a major form of literary expression. At the same time, court poetry continued to be written by such figures as Prince Bidyalongkorn, Jit Buradat, and King Chulalongkorn. The poem *Talengpai*, by Prince Paramanujit, has earned its author a high place in modern Thai poetry. Novelists of significance are Dokmaiso and Kukrid-dhi, author of *Phaiden* (*The Red Bamboo*).

INDONESIA. Contemporary Indonesian literature takes in a multiplicity of attitudes and styles. Among the writers working in Djakarta, eastern and western influences clashed sharply. Of this group Amir Hamzah became the leading poet in the 1930's and Armijn Pané the leading novelist. Prose itself had only appeared as a literary form in the 1920's with writers like Merari Siregar. An Islamic movement emerged in Medan, favoring extreme nationalism and calling for a religious revival. Simultaneously a Marxist school sprang up and produced a small body of proletarian literature. Among subsequent poets Chairil Anwar and Usmar Ismail displayed exceptional gifts. In the post-World War II period a new group of writers, known as the "generation of 1945," came into prominence. Some of this group's more outstanding members were Asrul Sani, Achdiat Mihadja, and Mochtar Lubis, whose novel *There Is No Tomorrow*, 1948, evoked much interest.

PHILIPPINES. The outstanding novel of the 19th cent. Philippines was *Noli me tangere*, 1886, by José Rizal. Since the turn of the century Filipino authors have increasingly used English as their literary medium.

AFRICA

19th Cent.

INFLUENCE OF MISSIONARIES. European missionaries played a crucial role in the growth of modern African literature by developing written languages where only oral ones had existed before and by introducing the printing press. The missionaries also made numerous western works available to Africans through translations. Naturally, the Bible and other religious writings were translated first. Deeply influenced by these materials, western-educated Africans began to produce hymns, parables, essays, and didactic verse. Also crucial in shaping the sensibility of modern African letters was Africa's rich tradition of oral literature: chants, tales, folklore, drum histories, praise songs, and the like. Among the more prominent literary efforts of the 19th cent. were Tiyo Soga's translation of *Pilgrim's Progress* into Xhosa; *The Song of the Cross*, a religious poem by H. M. Mthakathi; and the "Great Discussions" by William Gqoba.

20th Cent.

SOUTH AFRICA. Bantu languages like Tswana, Xhosa, Zulu, and Sotho have been extensively cultivated as literary media. Poetry, though not the dominant literary mode in South Africa, has found gifted practitioners in H. I. Dhlomo, S. E. K. Mqhayi, and B. W. Vilakazi, whose *Isabelo Seka Zulu KaZulu*, 1935, is one of the landmarks of Zulu poetry. Bantu fiction began with Thomas Mofolo (1873-1948), whose historical romance *Chaka* (translated into English in 1931) celebrates heroic aspects of the African past. Another distinguished figure is Solomon T. Plaatje, who compiled Tswana proverbs, translated Shakespeare's plays into Tswana, and produced a series of historical novels.

The best-known African writers in South Africa, however, Ezekiel Mphahlele and Peter Abrahams, both write in English. They have, moreover, discarded the

romantic tradition of Mofolo and Plaatje and replaced it with a fiction of social protest. This new realism is evident in Abrahams' impassioned novel *The Path of Thunder*, 1943, and Mphahlele's excellent short-story collection *The Living and the Dead*, 1961. Other writers of note are Alex La Guma and Richard Rive.

South African writers of European descent include Stuart Cloete, Nadine Gordimer, and Alan Paton. Paton will be remembered for his deeply felt novel *Cry, the Beloved Country*, 1948.

ENGLISH-SPEAKING WESTERN AFRICA. Poetry of excellence has been written in the Yoruba language by Ajayi Ajisafe and in English by the Nigerian Dennis Osadebay. Fiction is, however, the most popular literary genre. The father of Anglo-African literature in the region is Amos Tutuola, whose novel *The Palm-Wine Drinkard*, 1952, is widely read. Tutuola has been very successful at weaving folk tales and motifs into his works. Another Nigerian, Chinua Achebe, produced the powerful and celebrated novel *Things Fall Apart*, 1958, a study of the conflict between African custom and encroaching western patterns of life. After Achebe and Tutuola, 3 of the most respected West African writers are Cyprian Ekwensi, Wole Soyinka, and T. M. Aluko. In Sierra Leone, Abioseh Nicol has established himself as a leading short story writer. Among women authors Efua Sutherland of Ghana is noteworthy.

FRENCH-SPEAKING AFRICA. In contrast to the other regions of the continent, poetry is more popular in the French-speaking areas than fiction. The most distinguished poet is Léopold Senghor (b. 1906; president of Senegal, 1962), author of 5 vols. of highly polished French verse, the 1st appearing in 1945. Senghor spent his *Wanderjahre* in Europe, where he drank in western culture and blended it with a passionate need to assert his African heritage. This need expresses itself in the theme of *négritude*—the nature and beauty of blackness—which runs through his poetry. Léon Damas (b. 1912) of French Guiana served the same term of expatriation as Senghor and employs similar themes. Among the many

other African poets writing in French are Keita Fodeba of Guinea, Antoine Roger Bolamba of the Congo, and David Diop of Senegal.

The appearance of *Batouala*, 1921, by René Maran (b. 1887), which won the Prix Goncourt, marks the beginning of Afro-French fiction. Of no less importance is the Guinean Camara Laye (b. 1928), whose subtle allegory *Le Regard du roi*, 1951, is 1 of the masterpieces of African literature. Simultaneously, the Camerounian writer Mongo Beti made his mark, and another Camerounian, Ferdinand Oyono, has emerged as a gifted satirist.

PORTUGUESE-SPEAKING AFRICA. Literary activity in Portuguese-speaking Africa has resulted in a small body of work, mostly poetry. Among the chief characteristics of this poetry are a hatred of colonialism, a strong concern with social and economic problems, and the use of local dialects along with standard Portuguese. Oswaldo Alcantara, Onésimo Silva, and Antonio Jacinto are among the most noteworthy figures.

MIDDLE EAST

Arabic

19TH CENT. After several centuries of intellectual stagnation during the period of Turkish domination, Arabic literature began to revive during the latter half of the 19th cent. This renaissance stemmed from an invigorating contact with western culture; it resulted both in a revival of interest in classical Arabic literature and in an effort to modernize Arabic letters along western lines. The classical school was led by the Lebanese Nasif al-Yaziji (1800–1871), who published a skillful imitation of al-Hariri's 12th cent. *Maqamat* (*Maqāmāt*), a collection of picaresque stories. The modernization movement was spearheaded by the missionary schools, particularly in Beirut. Other cornerstones of modern Arabic literature were the publication of the 1st modern Arabic dictionary by Butrus al-Bustani (al-Bustāni) (1819–83); the introduction of printing presses and daily newspapers;

translations from European languages; and the founding of influential periodicals such as *al-Muqtataf* (*The Culled Ones*), 1877.

20TH CENT. Toward the end of the 19th and beginning of the 20th cent., western forms such as the novel, short story, and essay were adopted by Arabic men of letters. Poetry remained more closely bound by tradition. In contemporary literature the works of Tawfiq al-Hakim (b. 1902), an Egyptian novelist and dramatist, have won great praise. His satirical mystery *Yanmiyat Nā'ib fi al-Aryāf* (*The Diaries of a Country Magistrate*), 1937, is perhaps his best novel. Also of considerable importance is Taha (Tāhā) Husayn (b. 1889), another Egyptian, whose fiction and autobiography have been widely read. In the U.S. the Lebanese immigrant Kahlil Gibran (Jubrān Khālil Jubrān, 1883–1931) has become well known for his volumes of prose poetry (e.g., *The Prophet*).

Persian

19TH CENT. In Persia the story of modern literature has been much the same as in the Arabic countries: the

impact of the West, translation of European works, revived interest in the Persian classics, etc. In addition, Persian authors such as Qu'im Magam Farahani and Amir Kaoir revealed a commitment to social reform as early as the 1820's. In the following years the use of fiction as a medium for social commentary was further stimulated by James Morier's *Hajji Baba*, 1834. Among others, Zain al-Abidin (al-'Abidin) drew much inspiration from this work.

20TH CENT. The Persian renaissance continued after 1900, assisted by the publication of numerous classical works under government auspices. The press also contributed to the revival by helping to render the language more colloquial and more flexible. In poetry the 1st blows for modernist verse were struck by such figures as Adib i Pishavari and Iraj Mirza. Among the more conservative poets, Parvin i I'tisami was an outstanding figure. Left-wing verse was represented by Ishgi and, more recently, by Lahuti. In the post-World War II period the names of Mohammed (Muhammad) Hussein Shahriyar (b. 1904) and Parviz Natel Khanlari (b. 1914) have become well known.

The Theater

GREAT BRITAIN AND IRELAND

18TH CENT. In the 18th cent. the English theater boasted several noteworthy figures, among them the novelist Henry Fielding (1707–54), who achieved both popularity and notoriety with such stinging political satires as *The Tragedy of Tragedies*, 1731. Another novelist (and poet), Oliver Goldsmith (1728–74), contributed one of the most entertaining comedies in the history of English drama, *She Stoops to Conquer*, 1773. However, the theater's most original genius during this century was Richard Brinsley Sheridan (1751–1816), whose polished, witty style cut deeply into the surface of upper-class hypocrisy. His gift for comic portraiture and command of the comedy of manners

is best seen in such works as *The Rivals*, 1775, and *The School for Scandal*, 1777.

19TH CENT. During the 1st half of the 19th cent., however, the English theater produced little of value. It was not until the appearance of T. W. Robertson (1829–71), with a series of relatively realistic comedies, that Victorian England had a playwright of even historical importance. More significant were the translations of Ibsen that began to appear in the 1870's, gradually stimulating an interest in the drama of social criticism. Out of this interest were born the "problem plays" of Arthur W. Pinero (1855–1934), which focused on current social issues. Meanwhile comedy began to flourish again in the clever *divertissements* of Henry Arthur Jones (1851–1929) and rose

to decisive greatness with the arrival of Oscar Wilde (1856-1900), whose deftness of situation and polished brilliance of dialogue are best exemplified in *The Importance of Being Earnest*, 1895, perhaps the finest drawing-room comedy ever written.

20TH CENT. Following the realistic tradition of Pinero, John Galsworthy (1867-1933) stressed social and economic problems in loosely constructed but moving plays. Simultaneously, Sir James M. Barrie (1860-1937) displayed his gift for charming, whimsical fantasy in such plays as *What Every Woman Knows*, 1908. The realistic, Ibsenite movement culminated in the towering genius of George Bernard Shaw (1865-1950). Brazenly didactic, Shaw bombarded his audiences with eloquent social protest and outrageous iconoclasm—though as often as not the playwright's iron hand came gloved in masterful wit and unrivaled command of rhetoric. His powers reached their pinnacle in *Man and Superman*, 1905, though lesser plays such as *Saint Joan*, 1923, and *Heartbreak House*, 1917, still raise him higher than any other English or Irish dramatist of the century.

Meanwhile a remarkable dramatic revival was under way in Ireland, where the Abbey Theater was founded in 1902. The Abbey mounted plays by W. B. Yeats, Lady Augusta Gregory (1859-1932), and, more notably, John Synge (1871-1909), whose *The Playboy of the Western World*, 1907, satirized Irish life in a kind of poeticized vernacular. There, too, the rough-hewn plays of Sean O'Casey (1881-1964) were performed (*The Plough and the Stars*, 1926).

After 1930 the quality and vigor of English drama fell off sharply. Exceptions to this were the smooth, craftsmanlike plays of Terence Rattigan (b. 1912) and the ambitious verse dramas of T. S. Eliot (who became a British subject in 1927). The best of Eliot's plays was *Murder in the Cathedral*, 1935. Following World War II a spirited revival in the British theater brought such "angry young men" as John Osborne (b. 1929) to the fore. *Look Back in Anger*, 1958, a furious broadside at the British Establishment, made Osborne world-famous. Still more

recently, Harold Pinter (b. 1930) has achieved success on both sides of the Atlantic with a series of plays that suggest undercurrents of horror beneath the conventional surface of life.

REPERTORY THEATER. England's repertory system is perhaps the most extensive in the world. Annie Horniman (1860-1937) founded the 1st modern English repertory theater in Manchester in 1907. At present there are about 50 such companies operating on a full-time basis; in the provinces one of the most respected of these is the Birmingham Repertory, founded in 1913. Generally speaking, a repertory company performs a play a week throughout the year; most British actors receive their early training in repertory. In London the major companies are the Royal Shakespeare, dividing its time between Stratford-upon-Avon and London, and the newly created, 1962, National Theater, subsidized by the government and under the direction of Sir Laurence Olivier (b. 1907).

UNITED STATES

DEVELOPMENT OF AMERICAN DRAMA. In the 19th cent. American drama was largely an imitative form, drawing both subject matter and technique from England. However, at the turn of the century a number of playwrights achieved conspicuous success on the American stage, among them W. V. Moody (1869-1910) and Clyde Fitch (1865-1909), the latter often having 2 or 3 hits running simultaneously. But American drama as a major art form arrived with Eugene O'Neill (1888-1953), whose plays, though often clumsy in language and construction, carried a full-blooded intensity that stunned audiences. A gloomy, morbid quality pervades all his work from *Beyond the Horizon*, 1920, the tragedy of a poetic dreamer, to *Mourning Becomes Electra*, a retelling of the *Oresteia*, to *The Iceman Cometh*, 1947, which deals with the inevitability of human illusion.

Although O'Neill bestrode the American theater for 3 decades, other playwrights reached considerable prominence

as well. In the 1920's Sidney Howard (1891-1955) came forward with *They Knew What They Wanted*, 1925. He was followed by Robert E. Sherwood (1896-1955), George Kelly (b. 1889), and Philip Barry (1896-1949). Elmer Rice (1892-1967) assured his place in American literature with the expressionistic *The Adding Machine*, 1923, and the naturalistic *Street Scene*, 1929. Next to O'Neill the best playwright of this period was Maxwell Anderson (1888-1959), who revived the verse play in such works as *Winterset*, 1935. In the 1930's a theater of social consciousness became popular, and gave rise to Clifford Odets (1906-63) and Sidney Kingsley (b. 1906). Also coming to the fore in the 1930's were Lillian Hellman (b. 1905) and Thornton Wilder (b. 1897), whose *Our Town* has become an American classic. The 1940's produced 2 dramatists who surpassed all predecessors except O'Neill: Tennessee Williams (b. 1915), author of *The Glass Menagerie*, 1947, and Arthur Miller (b. 1915), whose *Death of a Salesman* is of great distinction. Among the younger playwrights, Edward Albee (b. 1928) is the best known.

THEATERS AND DRAMA GROUPS.

The Theater Guild (founded in 1918) provided New York with a home for serious drama and helped spawn such figures as Eugene O'Neill and Maxwell Anderson. In spite of the impact of the depression, American drama continued to grow; the Group Theater, based on Stanislavski's acting system, was founded to cultivate new actors, and the Federal Theater Project created low-price theater for the mass audience. After World War II the Actors' Studio became famous for "method acting," a technique influenced by Stanislavski. New directors rose to prominence, among them Elia Kazan (b. 1909) and José Quintero. The expense of mounting Broadway productions stimulated the development of numerous "off-Broadway" theaters, e.g., the Circle in the Square, where revivals and less commercial plays could be produced. In recent years several repertory companies of note have appeared; the APA Co. in New York is the most widely admired.

MUSICAL COMEDY. The most original of American theatrical institutions is musical comedy, a unique blend of operetta, revue, and burlesque. *The Black Crook*, produced in New York in 1866, is generally considered to be the 1st musical. Among the subsequent landmarks are the sassy, infectious songs of George M. Cohan (1878-1942), the light operas of Victor Herbert (1858-1924), the witty, cosmopolitan lyrics of Cole Porter (1891-1964) and Lorenz Hart (1895-1943), the dynamic and inventive jazz rhythms of George Gershwin (1898-1937), and the sentimental but richly melodious shows of Richard Rodgers (b. 1902) and Oscar Hammerstein II (1895-1960). From the standpoint of musical sophistication and substance, Gershwin's *Porgy and Bess*, 1935, is probably the greatest work of this genre (though it is sometimes termed a "folk opera").

FRANCE

18TH CENT. The tragedies of Voltaire, lifeless imitations of Racine, dominated the French theater of the 18th cent., but quickly vanished from the boards with their author's death. Diderot also tried his hand at comedy with even less success. The only French playwright of lasting importance in this period was Beaumarchais (Pierre Augustin Caron, 1732-99), who achieved immortality with 2 ingenious comedies, *The Barber of Seville*, 1775, and *The Marriage of Figaro*, 1784, which served as the bases for operas by Rossini and Mozart, respectively. The same hero, a common barber, appeared in each, and his skillful handling of aristocratic intrigues represented to theatergoers a new and democratic, even revolutionary, note in French drama.

19TH CENT. The production of Victor Hugo's *Hernani*, 1830, inaugurated the romantic age in French drama. Classical rules of construction were abandoned, comedy and tragedy were mixed, and a new, extravagant emotionalism prevailed. Hugo's success was soon duplicated by Alexandre Dumas père (1802-70) in *La*

tour de Nesel, 1832, by Alfred de Vigny (1797-1863) in *Chatterton*, 1835, and by Alfred de Musset in *Lorenzaccio*, 1833. A reaction against the excesses of the romantics came with the "well-made plays" of Eugène Scribe (1791-1861), which limited themselves to light, amusing situations. In a broader vein Georges Feydeau (1862-1921) perfected the bedroom farce. Meanwhile, serious theater in the 2nd half of the century thrived on the plays of Alexandre Dumas fils (1824-95), Henry Becque (1837-99), and Émile Augier (1820-89). Problem plays, such as those of Eugène Brieux (1858-1932), introduced a new realism into the theater. But the outstanding playwright of the period was the anachronistic Edmond Rostand (1868-1918), an impassioned romantic, whose *Cyrano de Bergerac*, 1898, tempered poetry with wit in an exquisite blend.

20TH CENT. The forces that shaped contemporary French theater were gathering at the close of the 19th cent. Maurice Maeterlinck's symbolic dramas made their impact, and in 1896 Alfred Jarry (1873-1907) produced his *Ubu-Roi*, a violent, heavily stylized burlesque of French society. Often considered the 1st modern French play, it anticipated much of the experimental theater that was to follow. In the post-World War I era French drama came into full bloom with such figures as Jean Cocteau (1899-1963), a leading surrealist, whose *Orphée*, 1926, showed him at his best. Also part of the flowering was Jean Giraudoux (1882-1944), who adapted classical situations to modern themes with disarming adroitness (*La Guerre de Troie n'aura pas lieu*, 1935). More recently, Jean Anouilh (b. 1910) has also made use of ancient myths; his best work varies from tragedy to comedy and his interpretations of historical figures are striking. Of slightly less stature, Armand Salacrou (b. 1899) has cast his bitter anti-bourgeois vision in several notable satires.

Several French novelists have successfully adapted their talents to the theater, among them François Mauriac and Henry de Montherlant. During and after World War II existentialism invaded the theater through the works of Jean Paul Sartre (*Les Mains sales*, 1948) and Albert Camus

(*Caligula*, 1944). In the 1950's and early 1960's Samuel Beckett, an Irish dramatist writing in French, rose to prominence with such plays as *En attendant Godot*, 1952. The Theater of the Absurd, an antirealistic movement specializing in various forms of irrationalism, bubbled up in the exuberant comedies of Eugène Ionesco (b. 1912).

GERMANY

18TH CENT. The 1st German playwright of significance in the 18th cent. was Gotthold Lessing (1729-81), who left his mark on the theater of his time with the adept folk comedy *Minna von Barnhelm*, 1763, and the prose tragedy *Emilia Galotti*, 1772. Lessing was followed by Goethe, whose plays also had a tremendous impact on the drama of the period, though they survive more as literature than as theater. Among his more stage-worthy works are the domestic drama *Clavago*, 1774, and the tragedy *Egmont*, 1788. Better suited to the stage were the wild, romantic plays of Friedrich von Schiller, especially the prose melodrama *Die Räuber*, 1780-81, whose revolutionary fervor was imitated and echoed in the *Sturm und Drang* literature of the time. Schiller's most successful verse plays, the product of his later, classical period, were the tragedy *Don Carlos*, 1787, and the historical trilogy *Wallenstein*, 1798-99.

19TH CENT. In the 1st half of the 19th cent. the greatest German dramatists were Heinrich von Kleist, Franz Grillparzer (1791-1872), Friedrich Hebbel (1813-63), and Georg Büchner (1813-37), all tragedians. After 1850 the heroic operas of Richard Wagner (1813-83), especially the tetralogy *Der Ring des Nibelungen*, exerted a great force in the theater. From this pinnacle of romanticism the pendulum swing to naturalism was inevitable, and came with the social protest of Gerhart Hauptmann (1862-1946) in such dramas as *Die Weber*, 1892. Hauptmann's chief disciple, Hermann Sudermann (1857-1928), also made several notable contributions to naturalist drama.

20TH CENT. Sudermann and others carried naturalism into the 20th cent. (though Hauptmann himself abandoned it for various forms of experimental drama). However, in the post-World War I era expressionism came into the foreground, adopting an extreme form of symbolism and endeavouring to project states of mind into concrete externals. The leading expressionists were Georg Kaiser (1878-1945), whose *Von Morgen zu Mittag*, 1916, was produced throughout the world, Ernst Toller (1893-1939), and Frank Wedekind (1864-1918). Other dramatists who appeared in the 1st quarter of the century were Hugo von Hofmannsthal, author of several verse dramas, and Arthur Schnitzler, whose impressionistic "playlets" dwell on sexual impulses. Meanwhile, in the vibrant Berlin of the 1920's, the greatest German playwright of the century, Bertolt Brecht (1898-1956), appeared. His *epische Theater* was, in its efforts to instruct the audience, both antiromantic and anti-realistic. A confirmed Marxist, Brecht leavened his fine sense of theater with lectures on the corruption and dehumanization of class society. *Mutter Courage und ihre Kinder*, 1911, and *Das Leben des Galileo Galilei*, 1943, are among his best dramas.

In the period following World War II the most important work in German theater was done by 2 Swiss writers, the novelist Max Frisch and Friedrich Dürrenmatt (b. 1921). In 1962 Rolf Hochhuth, 1931, a German playwright, scored an international success with *Der Stellvertreter* (*The Deputy*), an attack on the papal policy toward Jews during World War II.

STAGING AND DIRECTION. The greatest director in modern German theater was without question Max Reinhardt (1873-1943), who departed from both the stiff, tradition-bound schools of acting and the new naturalistic movement. Between these 2 extremes Reinhardt found a middle way, which balanced color and theatricality with quasi-realistic acting styles. In the 1920's 2 of Reinhardt's followers, Leopold Jessner (b. 1878) and Erwin Piscator (b. 1893), helped to develop the new expressionist theater in

which stylization and symbolism predominated. After World War II Bertolt Brecht's theories of a didactic drama were pre eminent, and his company, the Berliner Ensemble (East Berlin), is still the most famous in Germany.

SOVIET UNION

PREREVOLUTIONARY DRAMA. Of the 4 best-known Russian playwrights from 1800 to 1850, 3—Pushkin, Lermontov, and Gogol—worked chiefly in other genres. The 4th, Alexander Griboyedov (1795-1829), produced the delightful comedy *Woe from Wit*, 1822. In the 2nd half of the century the dominant dramatist was Alexander N. Ostrovski (1823-86), whose tragicomedies portrayed the author's fatalistic view of life with uncompromising realism. Among other novelists who worked successfully in the dramatic mode were Turgenev and Tolstoy.

Breaking away from the declamation and bathos of the classical acting styles, Stanislavski (Konstantin Alekseyev, 1863-1938) founded the Moscow Art Theater, 1898. There he developed a new naturalistic acting technique in which performers were expected to plumb the depths of the characters they portrayed and bring out the spiritual essence of each. Stanislavski immediately found the ideal material for his purposes in the plays of Anton Chekhov (*Uncle Vanya*, 1900; *The Cherry Orchard*, 1904), tragicomedies in which the characters discover the impossibility of happiness and the inevitability of longing for it. Tragedy for Chekhov was a gradual abrasion rather than a sudden blow. His key disciple was the novelist Maxim Gorky, whose still more gloomy, naturalistic plays include the famous *The Lower Depths*, 1902.

POSTREVOLUTIONARY DRAMA. Under the Soviet regime dramatists, like other authors, have been expected to express the values and beliefs of Marxist ideology and to help to educate the masses. State support for the dramatic arts resulted in the construction of many new theaters and in the expansion of old ones. Of the prerevolutionary playwrights, those who

retained prominence were Gorky, Aleksei N. Tolstoy (1883-1945), and Anatol Lunacharski (1875-1933). Among the postrevolutionary figures were Aleksandr Afinogenov (1904-41), author of the propagandistic but penetrating *Fear*, 1930, and Nikolai F. Pogodin (1900-1962), whose didactic play *Tempo*, 1930, showed an understanding of mass psychology. During World War II patriotic anti-Nazi plays prevailed, the best of them being *The Russian People*, 1912, by Konstantin Simonov (b. 1915). Since the period of de-Stalinization began, greater freedom of artistic expression has been permitted, but no major dramatists have yet come forward.

ITALY

18TH AND 19TH CENTS. A great revival in Italian drama took place in the 18th cent., bringing to the fore the comic playwright, Carlo Goldoni (1707-93), and the tragedian, Count Vittorio Alfieri (1719-1803). Goldoni's droll portraits of native life resulted in such masterpieces as *Il Servitore di Due Patroni*. Alfieri projected his hatred of tyranny and his fiery patriotism into a series of preromantic tragedies, of which *Filippo*, 1787, is one of the best remembered.

During the *Risorgimento* patriotic dramas seemed to flow from every pen. The best of these nationalistic plays were those of Giovanni Niccolini (1782-1861), in which the author denounced tyranny and argued passionately for his country's unification. As the realistic movement engulfed Italian letters, a theater of social criticism began to appear, especially in the works of Fausto Martini (1886-1931), Giuseppe Giacosa (1817-1906), and Marco Paga (1862-1929), where adultery recurred as a major theme.

20TH CENT. At the turn of the century Roberto Bracco (1862-1943) became famous for his depiction of Neapolitan life. He was quickly eclipsed, however, by the poet and novelist Gabriele D'Annunzio, author of several spectacularly decadent and sordid dramas which won him a temporary international reputation. Also popular outside Italy,

chiefly for *La Cena del Beffe*, 1909, was Sem Benelli (1877-1949).

Both D'Annunzio and Benelli were overshadowed, however, by Luigi Pirandello (1867-1936), Italy's leading modern dramatist and a great force in the theater throughout the world. An intensely cerebral playwright, Pirandello challenged old assumptions about the sacredness of facts, arguing in his plays that truth is subjective and fragmentary. This point of view is set forth with particular ingenuity in *Così è (se vi pare)*, 1917. *Sei Personaggi in Cerca d'Autore*, 1921, which demonstrates the impenetrability of truth and illusion, is Pirandello's masterpiece. The only recent Italian dramatist to approach major stature is Ugo Betti (1892-1953), whose plays concern themselves with the problems of moral responsibility.

SPAIN

19TH CENT. Romanticism invaded Spanish drama through the works of Francisco Martínez de la Rosa (1789-1862), Antonio García Gutiérrez (1813-81), and José Zorrilla y Moral (1817-93), whose play *Don Juan Tenorio*, 1844, is still performed. In the 1870's a wave of realism began to wash over Spanish drama. In *El Hijo de Don Juan*, 1892, the romantic José Echegaray y Eizaguirre (1832-1916) successfully mixed romanticism and Ibsen-esque realism.

20TH CENT. Benito Pérez Galdós (1813-1920), primarily a novelist, further advanced the realistic movement in his didactic plays (e.g., *Alcega*, 1910), which struck out at injustice and reactionary institutions. Less powerful than Galdós but far more sophisticated in dramatic technique was Jacinto Benavente y Martínez (1866-1954), Spain's greatest modern playwright. His early plays (e.g., *Gente Conocida*, 1896) quickly established him as a masterful satirist. Later he produced several highly imaginative fantasies and the impassioned melodrama *La Malquerida*, 1913, which extended his influence and reputation far beyond Spanish borders. After Benavente the most successful playwrights in modern Spain were the brothers Quintero, Serafin

(1871–1938) and Joaquín (1873–1944), whose unbroken flow of charming peasant dramas won them enduring popularity. Humor, pathos, and compassion are combined in such plays as *Papá Juan: Centenario* (performed in England and America as *A Hundred Years Old*). Also significant is Gregorio Martínez Sierra (1881–1947), who wrote *El Reino de Dios*, 1915.

In terms of international renown, Spain's leading playwright in the 20th cent. was the poet Federico García Lorca (1899–1936), whose romantic verse dramas (e.g., *La Casa de Bernarda Alba*, 1936) are widely performed. Other modern Spanish playwrights of importance are José Pemán (b. 1897), Jacinto Grau (b. 1877), and Enrique Ponce (1901–52).

LATIN AMERICA

MEXICO. The romantic movement provided a healthy stimulus for Latin American drama. In Mexico it resulted in the plays of Ignacio Rodríguez Galván (1816–42), of which *Muños, visitador de México* is the most outstanding. Other playwrights who felt the impact of romanticism were Fernando Calderón (1809–45) and José Peón y Contreras (1843–1907). Social protest emerged in the dramas of Maurice Magdaleno (b. 1906). The 20th cent. has thus far produced 2 figures of noteworthy achievement: Rodolfo Usigli (b. 1905) and Celestino Gorostiza (b. 1904). The growth of Mexican drama has been aided by the establishment of numerous *teatros debolsillo* (pocket theaters).

BRAZIL. Brazil's 1st significant dramas were written in the 2nd quarter of the 19th cent. Particularly memorable is the tragedy *Antonio José ou o Poeta e a Inquisição*, 1838, by Domingo José Gonçalves de Magalhães (1811–82). In the same year Luis Carlos Martins Pena (1815–48) produced his enduring satire *O Juiz de paz na roca*. Some of the more important romantic dramatists were Francisco Pinheira Guimarães (1832–77) and João Franklin Távora (1842–88). In the contemporary period Brazilian drama has been enriched by playwrights like

Joracy Camargo, whose *Deus lhe pague* is known throughout America, and Raoul Raoulian, author of the immensely successful *Robert the Irresistible*. Other significant names are Olwald de Andrade (b. 1890) and Claudio de Souza (b. 1876). The Brazilian government has contributed to the development of theater through various types of subsidy.

CUBA. In Cuba drama thrived in the 19th cent. but fell off sharply in the 20th. For a time, 1900–1910, *bufes cubanos*, a unique brand of political satire, were popular. In the 1930's a similarly indigenous musical form called *zarzuela cubano* found a wide following.

CHILE. Chilean theater boasts 2 figures of distinction. Acevedo Hernández (b. 1886), author of numerous folk plays and realistic dramas, and Armando Mook Bousquet (1894–1942), from whose prolific output of plays *Rigoberto*, 1935, may be singled out.

ARGENTINA. Of the Latin American countries, Argentina boasts the most flourishing theater. Although José J. Podesta (1858–1937) staged the popular *Juan Moreira* in 1886, most Argentine drama of importance began after the turn of the century. Then such plays as *La Piedra de escándalo*, 1912, by Martín Coronado (1850–1919) and *Sobre las ruinas*, 1902, by Roberto J. Payró (1867–1928) established their authors as important playwrights. The greatest modern dramatist in Argentina is the Uruguayan Florencio Sánchez (1875–1910), whose plays (*La Gringa*, 1904; *Barranca abajo*, 1905) depict the clash between old creole families and the new immigrant element. After Sánchez, the most significant figures are Samuel Eichenbaum (b. 1894), a perceptive student of psychology; Alberto Vacarezza (b. 1896), whose great tragedy *Tu cuna fue un conventillo*, 1920, became a long-run success; and Conrado Nalé Roxlo (b. 1898), author of *El pacto de Cristina*, 1945.

SCANDINAVIA

NORWAY. It is Scandinavia's distinction to have produced the 2 playwrights who mark the beginning of modern drama,

the Norwegian Henrik Ibsen (1828–1906) and the Swede August Strindberg (1849–1912). With Ibsen began the tide of realism that was to sweep across Europe. Mixing ideas, poetry, and fierce social protest, Ibsen almost singlehandedly revived European drama. His 1st great success was *A Doll's House*, 1879, championing the cause of female emancipation, which stirred the most violent debates from London to Moscow. *Ghosts*, 1881, debunking the middle-class notion of respectable marriage, and *An Enemy of the People*, 1882, exposing small-town venality, were controversial landmarks in a stormy career.

The leading Norwegian playwright after Ibsen is Bjørnstjerne Bjørnson (1832–1910), another stern social critic who called attention to many contemporary ills. The most admired of his works is *Beyond Human Power*, 1883.

In the 20th cent. there were no Norwegian dramatists of Ibsen or Bjørnson's stature, though Gunnar Heiberg (1857–1929) and Nordahl Grieg (1902–43) produced a good deal of interesting work.

SWEDEN. In Sweden, Strindberg stood almost as high as Ibsen, though he evoked less controversy and earned less notoriety. A disturbed and deeply misogynistic personality, Strindberg pioneered the techniques of naturalistic psychology in such plays as *The Father*, 1887, and *Miss Julie*, 1888, where a morbid, almost pathological tone predominates. He was also a forerunner of the expressionist drama that was to flower more fully in the 20th cent. *The Dream Play*, 1890, and *The Spook Sonata*, 1890, with their fascinating evocation of dream states, set the tone for many later developments in modern drama. A contemporary Swedish playwright of international importance is the novelist Pär Lagerkvist.

EASTERN EUROPE

While the art of theater has not flourished in Eastern Europe as it has in Western, neither has it been inactive. Hungary's Ferenc Molnár (1878–1952) created a series of engaging comedies

whose cosmopolitan tone has won them an international audience. *The Guardsman*, 1910, and *Liliom*, 1919, are his best-known works. In Czechoslovakia the Čapek brothers, Karel (1890–1938) and Josef (1887–1927), wrote several memorable plays, most notably Karel's *R.U.R.* and *Ze života hmyzu*, 1921, written in collaboration. Produced in English-speaking countries as *The World We Live In*, this latter play was enthusiastically received.

CHINA

19TH CENT. In 19th-cent. China a traditional theater, relying heavily on stylization and convention, predominated. There were 2 types of plays, *wu* (military) and *wen* (civilian). The former usually dealt with heroism and warfare, the latter with domestic life; in the latter, reverence for the family and scholarly ability were emphatic virtues. Singing generally accompanied both types of drama. Other conventions included a relatively bare, curtainless stage, where a few simple objects signified a larger setting; rhythmical, dancelike movements by the actors; lush, colorful costumes; and the use of men in female roles.

20TH CENT. Under the influence of western drama a new realistic Chinese theater grew up alongside the old. Beginning in 1907, this "talking drama," as it was called, abandoned pure Chinese for the vernacular, *pai-hua*, and gradually spread throughout China. After the "Literary Revolution" of 1919 the new drama soon gained acceptance. It tended to focus on social and economic rather than psychological problems, and revolutionary groups soon seized on it as a medium for propaganda and indoctrination. It has continued to serve this function under the Communist regime. Traditional, conventionalized drama, however, has been allowed to survive—at least until it came under attack at the time of the Great Cultural Revolution. The quality of acting in modern China owed much to the impressive example of Mei Lan-fang (1894–1943).

JAPAN

18TH AND 19TH CENTS. Two traditional forms of extremely stylized drama were pre-eminent in the 18th and 19th cents. These were the No play, an aristocratic genre, and the Kabuki, a more popular form. In the 18th cent. the most distinguished dramatists to write for the Kabuki theater were Chikamatsu Monzaemon (c. 1652-1724) and Takeda Izumo (1688-1756). In the 19th cent. the most popular guardian of Kabuki tradition was the playwright Kawatake Mokuami (1816-93).

The No play was generally an episodic treatment of a Japanese myth or legend; the Kabuki drama, involving ritualistic songs and dances, presented plays of a more worldly nature. Both made use of music (often a flute and drums), a stage open to the audience on 3 sides, chanting and declamation of lines, an all-male cast, and resplendent costumes. The stagehands often mingled with the players during the performance, and as a rule acting was emphasized rather than plot or characterization.

20TH CENT. Both the No and Kabuki theaters (especially the latter) survived as viable genres in the 20th cent. But around 1900 a new naturalistic form of drama began to emerge, one that dealt with everyday life, allowed women to appear on stage, and used the spoken rather than the literary language. It was called *shimpa* (new school). Out of it evolved modern Japanese drama, whose 1st great spokesman was Tsubouchi Shuyo in *Shingakugekiron*, 1905, a treatise on the theater. The new movement which grew up around Tsubouchi contained divergent factions, among them the neo-realistic school of Kikuchi Kan and the idealistic school of Arishima Takeo. Influenced by western playwrights and the Moscow Art Theater, Hijikata Yoshi founded the Tsukiji Little Theater in Tokyo, 1924. Subsequently another actor, Ichiawa Chojuro, organized the Progressive Theater. The groups, performed both traditional Kabuki and

modern dramas of socialist realism. Because of its left-wing origins, contemporary Japanese theater has retained a strong impulse toward social protest.

INDIA

19TH CENT. The influence of British rule in India tended to foster a realistic westernized theater from the 18th cent. onward. However, after 1850 there was a revival of classical Indian theater through translations from the original Sanskrit into Bengali. This new theater was traditional in its combination of music and dance, artificial and conventionalized subject matter, symbolic stage settings, and stress on acting. Elaborate headdresses were worn to signify particular gods or heroes. Broadly speaking, 2 genres existed: *nataka*, dealing with the exploits of mythic figures, and *prakarama*, treating aspects of everyday life. The guiding theory, known as *rasa*, called for the evocation of an emotional response from the audience, who could thereby attain serenity.

20TH CENT. Classical drama has flourished in this century due, in great measure, to the efforts on its behalf of Sir Rabindranath Tagore. Government subsidies have also helped. Tagore, who adopted the classical form in such plays as *The King of the Dark Chamber*, 1914, is India's best-known modern playwright. English influence is largely represented by the popularity of Shakespeare, who is widely performed. The most popular theater at present is the Prithvi, founded in 1943, which tours the country regularly. More modern in technique is the Theater Unit in Bombay, which performs in English, while the Gujarati Theater, also in Bombay, has shown a preference for plays of social criticism. Other dramatic groups are the Madras Theater, with a repertory of religious plays, and the Indian National Theater, which tours farms and factories. Among Indian dramatists writing in English, Bharati Sarabhai has achieved special distinction with plays like *The Well of the People*, 1943.

AFRICA

In recent years a formal African drama has begun to take shape. Various African dance troupes have toured Europe and the U.S., and the South African jazz opera, *King Kong*, created a sensation in London in 1962. In addition, numerous theatrical groups have been formed, most notably the Mbari Club in Nigeria and

the Ogunmola Folk Opera. In South Africa a National Theater was founded in 1948 with a government subsidy.

Among African dramatists the most eminent are Wole Soyinka of Nigeria, whose plays (e.g., *A Dance of the Forest*) dramatize the impact of western culture on the African mind; J. P. Clark (b. 1935), also of Nigeria, who enjoyed a notable success with *Song of a Goat*; and B. H. Khaketa of Botswana.

Newspapers, Periodicals, and Journalism

GREAT BRITAIN

EARLY NEWSPAPERS. In London at the end of the 18th cent. the *Morning Post* (founded as the *Morning Post and Daily Advertising Pamphlet*, 1772) rose to prominence. The *Times*, begun by John Walter (1739–1812) in 1785, reached a circulation of 5,000 by 1815. The editorial genius of Thomas Barnes (1785–1841) helped make the paper a national institution. In 1880 the *Evening Standard* was begun and, in 1881, the *Evening News*. The *Daily Mail*, 1896, introduced numerous typographical innovations.

In the provinces the *Manchester Guardian*, 1821, won national fame as a Whig organ and exponent of liberalism. Other important provincial journals were the *Yorkshire Post*, 1854, the *Liverpool Daily Post*, 1855, and the *Birmingham Daily Post*, 1857.

A crucial event in the history of British journalism was the abolition of the stamp tax, 1855, part of the "taxes on knowledge." With the elimination of these taxes and the consequent rise of the "penny newspaper" (the 1st in London was the *Daily Telegraph and Courier*, later the *Daily Telegraph*, founded 1855), English newspapers burgeoned. Between 1855 and 1857 over 100 new papers were established.

Notable newspapers of the past century which expired through discontinuance or merger include *Morning Chronicle*, 1769–

1862, *Daily News*, 1846–1930 (edited for a time by Charles Dickens), *Pall Mall Gazette*, 1865–1925; and *St. James's Gazette*, 1880–1903.

EARLY PERIODICALS. One of the earliest and most famous of British periodicals was the *Spectator*, published by Joseph Addison and Richard Steele. Half a century later Samuel Johnson brought out the *Rambler*, 1750–52, which won similar fame. Perhaps the greatest of British periodicals, the *Observer*, 1st appeared in 1791. During the 19th cent. 3 British periodicals achieved international renown: the *Edinburgh Review*, 1802, the *Quarterly Review*, 1809, and *Blackwood's Magazine*, 1817. The popular Sunday newspaper, *News of the World*, 1813, emphasized crime and sports.

20TH CENT. The *Daily Express*, 1900, founded by C. Arthur Pearson (1866–1921), became the 1st British paper to publish lead stories on the front page. Lord Beaverbrook (1879–1964) acquired control in 1922, and by 1966 the circulation had reached 4 m. In 1903 the *Daily Mirror* was established by Alfred Harmsworth (1865–1922), who made it the 1st halfpenny illustrated tabloid in England. The *Daily Sketch*, 1909, another illustrated tabloid, absorbed the *Daily Graphic*, 1869, in the 1920's, becoming for a time the *Daily Sketch and Graphic*. In 1911 the *Daily Herald* was established as an organ of the Labour Party. It passed into the hands of the T.U.C. (Trade

Union Congress) in 1929 and later, 1961. the *Daily Mirror* group (International Publishing Corp.) gained a controlling interest. In 1964 this group replaced the *Daily Herald* with the *Sun*. In the 20th cent. the *Times* has maintained its reputation as the most influential British newspaper. Alfred Harmsworth (owner from 1908 to 1922) introduced numerous modernizations, and George Geoffrey Dawson (editor, 1912-19 and 1928-41) provided an independent-minded editorial policy.

In the provinces the *Yorkshire Post*, *Birmingham Daily Post*, and *Liverpool Daily Post* have remained among the major organs. The *Manchester Guardian*, also one of the leading journals of opinion, became the *Guardian* in 1960 and began to appear in London as well as in Manchester.

Among the more important journals of opinion founded in the 20th cent. are the *Times Literary Supplement*, 1902, the *Listener* (a publication of the British Broadcasting Corp., founded 1929), and the cultural review *Encounter*, 1954.

FREEDOM OF THE PRESS. In the 18th cent. government harassment of the press was a frequent occurrence. John Walter, publisher of the *Times*, and the poet Leigh Hunt were among those who paid with jail sentences for having given offense to men of power. However, important victories in the struggle for the freedom of the press were: 1763, when John Wilkes (1727-97), publisher of the *North Briton*, was acquitted of "seditious libel"; 1771, when another libel case determined (though unofficially) the right of newspapers to publish parliamentary debates; 1792, when the passage of Charles Fox's libel law guaranteed a jury trial in cases of alleged defamation; and 1855, when the stamp tax was abolished.

Though not specifically protected by law, British journalists enjoy the protection of tradition. Apart from restrictions against libel (more stringent than those in the U.S.), sedition, blasphemy, etc., governmental interference in the workings of the press is practically nonexistent. As a result of this a broad spectrum of political opinion finds expression. However, charges of slackening standards and excessive concentration of ownership

prompted an investigation by a Royal Commission, 1949. As a consequence the industry began to exercise a self-regulating function through a body called the Press Council.

UNITED STATES

EARLY NEWSPAPERS. In 1783 the *Pennsylvania Evening Post*, founded by Benjamin Towne, became the 1st American daily. It was followed the next year by the *Pennsylvania Packet and Daily Advertiser*. During the same period most newspapers developed a vehemently partisan tone, acting as spokesmen for particular parties and distorting the news accordingly. Trumpeting the Federalist cause was the *Gazette of the U.S.*, 1789-1818, founded in New York by John Fenno, while Philip Freneau's *National Gazette*, 1791-93, a Philadelphia paper, briefly looked after the interests of the Jeffersonian Republicans. After 1800 some of the most influential party papers were the Washington *National Intelligencer*, 1800, organ of the Jefferson administration, and the New York *Evening Post*, 1801, controlled in its early days by Alexander Hamilton and edited from 1829 to 1878 by William Cullen Bryant.

PENNY PRESS. The advent of the "penny press" marked a new era in American journalism. Selling for a penny rather than the normal 6 c., these papers were noted for their small size, their appeal to low-income groups, their exposés of social abuses, and their use of human-interest stories. In addition, the emphasis on timeliness in the penny press resulted in the development of swifter and more efficient means of transmitting news.

The history of the penny press began with the establishment, 1833, by Benjamin H. Day of the New York *Sun*. Within a decade the *Sun* had 2 powerful competitors: the New York *Herald*, created, 1835, by James Gordon Bennett (1795-1872), and the New York *Tribune*, begun, 1841, by Horace Greeley (1811-72). Rivals for 30 years, Bennett and Greeley towered over all other editors, the former famous for innovations and organizational abil-

ity, the latter a renowned crusader and abolitionist. Elsewhere in the country, the penny (or twopenny) press was represented by the *Republican* (1844, Springfield, Mass.), the *Picayune* (1836, New Orleans), and the *Baltimore Sun*, 1837.

West of the Appalachians journalism arrived with the *Pittsburgh Gazette*, 1786. Among other important papers in the West and Midwest were the *Indiana Gazette*, 1808, the *Chicago Democrat*, 1833, the *Minnesota Pioneer*, 1849 (later the *St. Paul Pioneer*), the *Alta California*, 1849, and the *Hawaii Polynesian*, 1840-64.

During the Civil War rigid censorship was imposed on the press, and several papers were suspended, notably the *New York Daily News*, founded 1855, and the *Chicago Times*, founded 1854. In the Reconstruction era, such papers as the *Chicago Daily Tribune*, founded 1847, and the *New York Sun* emerged as powerful organs; the latter owed its greatness to the editorial genius of Charles A. Dana (1819-97). These years also saw efforts, largely successful, by many papers to free themselves from specific party ties.

BEGINNING OF MODERN JOURNALISM. Modern American journalism dates from the last quarter of the 19th cent., when Joseph Pulitzer (1847-1911) founded the *St. Louis Post-Dispatch* and, purchasing the *New York World*, transformed it into the most popular paper in the country. The *World* was lively and well written, set generally high standards of reportage, and involved itself in numerous crusades. Two of its rivals for the huge New York readership were the *New York Sun* and the *New York Herald*.

YELLOW JOURNALISM. After a youthful success with the *San Francisco Examiner*, William Randolph Hearst (1863-1951) came to New York in 1895 and bought the *Journal*. In its pages a new style of writing was born: yellow journalism. So called because of a Hearst comic strip, "The Yellow Kid," this term came to designate such journalistic techniques as a reliance on pictures, a Sunday supplement (with a special magazine and comics), stories of a lurid, sensational nature, and large headlines. A great rivalry developed between the Hearst and Pulitzer papers, with the *World* soon

perfecting its own brand of sensationalism in order to stay in the race. Elsewhere in the country the influence of yellow journalism made itself felt, and the impact of this style on American—and even world—journalism has been immense.

It was during this period, however, that a different kind of paper came to maturity in *The New York Times*. One of the world's great newspapers, the *Times* attained prominence under the editorship of Adolph S. Ochs (1858-1935), who emphasized dignity, objectivity, and conservatism, adopting the slogan "All the news that's fit to print." Maintaining extremely high standards of reportage in domestic and foreign affairs, the *Times* rose to a position of unrivaled prestige among American papers.

NEWSPAPER CHAINS. Newspaper chains became a prominent feature of American journalism at the end of the 19th cent. The 1st was the E. W. Scripps empire, which included the *Cincinnati Post*, the *Kentucky Post*, and the *Cleveland Press*. In 1922 the organization became Scripps-Howard, and soon added the *Pittsburgh Press* and the *New York Telegram*, which was later merged with the *World* and the *Sun*.

The most famous of the newspaper chains was William Randolph Hearst's, which began with the *San Francisco Examiner* and the *New York Journal*. On this foundation Hearst went on to build a journalistic empire that eventually included 40 daily papers. His personal power reached its apex in 1898, when the sensational jingoism of the papers he controlled created a favorable atmosphere for the U.S. declaration of war on Spain. Other organs he founded were the *Boston American*, 1904, and the *Chicago American*, 1900.

Second only to Scripps and Hearst was Frank Munsey (1854-1929), who in 1916 acquired the *New York Sun*, the *Evening Sun*, and the *Press*, merging the *Press* and the *Sun*. Munsey's career consisted largely of such consolidations. In 1924, for example, he combined the *Mail and Express* and the *Telegram*.

RISE OF THE TABLOID. Still another crucial chapter in the history of American journalism began at the turn of

the century when the "tabloids" were born. Beginning with the redesigned New York *World*, 1 Jan., 1900, the tabloid soon came to be characterized by extensive use of photographs, a highly compressed style, and a small 4-column page. Most successful of the New York tabloids was the *Daily News*. Founded in 1919, it captured the largest readership of any daily in America.

In recent years there have been numerous discontinuances and mergers, particularly in New York. The number of New York dailies has diminished from 6 in the 1950's to 3 in the late 1960's. The most dramatic loss was the death of the *World Journal Tribune* (a merger of the *Journal American*, the *World Telegram & Sun*, and the *Herald Tribune*), 1967.

PERIODICALS. The 1st American periodical, Andrew Bradford's *American Magazine*, appeared in Philadelphia in 1741. Outstanding magazines founded in the years 1800-1850 were the *North American Review*, 1815-1910; the transcendentalist *Dial*, 1840-41; *Youth's Companion*, 1827-29; and the *Saturday Evening Post*, 1820. *Harper's New Monthly Magazine*, 1850, became the 1st quality magazine by introducing woodcut illustrations and imported English serials. The *Atlantic Monthly*, 1857, began under James Russell Lowell's editorship. The *Nation*, still a leading political organ, was founded in 1865.

In the 20th cent. the pre-eminent periodicals empire builder was Henry Luce, founder of *Time*, 1923, and *Life*, 1936. Huge success has also been enjoyed by the *Reader's Digest*, 1922. On a more sophisticated level, such "little magazines" as the *Little Review*, 1914-29, and the *Double-Dealer*, 1921-26, specialized in avant-garde writing, and helped to give new authors their first audience. *Poetry*, 1912, began as a little magazine and grew into an established literary organ. The *New Yorker*, founded in 1925 by Harold Ross and famous for both cartoons and advertisements, also became the most influential literary magazine in the U.S. Economic problems, however, have caused a steady shrinkage in the numbers of magazines published since World War

II, and mergers and discontinuances have been frequent.

FRANCE

EARLY NEWSPAPERS AND JOURNALISM. The 1st French daily, *Journal de Paris*, was founded in 1777 and survived until 1819. It was followed by *Journal des débats* (1789; discontinued, 1939) and *Moniteur* (*Gazette nationale, ou le moniteur universel*), founded in 1789, which provided official news. In 1826, one of France's best known papers, *Le Figaro*, came into existence. The appearance 10 years later of *La Presse*, founded by Émile de Girardin (1806-81), and *Le Siècle* marked the beginning of inexpensive papers aimed at a mass market. Within a few years *La Presse* could claim a readership of 20,000 and *Le Siècle* of 38,000.

The next major development in French journalism was the passage of the *Loi Tinguay*, a law stipulating that all newspaper articles had to be accompanied by their authors' names. A lasting result of this law is the high percentage of signed articles in French papers, journalists in France are generally better known to the public than in other countries.

The French halfpenny press was born when *Le Petit journal* was founded, 1863, by Moïse Polydore Millaud. Accentuating crime and scandal, *Petit journal* appealed to a mass audience and soon had countless rivals.

In the last quarter of the 19th cent. French papers began to shift their emphasis from analysis of political situations to a relatively objective presentation of the news. Factual reporting—especially extensive coverage of foreign affairs—gave rise to a new species of newspaper known as the *journal d'information*, of which leading examples were *Écho de Paris*, 1884, and *Le Matin*, 1884.

French provincial newspapers of the 19th cent. remained stubbornly independent of Paris, and often surpassed the Parisian journals in the collection of domestic news. Among those which became nationally famous were *La Dépêche*

of Toulouse, *Le Petit Marseilles*, and *La Petite Gironde* of Bordeaux.

MODERN JOURNALISM. Modern French journalism has provided an unusually broad spectrum of political opinion. *L'Humanité*, 1904, was created by Jean Jaurès as a Socialist organ, but in 1920 became Communist and has continued to speak for the Marxist point of view. On the right *L'Action française* fought for the royalist cause after World War I, and in the political center *Le Quotidien*, 1919, struggled to preserve France's republican institutions.

At the time of the Nazi invasion Paris possessed some 25 dailies. This total was quickly reduced to 6, of which *Le Petit Parisien* and *Le Matin* (among others) continued to appear throughout the occupation with the approval of the Germans. Simultaneously, a defiant underground press was born, including such papers as *Combat* and *Libération*.

Following the liberation of France, 1944, only those papers which had resisted the Germans were allowed to continue: *L'Humanité*, *Le Populaire* (Socialist, 1920), *Le Figaro* (moderate), and *L'Aube* (Christian-Democrat). As a result many new papers sprang up. By the mid-1960's the 2 leading dailies were both of recent origin, *France-Soir* and *Le Parisien libéré*. *France-Soir* proved especially successful at adopting American-style emphasis on headlines, pictures, and accounts of crime. *Le Figaro* became famous for its coverage of literary and social activities, while *Le Monde*, another product of the postwar era, maintained very high journalistic standards and commanded a respect extending far beyond the borders of France.

PERIODICALS. The 1st French periodical was the *Journal des sçavans*, founded in 1665. The 18th cent. saw the birth of numerous imitations of the English *Spectator*, the best being *Le Pour et contre*, 1733-40, written by the Abbé Prévost. In the 19th cent. France possessed one of the world's most famous cultural reviews, *Revue des deux mondes*, 1829-1944. During the same period *L'Illustration*, 1843-1944, achieved international renown for its pictures.

In present-day France *Paris-match*, 1949, a weekly illustrated magazine, and *Marie-Claire*, 1954, a woman's magazine, are especially popular, as is a French translation of *Reader's Digest*. *Réalités*, modeled on American magazines, is noted for its lush illustrations. In the cultural sphere, the *Revue de littérature, histoire, arts et sciences des deux mondes* came into being in 1948 to replace the old *Revue des deux mondes*.

GERMANY

EARLY NEWSPAPERS AND JOURNALISM. Notable German newspapers of the 18th cent. included the *Hamburgischer Correspondent*, 1714, the *Spener'sche Zeitung*, 1719, of Berlin, and the *Hamburger Nachrichten*, 1792. Renamed the *Berlinische Nachrichten*, the *Spener'sche* survived until 1827. During the period of Napoleonic domination the German press was used as a propaganda organ by the French. Even after the liberation of Germany, however, strict supervision of the press continued.

•Among 19th-cent. German papers the *Allgemeine Zeitung*, 1798, was perhaps the most famous. Founded by Johann Friedrich Cotta (1764-1832) at Tübingen, it shifted its location during the next 50 years to Stuttgart to Augsburg to Munich. The intense revolutionary activity of the 1st half of the century found its voice in numerous short-lived organs. Also in sympathy with the insurgents were such established papers as the *Kölnische Zeitung*, 1804.

The period 1850-1900 was an era of phenomenal expansion in German journalism. Such papers as the *Frankfurter Zeitung*, 1856, became nationally famous, and by 1900 there were some 45 dailies in Berlin alone. It was also during this period that Leopold Ullstein laid the foundations of his great newspaper empire (known as the House of Ullstein) by purchasing the *Berliner Zeitung*, 1877.

20TH-CENT. NEWSPAPERS. *Der Tag*, founded in 1900, soon became a major Berlin daily, and this and other papers enjoyed extraordinary freedom

(by previous standards) from government control under the Weimar Republic, 1919-32. During this period German newspapers were divided into the *Gruppenpresse* (organs of particular political, social, and religious movements) and a *Massenpresse* (the big-city dailies with a mass circulation and a more or less objective style of reporting). It was also at this time that several publishing empires grew up. The most notable of these was the House of Ullstein, which included the *Berliner Morgenpost*, the *Vossische Zeitung*, *Tempo*, and *BZ am Mittag* (formerly *Berliner Zeitung*).

Rivaling the Ullstein chain in size and power were the papers controlled by Alfred Hugenberg, leader of the Nationalist Party. These included *Der Tag* and the *Berliner Nachtausgabe*, 1924. Another combine, founded by Rudolf Mosse, included the *Berliner Tageblatt*, the *Volkszeitung* and the *Morgenzeitung*.

The nature of German journalism changed abruptly on the accession of Adolf Hitler, 1933. Freedom of the press was suspended unconditionally, Jewish newspaper owners were eliminated, and hundreds of papers ceased publication. The *Deutsche Nachrichtenbüro* (DNB) was created to supersede all other news agencies. Hitler's personal organ, the *Volksische Beobachter*, 1920, became one of the leading papers in the country, together with such state-controlled journals as *Angriff*, 1927, and *Hitlerjugend*. As propaganda minister, Joseph Goebbels was absolute monarch of the German press.

In the postwar period, under allied occupation, a new German press was born. *Der Kurier* was founded by the French, *Telegraf* by the British, *Tagespiegel* by the Americans, and *Tagliche Rundschau* by the Russians. After the establishment of the Federal Republic, many new papers were created, old ones reappeared, and occupation papers became permanent. In the late 1960's the largest readership in West Berlin had been attained by *Morgenpost* and *BZ am Mittag*, 2 revived pre-Hitler papers. Of lower circulation but higher quality are

Der Tagesspiegel and *Telegraf*, 2 surviving occupation papers. In East Berlin 8 daily papers flourish.

PERIODICALS. The earliest German periodical was *Acta eruditum*, 1682-1731. In the 18th cent. *Der Vernunftler*, 1713, and *Die lustige Fama*, 1718, achieved fame by adopting the style of Addison and Steele's *Spectator*. Later in the century C. M. Wieland's *Der Teutsche Merkur*, 1773-1810, was a leading literary periodical, while the *Jenaische Allgemeine Litterature-Zeitung*, 1804-41, became famous under Goethe's editorship. Political ferment bubbled up in the pages of the *Jahrbucher für wissenschaftliche Kritik*, 1827-46. In the 2nd half of the 19th cent. the *Deutsche Rundschau*, 1874, became an influential journal.

In the 20th cent. the status of the periodical press in Germany has varied with the political situation. In the post-World War II era, however, a certain stability was achieved, and by 1960 there were over 4,000 German periodicals, among them the *Deutschland Review*, 1949, *Spiegel*, 1947, *Die Besinnung*, 1946, and the picture magazine, *Zeit und Bild*, 1947.

SOVIET UNION

PREREVOLUTIONARY NEWS-PAPERS. Although newspapers existed in Russia as early as 1703, the brutal repression enforced by successive czars stunted the growth of Russian journalism until the 19th cent. By then such papers as *Novaya Vremya* had become famous. Meanwhile, revolutionaries seized on the press as a means of disseminating their ideas, and the results included *Kolokol* (*Bell*), founded in London, 1857, by refugees, and *Novaya Zhizn* (*New Life*), established, 1905, by Lenin.

SOVIET JOURNALISM. After 1917 the Russian press became an arm of the government. By 1966 there were some 6,000 daily newspapers in the Soviet Union, some national, some issued by individual republics, and some municipal. These papers appeared in a total of 60

different languages, the chief ones being Russian, Byelorussian, Uzbek, and Ukrainian.

The foremost paper in the Soviet Union is *Pravda* (Truth), official organ of the Communist Party (1966 circ., 7 m.). Regional editions appear throughout the USSR. *Pravda* generally consists of from 4 to 8 pages, is conservatively designed, avoids sensationalism, and emphasizes politics, science, and education. Second only to *Pravda* in influence is *Izvestia* (Spark), the chief publication of the Presidium of the Supreme Soviet (1966 circ., 8.3 m.). Publications aimed at specific groups within the Soviet Union include *Trud* (trade unions) and *Selskaya Zhizn* (agriculture). The official Soviet news agency is *Telegrafnuye Agentstvo Sovetskovo Soyuzu* (TASS), which provides both domestic and foreign news.

PERIODICALS. The 1st Russian journal was *Yezhmesyachnaya Sochineniya* (Monthly Works), founded in 1755. Among the most popular of Soviet magazines today are *Krokodil*, a humorous publication often used to satirize the West, and *Novy Mir* (New World), a cultural journal.

OTHER EUROPEAN COUNTRIES

ITALY. Italy's largest paper is *Corriere della sera*, published in Milan. Other important dailies are *Unità* (Communist), Rome; *La Nuova Stampa*, Turin; and *Il Tempo*, Rome. In 1962 there were 95 Italian dailies. A unique aspect of the Italian press is the so-called *terza pagina*, or "3rd page," where cultural news is discussed.

SPAIN. By 1962 Spain was supporting over 100 dailies. At present the largest is *A.B.C.* Of the numerous papers in Madrid, *Ya* (Catholic) and *Arriba* (Falangist) are among the most popular. All Spanish papers are subject to strict government censorship.

PORTUGAL. Severe government repression has hampered the growth of a press in Portugal. The highest circulation in the country has been achieved by 2 dailies, *Diario de noticias* and *Diario*

Popular. By 1962 there were 25 dailies in Portugal.

BELGIUM. The biggest of the Belgian newspapers are issued in Brussels, *Le Soir* and *Het Laatste Nieuws*. In Antwerp the major organ is *Gazet van Antwerpen*. In 1962 there were 47 dailies, 18 of them Flemish, 28 French, and 1 German. In Belgium freedom of the press is constitutionally guaranteed.

NETHERLANDS. The largest Dutch paper is *Het Vrije Volk*, a Socialist paper published in Amsterdam, Groningen, Rotterdam, and Arnhem. *Het Parool* and *De Telegraaf* (both independent) are the next largest. The oldest Dutch newspaper is *Oprechte Haarlemsche Courant*, founded in 1656. There were 93 newspapers in the Netherlands in 1964.

DENMARK. Copenhagen's *B.T.* has the largest readership in Denmark, while the *Berlingske Tidende* is the oldest paper in the country and the most respected. Next in popularity is the *Politiken*, a Liberal organ. In 1962 there were some 81 dailies in Denmark.

SWEDEN. The 3 most popular dailies in Sweden are *Dagens Nyheter*, *Expressen*, and *Aftonbladet*, all originating in Stockholm. The oldest paper is *Norrköpings Tidningar*, founded in 1758. In 1962 there were more than 94 dailies in the country.

SWITZERLAND. The multiple languages of Switzerland appear to have encouraged the growth of newspapers. In 1962 there were no less than 127: 67.5% German, 26% French, and 4.5% Italian. *Tages-Anzeiger* is the largest Swiss paper.

AUSTRIA. One of the major Austrian papers today is the influential *Die Presse* (independent). Like most present-day Austrian papers, it was founded after World War II. Earlier papers included the *Wiener Zeitung*, the official government newspaper, and the *Arbeiter Zeitung* (Socialist). Two organs represent the majority People's Party, *Österreichische Neue Tageszeitung* and *Das Kleine Volksblatt*, a tabloid.

GREECE. The poverty of modern Greece has prevented the development of a flourishing newspaper industry, though by 1964 there were no less than 95 dailies

in the country. Athens is the center of activity, supporting over 20 dailies; of these *Akropolis* has the largest readership. Among the most distinguished papers are the Athenian *Kathimerini* and the Salonikan *Makedonia*.

FINLAND. The major paper is *Hel-singin Sanomat* and the oldest is *Abo Underrättelse*; 1824. In 1962 Finland had 91 dailies, 11% printed in Swedish.

EASTERN EUROPE. The press in the Communist states of Eastern Europe is, in general, in the service of party and government. In Czechoslovakia the official Communist organ, *Rudí Pravo*, has the largest circulation. Other important dailies are *Mladá Fronta* (Youth League) and *Prace* (Labor). In Hungary journalistic activity is centered around *Nepszabadság*, the party newspaper. In Rumania the trade unions are represented by *Munca*, the government by *România Liberă*, and the party by *Scinteia*. In Bulgaria the major newspapers are *Zemledelsko Znam* (Peasant Union), *Otechestven Front* (Fatherland Front), and *Rabotnichesko Delo* (Communist Party). In Yugoslavia newspapers are printed in 2 alphabets, Cyrillic for Serbia, Montenegro, and Macedonia, and Latin for Croatia and Slovenia. The party newspaper is *Borba*. Other leading organs are *Vjesnik* (Zagreb), *Oslobodjenje* (Sarajevo), and *Politika* (Belgrade). Of the Communist countries, Poland possesses the most independent press, and a relatively objective form of reporting prevails. The official party organ is *Trybuna Ludu*, while the highest circulation is possessed by *Express Wieczorny*.

LATIN AMERICA

EARLY NEWSPAPERS. The 1st regular newspaper in Latin America, *Gaceta de México*, appeared in 1722. *Diario de México* and *Diario de Veracruz*, both founded in 1805, were the 1st daily papers. Among the oldest journals still publishing in South America are *La Capital*, 1867, in Argentina, and *Diario de Pernambuco*, 1825, in Brazil. A major hindrance to the growth of journalism in

the 19th cent. was censorship, exercised 1st by the Spanish and Portuguese authorities and later by the governments of the newly independent republics.

20TH CENT. In 1962 there were about 900 daily newspapers publishing in Latin America. The states which contributed most heavily to this total were Brazil (200 dailies), Mexico (140), Argentina (150), and Peru (60). The actual readership, however, of these numerous papers was rather low because of widespread illiteracy. At present a few papers, like *La Razón* and *Clarín* of Buenos Aires, reach a fairly large audience, but the majority of dailies do not sell more than 50,000 copies. The most famous journal in South America is undoubtedly *La Prensa* of Buenos Aires.

PERIODICALS. Among the major periodicals in Latin America in 1964 were Mexico's *Tiempo*, a news magazine modeled on *Time*; Argentina's *Veritas*, which stresses business reports; and Brazil's *O Cruzeiro*, a picture magazine with the largest circulation in the area. Latin American editions of *Life* and *Reader's Digest* are also popular.

ASIA

CHINA. Modern Chinese newspapers began in the 19th cent. The 1st paper intended for the general public was the English-language *Canton Register*, 1827. Other English-language papers followed, among them the *China Mail* of Hong Kong, 1845, with Andrew Shortrede as editor. Chinese-language papers began to appear in 1858 with a translation of the *China Mail* called *Chung Ngai San Pao*. Soon afterward many Chinese-language papers were founded, the most important of these being *Shun Pao* of Shanghai.

The liberal constitution promulgated after the revolution of 1911 encouraged the growth of newspapers. By 1921 over 500 dailies were in existence. *Sin Wan Pao* of Hong Kong reached a circulation figure of c. 350,000, with *Shun Pao* not far behind. After the Communist takeover, 1949, all newspapers in China were subordinated to the party. By the late 1950's

nearly 800 dailies were being issued throughout the country, the most important being *Jen Min Jih Pao* (*People's Daily*). The official news agency is Hsin Hua. Nationalist China supports 30-odd dailies, including 3 in English. The largest paper in Taiwan is *Chung Yang Jih Pao*.

JAPAN. The 1st Japanese newspaper was the *Shipping List and Advertiser*, 1861, of Nagasaki, an English-language journal. The 1st Japanese-language paper was *Shimbunshi*, 1864. After the Meiji Restoration, 1868, Japanese journalism began to burgeon, and newspapers sprang up in Tokyo, Yokohama, and Kyoto. The Tokyo *Nichi-Nichi*, 1872, and the Osaka *Mainichi*, 1876, were 2 of the most successful of the new papers. Meanwhile the coverage of foreign affairs was improved by the sophisticated Tokyo *Asahi* 1888, and Osaka *Asahi*, 1879.

After World War II Japanese newspapers were strictly supervised by the allied authorities. Gradually control was lessened, and by 1962 Japan could claim 100 dailies with a combined readership of 39 m. In Tokyo 3 papers dominate: *Yomiuri*, *Asahi*, and *Mainichi*. Also publishing in Tokyo is the *Nippon Keizai Shimbun* (the "Japanese Wall Street Journal"). In Osaka, *Asahi* and *Mainichi* are the largest papers.

INDIA. The 1st Indian newspaper, the *Bengal Gazette or Calcutta General Advertiser*, was launched in 1780 by James Augustus Hickey. It was followed the same year by the *Indian Gazette or Calcutta Advertiser*, which dealt mainly with East India Co. affairs. Vernacular papers began with the *Digdarshan*, 1818, published in Bengal. A prime mover in the journalism of this period was the religious leader Ram Mohan Roy, who started *Mirat-ul-Akhbar*, a Persian-language weekly, in Calcutta. Later he lent his support to *Banga Dutt* (*Bengal Herald*), whose multilingual editions included Persian, Hindi, and Bengali.

In 1962 India possessed 300 dailies—76 in Hindi, 42 in Urdu, 33 in English, and the remainder in other languages. Among English-language papers, the leading organs are the *Times of India* of Bombay,

founded in 1838; the *Amrita Bazar Patrika*, 1860, a Calcutta paper; and the *Tribune*, 1881, of the East Punjab. The largest non-English dailies are the Bengali *Ananda Bazar Patrika* of Calcutta and the Hindi *Naubharat Times* of New Delhi. Other prominent non-English dailies are the Tamil *Thanthi* and the Telugu *Andhra Patrika*, both of Madras.

OTHER ASIAN COUNTRIES. In Pakistan perhaps the most influential daily is *Dawn*, which appears in many languages. The *Pakistan Times* of Lahore is the leading English-language paper. In the Philippines the 1st regular newspaper was *Del Superior gobierno*, 1811, and the 1st daily, *La Esperanza*, 1846. At the present time the largest daily is the *Manila Times*, founded in 1848. In Indonesia the earliest paper was the *Bataviaase Nouvelles*, a weekly founded in 1744. The leading journal today is *Indonesia Raya*. Burma's oldest paper is the *Ianthawaddy*, 1889. In Singapore, the *Straits Times*, founded in 1845, is still one of the leading papers, while in Malaysia the *Malay Mail*, 1896, retains its importance. In Ceylon the Sinhalese and Tamil tongues are represented by the *Dinamina* and *Thinakaran* respectively.

MIDDLE EAST AND AFRICA

TURKEY. The Turkish press has, in general, suffered from official restriction and governmental interference. The largest paper in the country is *Hürriyet* of Istanbul, a Turkish-language journal, but newspapers also appear in Greek, Armenian, English, and French. In Istanbul alone over 40 individual dailies are published, and in Turkey as a whole over 300 were in existence in 1962.

EGYPT. Although newspapers were printed for a short time on Napoleon's orders in 1798, the 1st permanent Egyptian paper was an official gazette printed in 1828 by Mohammed Ali. A true Egyptian press emerged in the 2nd half of the 19th cent., and by 1865 there were 12 papers in Cairo and 2 in Alexandria. The oldest and most influential Egyptian journal is *Al Ahram*, 1875, which pioneered

the use of foreign correspondents and introduced linotypes with Arabic characters at the turn of the 20th cent.

OTHER MIDDLE EASTERN COUNTRIES. In Iran the 1st regular newspaper was *Rūznāma*, 1851, of Teheran, and the 1st daily, *Khulāsātul-Hawādith*, 1898. At present *Ettela'at*, 1925, is the leader. In Lebanon, though journalistic activity was slight until recently, the country now supports more than 30 dailies, most of them in Beirut. In Syria, the press is of similarly recent origin, yet by 1962 there were c. 20 Arabic-language dailies in publication. In Iraq daily newspapers have existed since 1914, when the *Baghdad Times* (later the *Iraq Times*) was founded. In Jordan there are 6 dailies, and in Saudi Arabia, 2: *Al Bilad* and *Um Al Quarah*. In Palestine, the 1st Hebrew-language daily was *HaHeruth*, 1909. After the state of Israel was established, journalism flourished, and by 1962 there were 23 dailies being published in, among others, the Hebrew, Yiddish, German, and Bulgarian languages. The largest Israeli paper is *Ma'ariv*, 1948.

SOUTH AFRICA. Journalism in South Africa dates from the publication in 1800

of the *Capetown Gazette* and *African Advertiser*. In the mid-20th cent. the most influential English-language papers are the *Cape Times*, 1876, the *Cape Argus*, 1857; and, in the Transvaal, the *Star*, *Rand Daily Mail*, and *Sunday Times*. Afrikaans-language papers include *Die Burger* of the Cape, *Die Vaderland* of Johannesburg, and *Die Volksblad* of Bloemfontein. The 1st African-language newspaper was the Xhosa *Imvo Zabantsundu*, 1884. More than 20 African-language papers exist today.

FRENCH-SPEAKING AFRICA. In Tunisia there are 5 dailies at present, 2 in Arabic and 3 in French; the largest is *L'Action*. In Algeria 7 dailies are published in French and Arabic; *L'Écho d'Alger* is the best known. In Morocco there are 11 dailies, in Spanish, French, and Arabic.

ENGLISH-SPEAKING AFRICA. In the mid-20th cent. 7 Arabic- and 2 English-language dailies were appearing in the Sudan; in Ghana, 5, all in English; in Nigeria, 22; in Kenya, 4; in Sierra Leone, 2; in Liberia, 1; and in Tanzania, 6.

In all of Africa, c. 1962, there were some 230 dailies in publication.

Cinema, Radio, and Television

CINEMA

SILENT FILMS. The foundations of the art of the motion picture were laid in several different countries. The American cinema was responsible for the following landmarks in silent film history: the "peepshow" kinoscope, developed by Thomas Edison in 1889; the 1st narrative film, *The Great Train Robbery*, 1903; the creation and growth of the Nickelodeon; and the spectacularly successful *The Birth of a Nation*, 1915, and *Intolerance*, 1916, made by the father of American—and perhaps of world—cinema, D. W. Griffith (1875–1948). Griffith's dynamic, brilliantly edited films revolutionized cinematic technique and made "the movies" an art. His genius was equaled by

that of Charles Chaplin (b. 1889), whose combination of pathos and comedy in films which he wrote, directed, and starred in (e.g., *City Lights*, 1930) made him world famous.

Particularly vital also was the German school, where surrealism and the technique of the moving camera were combined to produce such masterpieces as *The Cabinet of Dr. Caligari*, 1919, for which the scriptwriter, Carl Mayer, was largely responsible. In Russia, a radically different theory dominated the cinema. Known as "montage," it called for a series of brief shots assembled, for rhythmic effect, into an over-all pattern. Its masters were Sergei Eisenstein (1898–1948) and V. I. Pudovkin (1893–1953); the former's *Battleship Potemkin*, 1925, has taken its

place among the masterworks of world cinema. In Scandinavia, the greatest film maker of the silent era was the Dane, Carl Dreyer, who cultivated the close-up in his memorable *The Passion of Saint Joan of Arc*, 1929.

THE MODERN CINEMA. In the U.S., chiefly in Hollywood, Calif., the major technical innovations of the modern cinema were born: the 1st motion picture using a sound track beside the picture frames (*The Jazz Singer*, 1927), the invention of color movies (Technicolor, 1930's), and the development of wide-screen techniques (Cinerama, Cinemascope, 1950's). Generally speaking, American film makers have proved themselves masters of escapism, specializing in such genres as the melodrama, the "Western," and the musical, in which directors like John Huston, Preston Sturges, Vincente Minelli, and Fred Zimmerman have been prominent.

In Europe a new breed of directors appeared with the coming of sound, and succeeded in adapting spoken dialogue to the visual nature of the medium. Especially gifted in this respect was the Frenchman, René Clair, whose talents were best exemplified in *A Nous la liberté*, 1931. Clair's countryman, Jean Renoir, also made his mark in the early sound era. In 1944 Marcel Carné equaled the best work of both these men with his richly textured *Les Enfants du paradis*. Germany too remained in the vanguard as directors like Fritz Lang and G. B. Pabst came to the fore.

Following World War II international reputations were earned by Robert Bresson in France, Vittorio de Sica in Italy, Carol Reed in Britain, and the Spanish-born Luis Buñuel in Mexico. The 1950's gave birth to the "New Wave" in France, a school of young directors in which François Truffaut and Jean-Luc Godard were the principal figures. In Italy Michelangelo Antonioni came into prominence. The most impressive films of the decade, however, were those of the Italian Federico Fellini and the Swede Ingmar Bergman. The former's *La Strada*, 1954, and the latter's *The Seventh Seal*, 1956, were major landmarks in world cinema.

In Japan the most admired director was Akira Kurosawa (*Rashomon*, 1951). In the 1960's films from Eastern Europe, particularly from Poland and Czechoslovakia, attracted much attention.

RADIO AND TELEVISION

EUROPE. In Great Britain, radio broadcasting began in 1920 under an independent monopoly granted by the government to the British Broadcasting Co. (later Corp.), or BBC. Television, also controlled by the BBC, began in 1939, but lapsed during World War II. In 1954 commercial television was permitted under the supervision of an Independent Television Authority and operating alongside the BBC's revived service. In general, European radio and TV are organized along similar lines to the British: exclusive broadcasting privileges leased to a private co. or cos. and the individual set owner paying a regular annual license fee. European commercial radio broadcasting began in the 1920's and television in the 1950's. A smaller percentage of time has traditionally been devoted to advertising than in the U.S. In Eastern Europe, where commercial advertising is not employed, all communica-

UNITED STATES. Commercial radio in the U.S. began in the 1920's. By 1963 both standard (AM) and frequency modulation (FM) stations existed in abundance. Commercial TV appeared as a significant force only after World War II, but by the 1960's had become the

foremost communications medium in the country, devoting the bulk of its program time to situation comedies, dramatic shows, Westerns, and other types of popular entertainment. All radio and TV stations and networks, though generally privately owned, are regulated by the Federal Communications Commission (FCC).

Music

EUROPE AND THE UNITED STATES

18th and 19th Cents.

1750-1827

CLASSIC PERIOD. Contributing to the evolution of new forms in music was the social and cultural unrest generated by the rationalist philosophy of the Enlightenment. Previously, the monumental forms of the baroque period, 1600-1750, had found their highest expression in the masterworks of Johann Sebastian Bach (1685-1750), whose major works include the B minor Mass, 1738; *Passion According to St. John*, 1723; *Passion According to St. Matthew*, 1740; and of Georg Friedrich Handel (1685-1759)—*Messiah*, Dublin, 1742. These baroque composers were succeeded by a new generation of composers presaging the changing taste and ideas of the 2nd half of the 18th cent. Instrumental music, long subordinated to the dominance of vocal music, now emerged as the primary medium of expression. The classic sonata of 3 movements, later 4, developed from earlier models, crystallized in the genius of Franz Joseph Haydn (1732-1809)—104 symphonies for orchestra (No. 94, "Surprise," 1791; No. 100, "Military," 1794; No. 101, "Clock," 1794; No. 104, "London," 1794), 26 concerti, 84 string quartets. The emergent architectonic form served the composers of the classic period. Also by Haydn are 2 outstanding oratorios—*The Creation*, 1798, and *The Seasons*, 1801—which resemble their baroque choral and instrumental counterparts.

MOZART. The aesthetic and artistic ideals of the period are superbly exemplified in the compositions of Wolfgang Amadeus Mozart (1756-91). His works include 12 operas (*Marriage of Figaro*, K.492, 1786; *Don Giovanni*, K.527, 1787; *Magic Flute*, K.620, 1791, in German), 41 symphonies (No. 39 in E flat, K.543; No. 40 in G minor, K.550; No. 41 in C major, K.551), 35 concerti, much chamber music, sonatas for piano, and masses (*Requiem*, 1791). Originality, musical sophistication, charm, wit, and sentiment are expressed with elegance and refinement in compositions that balance and integrate form and content, music addressed to the aristocratic audience upon whom the composer depended for patronage. By 20th-century standards the orchestras were small, generally including strings, flute, oboe, clarinet (late Mozart), bassoon, trumpets, and horns. Trombones were introduced by Gluck and Mozart in their operas (and were 1st used in symphonic music by Beethoven in his 5th Symphony); also tympani.

BEETHOVEN. The classic period attained its climax in the works of Ludwig van Beethoven (1770-1827), whose works include 9 symphonies (No. 3 in E flat major, Op.55, "Eroica"; No. 5 in C minor, Op.67; No. 7 in A major, Op.92; No. 9 in D minor, Op.125, 1824, with chorus and soloists); 5 concerti for piano (No. 4 in G major, Op.58, and No. 5 in E flat, Op.73, "Emperor"); violin concerto in D major, Op.61, 1806; 32 sonatas for piano alone; 10 sonatas for violin and piano; numerous chamber music works; masses

(*Missa Solemnis* in D major, Op.123, and Mass in C); and the opera *Fidelio*, 1805, rev. 1806. Beethoven infused the established forms with a dynamism of emotional energy and spiritual elevation that transcended the personal expression of his genius. In depth and range of expression he mirrored the spirit of the changing social, cultural, economic, and political climate of Western Europe which followed the French Revolution, and forecast the approaching romanticism of the 19th cent. The liberating influence of these changes affected the author's humanistic and individualistic approach to his art and broadened his attitude toward his audience, the new *bougeoisie* that was emerging in the early stages of the Industrial Revolution.

1824-98

ROMANTICISM. The introduction of poetry into the classic symphonic form in Beethoven's 9th Symphony in 1824 marks a new era in the evolution of music. The verses of Schiller's *Ode to Joy* proclaiming the brotherhood of man, sung by a quartet of singers and a chorus, epitomized Beethoven's optimism about man's ultimate ability to resolve his problems.

Franz Peter Schubert (1797-1828) largely followed Beethoven's principles of form, yet imbued his 8 symphonies with his own exquisite sense of tender poetry, sensitive orchestral coloring, and characteristic harmonies and modulation, thereby bridging the period from classic to romantic. His symphonies include No. 7 in C major, "The Great," 1828, and No. 8 in B minor, "The Unfinished," 1822. Subsequent composers, though still influenced by the classic concept of form, tempered their symphonies with elements drawn from romanticism—broader melodic line; more complicated harmony, in some cases even chromatic; more involved and even cross-currented rhythms; and more elaborate and even more sensitive orchestration. Notable among these composers were Felix Mendelssohn (1809-47)—Symphony No. 3 in A minor, "Scotch," 1842; No. 4 in A major, "Italian," 1833; No. 5 in D minor, "Reformation," 1830-

32, Robert Schumann (1810-56)—Symphony No. 1 in B flat major, "Spring," 1841; No. 3 in E flat major, "Rhenish," 1850; No. 4 in D minor, 1841; Johannes Brahms (1833-97)—Symphony No. 1 in C minor, Op.68, 1876; No. 2 in D major, Op.73, 1877; No. 3 in F major, Op.90, 1883; No. 4 in E minor, Op.98, 1885; Anton Bruckner (1824-97)—Symphony No. 4, "Romantic," 1874; No. 7, 1881-83; No. 9, 1894. César Franck (1822-90)—Symphony in D minor, 1888; Peter Ilyich Tchaikovsky (1810-93)—Symphony No. 4 in F minor, 1877; No. 5 in E minor, 1888; No. 6 in B minor, "Pathétique," 1893; Antonin Dvořák (1841-1904)—Symphony No. 5 (now known as No. 9) in E minor, Op.95, "From the New World," 1893.

PROGRAM MUSIC. The *Symphonie fantastique*, 1830, of Hector Berlioz (1803-69), with its autobiographical program and extravagant instrumentation, served as a model for much of the romantic program music to follow. Such music found its subject matter in extra-musical sources, such as poetry, painting, folklore, and philosophy, and was given form in the 1-movement symphonic tone poems of Franz Liszt (1811-86)—*Tasso*, 1840-48; *Les Préludes*, 1845. Liszt's *Faust Symphony* (after Goethe), 1850, comprises 3 movements, musical characterizations respectively of Faust, Gretchen, and Mephistopheles. Subsequently, Richard Strauss (1864-1919) intensified the form in a series of tone poems—*Aus Italien*, 1886; *Macbeth*, 1887; *Don Juan*, 1888; *Tod und Verklärung*, 1880; *Till Eulenspiegel*, 1895; *Also sprach Zarathustra*, 1896; *Don Quixote*, 1897; *Ein Heldenleben (Hero's Life)*, 1898. Other examples of pictorial orchestral music were provided by Mendelssohn's *Midsummer Night's Dream*, 1826; *Fingal's Cave*, 1832; *Ruy Blas*, 1839; and by symphonic suites such as *Scheherazade*, 1888, by Nicolai Rimsky-Korsakov (1844-1908).

SMALLER FORMS. The romantic aesthetic, with its stress on personal emotion, found its proper medium in the *lieder* (art songs) of such outstanding composers as Franz Schubert—*Der Erlkönig*, D.328, 1815; *Gretchen am Spinnrade*, 1814; *Serenade*, D.889, 1826; as well as in song

cycles, including *Die Schöne Müllerin*, D.795, 1823; *Die Winterreise*, D.911, 1827; *Schwanengesang*, D.957, 1828; Robert Schumann—*Die beiden Grenadier*, 1840, and the song cycles *Frauenliebe und -leben*, Op.42, 1840, and *Dichterliebe*, Op.48, 1840; Johannes Brahms—*Vergleichliche Ständchen*, Op.84, 1878–81; *Sapphische Ode*, Op.94, 1884; *Wiegenlied*, Op.49, c. 1868; and the song cycles *Magnolia*, Op.33, 1861–68 and *Vier Ernste Gesänge*, Op.121, 1896; Hugo Wolf (1860–1903)—*Nachgelassenelieder* (Youthful Songs); *Mörkelieder*, 1888; *Eichendorfflieder*, 1888; *Goethelieder*, 1889; *Spanisches Liederbuch*, 1890; *Italienisches Liederbuch*, 1891–96; Richard Strauss—4 sets of songs with orchestra, 1897–1921; 26 sets with piano, 1882–1929.

MUSIC FOR PIANO. The piano, invented by Bartolommeo Cristofori in Florence, c. 1710, improved by Broadwood (London, 1817) and Érard (Paris, 1821), with its fuller tonal resources, provided the 19th-cent. composer with an instrument of extraordinary range and possibilities for expression. It inspired a variety of new forms (mostly short), such as études, preludes, waltzes, mazurkas, polonaises, nocturnes, intermezzi, capriccios, rhapsodies, fantasies, etc. Foremost among the composers for the piano were Frédéric Chopin (1810–49)—*Fantasia* in F minor; ballads, waltzes, preludes, mazurkas, nocturnes, and, in larger forms, sonatas in B flat minor, 1839, and in B minor, 1844; Franz Schubert—6 *Moments musicaux*, 1823–28; 8 impromptus, 1827; *Wanderer Fantasia*, 1822; and 11 sonatas (A flat major, 1817; B flat major, 1828); Robert Schumann—*Album for the Young*, Op.68, 1848; *Scenes from Childhood*, Op.15, 1838; *Papillons*, Op.2, 1832; *Car-naval*, Op.9, 1834–35; *Symphonic Études*; *Fantasy* in C major, Op.17, 1836; and 3 sonatas; Felix Mendelssohn—*Songs in Short Words*, 8 vols., 1830–45; *Variations sérieuses*, Op.54, 1841; Franz Liszt—*Années de Pèlerinage*, 3 vols., 1855, 1858, 1883; 12 *Études d'exécution transcendante*, 1852; *Deux études de concert: Waldesrauschen* and *Gnomenreigen*, 1849–63; *Deux légendes*, 1866; 20 *Hungarian Rhapsodies*, 1851–86; Johannes

Brahms—6 sets of variations; 3 rhapsodies (B minor, A minor, E flat major); intermezzi, capriccios, ballades; 3 sonatas.

MUSIC FOR SOLO INSTRUMENTS WITH ORCHESTRA. The piano with orchestra served as a vehicle for distinguished concerti (large form): Schumann—A minor, Op.54, 1845; Chopin—E minor, Op.11, 1833; F minor, Op.21, 1836; Liszt—E flat major, Op.22, 1857; A major, Op.23, 1863; Brahms—No. 1 in D minor, Op.15, 1858; No. 2 in B flat major, Op.83, 1881; Tchaikovsky—No. 1 in B flat minor, Op.23, 1875; Grieg—A minor, 1868, rev. 1907. Concertos for violin and orchestra include Mendelssohn—E minor, Op.64, 1844; Brahms—D major, Op.77, 1878; Paganini—No. 1 in E flat major, No. 2 in B minor; Tchaikovsky—D major, Op.35, 1878. Brahms also composed a double concerto for violin and cello in A minor, Op.102, 1887.

CHAMBER MUSIC. Piano quintets include Schubert—Quintet in A, "Die Forelle," 1819; Schumann—E flat major, Op.47, 1842; Brahms—F minor, Op.34, 1864; César Franck—F minor, 1879. Other distinguished chamber works (large form) include Schubert—string quartets in A minor, D.804, 1824; D minor, D.810, "Death and the Maiden," 1824–26; A major, D.887, 1826; string quartet in C, D.956, 1826; trio in B flat major, D.898, 1827; octet in E for clarinet, horn, bassoon, and string quartet, D.803, 1824; Mendelssohn—octet in E flat for strings, Op.20, 1825; piano trio in D minor, Op.49, 1837; Brahms—string quartets in C minor, Op.51, No. 1, 1873; A minor, Op.51, No. 2, 1873; B flat major, Op. 67, 1875; sextets in B flat major, Op.18, 1860, and in G major, Op.36, 1865; clarinet quintet (with strings) in B minor, Op.115, 1891.

CHORAL WORKS. Religious works for chorus and orchestra include Schubert—Mass in A flat, D.667, 1819–22; Mass in E flat, D.957, 1828; Mendelssohn—oratorios (influenced by Handel and Haydn), *St. Paul*, Op.36, 1838, and *Elijah*, Op.70, 1876; Berlioz—*L'Enfance du Christ*, 1854; Requiem (*Grande Messe des Morts*), Op.5, 1837; *Te Deum*, 1849; Liszt—*Hungarian Coronation Mass*, 1867;

oratorios, *Legend of St. Elizabeth*, 1857-62, and *Christus*, 1855-62; Brahms—*Ein Deutsches Requiem* (Protestant), 1866, Verdi—*Manzoni Requiem*, 1874. Secular works include Brahms—*Rhapsodie (Alto Rhapsody)*, Op. 53, 1869, *Song of Destiny*, Op. 54, 1871; *Nanie*, Op. 82, 1880-81; *Song of the Fates*, Op. 89, 1882.

1762-1814

OPERA: CLASSIC PERIOD. Italian opera maintained its pre-eminence in the repertory of European opera houses throughout the 18th cent. The "reform" operas of Christoph Willibald Gluck (1714-87)—*Orfeo ed Euridice* (Vienna, 1762) and *Alceste* (Vienna, 1767)—represent an effort to avoid the abuses and excesses of Italian opera and to confine music to its proper function of serving poetry to express the plot. The official opera of the Austrian court remained Italian, the humbler *Singspiel*, with its folk subject matter in the vernacular, being relegated to less prestigious theaters. The trio of Italian operas by Mozart to librettos by Lorenzo da Ponte (1749-1838)—*L'Nozze de Figaro* (*Marriage of Figaro*, Vienna, 1786), *Don Giovanni* (*Don Juan*, Prague, 1787), and *Così fan Tutti* (*Thus Do They All*, Vienna, 1790)—and his German opera, *Die Zauberflöte* (*The Magic Flute*, Vienna, 1791), with libretto by Emanuel Schikaneder, have survived as musical masterpieces. Beethoven's only opera, *Fidelio*, originally performed in Vienna in 1805 with a French libretto and revised twice to a final German version performed in Vienna in 1814, has its roots in Mozart, but exemplifies Beethoven's unique dynamism.

1821-42

OPERA: ROMANTIC PERIOD. Founder of the German romantic opera was Carl Maria von Weber (1786-1826), whose *Der Freischütz* (*The Freeshooter*, Berlin, 1821) incorporated such characteristics as (1) romanticizing plots, using folklore and legend; (2) elements of the supernatural; (3) nature, wild and mys-

terious; (4) use of German folksongs to characterize the realities of contemporary life; (5) recurrent musical motives; and (6) brilliantly effective pictorial orchestration, defining a style Germans recognized as their own, and inspiring a developing tradition. Also by Weber were *Euryanthe* (Vienna, 1823), based on medieval romanticism, and the fairy opera *Oberon* (English libretto, London, 1826).

1842-82

WAGNERIAN OPERA. German opera reached its zenith with the controversial operas and music dramas of Richard Wagner (1813-83)—*Rienzi* (Dresden, 1842); *Der Fliegende Holländer* (*Flying Dutchman*, Dresden, 1843); *Tannhäuser* (Dresden, 1845), *Lohengrin* (Weimar, 1850); *Der Ring des Nibelungen: Das Rheingold* (1854, performed Munich, 1869), *Die Walküre* (1856, performed Munich, 1870), *Siegfried* (1871, performed Bayreuth, 1876), and *Die Götterdämmerung* (*Twilight of the Gods*, 1874, performed Bayreuth 1876); *Tristan und Isolde* (1857, performed Munich, 1865); *Die Meistersinger von Nürnberg* (1867, performed Munich, 1868); and *Parsifal* (1882, performed Bayreuth, 1882). Wagner's concept of music drama, set forth in voluminous prose works, envisaged a composite or total art form through the fusion of poetry, music, dance, architecture and painting, and unity of stage and music direction. This concept utilized the art form as a vehicle of propaganda for advancing the German national state. Characteristics of Wagnerian music drama include (1) use of German mythology and folk material in later works; (2) use of "endless melody" (breaking down of the concept of 4-bar melody by avoiding final cadences); (3) chromatic harmony; (4) use of the orchestra as a psychological delineator; (5) use of leit-motif (leading motive) as a guide to identifying characters and situations; (6) increased technique of voice and instruments by enormously new demands; (7) enlarged number of instruments in the orchestra. *Der Ring des Nibelungen* was given for the 1st time in its entirety in

1876 at the Festspielhaus (Festival Theater), conceived, designed, and built under Wagner's direction expressly for the production of his music dramas (the 1st time this had been done in the entire history of music).

1797-1908

FRENCH OPERA. French opera was centered in Paris in the early part of the 19th cent. The grandeur and heroism of the French Revolution were favorite themes. Prominent composers were Luigi Cherubini (1760-1842)—*Médée* (Paris, 1797) in the classic tradition, and *Les Deux Journées* (1800, known in England as "The Water Carrier"), a good example of the "reque" opera; and Gasparo Spontini (1772-1851)—*La Vestale*, 1807.

GRAND OPERA. Influenced by the rising generation of French playwrights (Eugène Scribe, 1791-1886, Victor Hugo, 1802-85; and others), grand opera often took for its subject matter pseudo-historical situations, directing battles and mob scenes toward overemotional effects. *La Muette de Portici*, 1828, by Daniel François Esprit Auber (1782-1871), opened the new era. Exerting enormous influence were Giacomo Meyerbeer (1791-1861)—*Robert le Diable* (1831), *Les Huguenots* (1836), *Le Prophète* (1849), *L'Africain* (1864); Hector Berlioz—*Benvenuto Cellini* (1831-38), *Les Troyens* (1859), *Béatrice and Bénédict* (1862); and Jacques François Halévy (1799-1862)—*La Juive* (1835). An outstanding example of lyric opera was *Faust* (1859), by Charles Gounod (1818-93), while *Manon* (1884), by Jules Massenet (1842-1912), reveals a growing trend toward sentimentalism. Outstanding among composers in lighter vein was Jacques Offenbach (1819-80), whose many operettas influenced light opera for years to come—*Orphée aux Enfers* (*Orpheus in the Underworld*, 1858), *Les Contes d'Hoffmann* (*Tales of Hoffmann*, Paris, 1881). The operatic masterpiece *Carmen* (1875), by Georges Bizet (1838-75), a folk drama of extraordinary power, inspired the subsequent school of veristic Italian opera. *Louise* (1900), by Gustave Charpentier (1860-

1956), was a combination of naturalism, nostalgia, and lyricism.

ITALIAN OPERA. The most celebrated composer of Italian opera in the early 19th cent. was Gioacchino Rossini (1792-1868)—*Barber of Seville* (Rome, 1816), still a sparkling gem of Italian comic opera; *William Tell* (Paris, 1829), in the grand-opera tradition. *Lucia di Lammermoor* (Naples, 1831), by Gaetano Donizetti (1797-1848), is still a vehicle in the repertory for brilliant coloratura sopranos. Also surviving are Donizetti's 2 comic operas, *L'Elisir d'Amore* (Milan, 1832) and *Don Pasquale* (Paris, 1843). Still produced are Vincenzo Bellini's (1801-35) semi-seria opera, *La Sonnambula* (Milan, 1831), and the opera seria, *Norma* (Milan, 1831), both distinguished for their beautiful melodies. Arrigo Boito (1842-1918) completed 1 full opera, *Mefistofele* (Milan, 1868), but his reputation rests chiefly on 2 librettos for Giuseppe Verdi—*Otello* and *Falstaff*—and the libretto of *La Gioconda* (Milan, 1876) by Amilcare Ponchielli (1834-86).

VERDI. Giuseppe Verdi (1813-1901) outranked all composers of Italian opera. Originally following in the traditions of his predecessors, beginning with *Nabucco* (Milan, 1842), he quickly found his own style. Endowed with an unusually fertile gift of melody, using harmony, rhythm, and orchestration with a sure hand (the last never permitted to overshadow the vocal line), and possessing an extraordinary sense of the theater, Verdi composed operas epitomizing dramatic energy and passion. Throwing himself into the struggle of his people to escape the Austrian yoke, he chose subjects for his librettos that, despite the most rigorous censorship, carried meaning and inspiration to his compatriots—*Ernani* (Venice, 1841), *Luisa Miller* (Naples, 1849), and *Rigoletto* (Venice, 1851). The last, along with *Il Trovatore* (Rome, 1853) and *La Traviata* (Venice, 1853), are 3 of the most popular operas of all time. More ambitiously conceived were his operas of the middle period—*Un Ballo in Maschera* (*Masked Ball*, Rome, 1859), *La Forza del Destino* (St. Petersburg, 1862), and *Don Carlos* (Paris, 1867). Verdi composed his

greatest works in his later years—*Aida* (Cairo, 1871), commissioned by the khedive of Egypt for the opening of the Suez Canal; *Otello* (Milan, 1887); and the *opera buffa*, *Falstaff* (Milan, 1892), which appeared in the composer's 80th year.

RUSSIAN OPERA. Russian opera properly begins with *A Life for the Czar* (1836) and *Ruslan and Ludmila* (1842) by Michael Glinka (1804–57), who was inspired by contact with poets and writers of the national literary movement. Aleksandr Sergeyevich Dargomizsky (1813–69), the other outstanding figure among the Russian composers of his generation, produced *Esmeralda* (1847), *Rusalka* (1856), and *The Stone Guest* (*Don Juan*, 1872). Of the Russian 5 (see below), 3 wrote outstanding operas: Aleksandr Porfirovich Borodin (1833–87)—*Prince Igor* (St. Petersburg, 1890); Nicolai Andreyevich Rimsky-Korsakov (1844–1908)—*Mlada* (1890), *Christmas Eve* (1895), *Sadko* (1896), *Czar Saltan* (1896–98), *Kutzh* (1904), *Le Coq d'Or* (1907); all of these works made charming use of Russian fairy tales and folk melodies, and were attractively written for voice and brilliantly orchestrated. Modest Mussorgsky (1839–81), the most distinguished of these operatic composers, whose *Boris Godunov* (1868–69) is a masterpiece and an extraordinary psychological study; and Peter Ilyich Tchaikovsky (1840–93), among whose 11 operas are *Eugene Onegin* (1884) and *Pique Dame* (*Queen of Spades*, 1890).

OTHER OPERATIC COMPOSERS. Other national operatic composers of this period include Bohemian—Bedřich Smetana (1824–81)—*The Bartered Bride*, a comic opera which is a treasure trove of folk song and folk dance; English—outstanding were the operettas of Sir Arthur Sullivan (1824–1900), set to librettos by Sir William Gilbert (1836–1911)—*H.M.S. Pinafore* (1878), *Pirates of Penzance* (1879), *Patience* (1881), *Iolanthe* (1882), *Princess Ida* (1884), *The Mikado* (1885), *Ruddigore* (1887), *Yeomen of the Guard* (1888), *The Gondoliers* (1889); Austro-German—the outstanding composer of operetta in the German language was Johann Strauss, the younger (1825–99),

also famous as a composer of waltzes, as was his father Johann Strauss, Sr. (1804–49), before him—*Die Fledermaus* (*The Bat*, Vienna, 1874).

1854–1927

NATIONALISM. The compulsive desire of various ethnic groups to assert their own cultural identity found forthright expression in music. Richard Wagner, influenced by Carl Maria von Weber, successfully unified music and drama, imbuing his creations with a philosophic concept that was seized by German nationalists (and was subsequently exploited in the 20th cent. in the USSR). In at least 5 of his 15 operas, Verdi chose subjects that inspired Italian patriots to fight Austria.

Nationalism found particular expression in the Russian group known as the "Mighty 5": Aleksandr Borodin (1833–87)—opera, *Prince Igor* (1890); César Cui (1835–1918), Mily Balakirev (1837–1910)—*Islamey* (1869), Modest Mussorgsky (1839–81)—*A Night on Bald Mountain* (1867), *Pictures at an Exhibition* (suite for piano, 1874; orchestrated by Maurice Ravel, 1935), song cycles *Sunless* (1874) and *Songs and Dances of Death* (1875–77), opera *Boris Godunov* (St. Petersburg, 1874, revised and orchestrated by Rimsky-Korsakov, 1896, and also by Dmitri Shostakovich, 1911), opera *Khovantchina* (St. Petersburg, 1886), and Nicolai Rimsky-Korsakov (1841–1908), active as composer, collector of folk songs, orchestrator and teacher, and author of *Foundations of Orchestration* (St. Petersburg, 1913). Rimsky-Korsakov's most widely played orchestral works include *Capriccio Espagnol* (Op. 34, 1887), *Scheherazade* (Op. 35, 1888), his operas include *Sadko* (Moscow, 1898) and *Golden Cockerel* (Moscow, 1909). Russian folk song and dance, although less consciously used, are reflected in the music of Peter Ilyich Tchaikovsky (1840–93), whose outstanding works include Symphonies No. 4 in F minor, Op. 36, 1877, No. 5 in E minor, Op. 64, 1888; No. 6 in B minor, Op. 74, "Pathétique," 1893; Violin Concerto in D major, Op. 35, 1875; Piano Concerto in B

flat minor, Op.23, 1875; programmatic works: the symphonic fantasy, *Francesca da Rimini*, Op.32, 1876; symphonic poems: *Romeo and Juliet*, 1880, and *Manfred*, Op.58, 1885; ballet music from *Swan Lake*, Op.20, 1876, *Sleeping Beauty*, Op.66, 1889, *Nutcracker Suite*, Op.71A, 1892; operas: *Eugene Onegin*, Moscow, 1879, and *Queen of Spades*, St. Petersburg, 1890.

Other Russian nationalist composers include Alexander Glazunov (1865-1936)—Symphony in C minor, Op.58, 1896; Violin Concerto in A minor, Op.82, 1904-15; Alexander Scriabin (1872-1915)—2 symphonic pieces: *Poem of Ecstasy*, Op.54, 1908, and *Prometheus: Poem of Fire*, Op.60, 1910; Sergei Rachmaninov (1873-1943)—Piano Concerto No. 2 in C minor, 1901; No. 3 in D minor, 1909; Symphony No. 2 in E minor, Op.27, 1907; Reinhold Glière (1875-1956)—Symphony No. 3, Op.42, "Ilya Murometz," 1911; ballet *The Red Poppy*, Op.70, Moscow, 1927; awarded Stalin prize twice, 1948 and 1950.

CENTRAL EUROPE. In Central Europe, the songs and dances of Poland were prominent in the piano music of Frédéric Chopin, while the Czech composers Antonin Dvořák and Bedřich Smetana gave distinct ethnic color to their music through the use of indigenous folk material. Smetana's opera *The Bartered Bride* (1866) is considered a folk masterpiece, and his *My Country* (1874-79), a cycle of 6 symphonic poems, includes the well-known epic of *The Moldau*. In addition, Franz Liszt used Hungarian gypsy tunes in his 20 *Hungarian Rhapsodies*, 1851-86.

SCANDINAVIA. Scandinavian nationalist and folk motifs are exemplified in the work of Edvard Hagerup Grieg (1843-1907), with his liberal use of Norwegian songs and dances; also Piano Concerto in A minor, 1868, rev. 1907, and 2 suites from Ibsen's *Peer Gynt*, 1888-91. Denmark is represented by Carl Nielsen (1865-91)—6 symphonies, 3 concertos, 2 operas. Intense Finnish nationalist aspirations are expressed in the tone poems of Jean Sibelius (1865-1957)—*En Saga*, 1892, and *Finlandia*, 1899, and in his 4 legends—*The Swan of Tuonela*, 1893; *Lemmin-*

kainen and the Maidens, 1895; *Lemminkäinen in Tuonela*, 1895; *Return of Lemminkäinen*, 1895—based on the Finnish folk epic *Kalevala*. Sibelius also composed tone poems—*Pohjola's Daughter*, Op.49, 1906, and *Tapiola*, Op.112, 1925—and the Finnish folk idiom is evident in his 7 symphonies, his Violin Concerto in D minor, Op.47, 1903, and his string quartet *Voces Intimae*, Op.56, 1909.

SPAIN. The colorful rhythms and exciting melodies of Spanish folk music are captured by Isaac Albéniz (1860-1909)—*Iberia*, suite of 12 pieces for piano, 1906-9; by Enrique Granados (1867-1916)—opera *Goyescas*, 1916; and by Manuel de Falla (1876-1946)—opera *La Vida Breve*, 1913; ballets *El Amor Brujo*, 1915, and *Three-Cornered Hat*, 1917; and suite for piano and orchestra *Nights in the Gardens of Spain*, 1916.

GREAT BRITAIN. British folk tunes and nationalism are easily recognizable in the music of Sir Edward Elgar (1857-1934)—*Enigma Variations*, Op.36, 1899; oratorio *The Dream of Gerontius*, Op.38, 1900; 5 *Pomp and Circumstance* marches, Op.39, 1901-30, of which No. 2 in D major is world-famous. Other distinguished British composers include Sir Arthur Sullivan (see above); Frederick Delius (1862-1934), who, though influenced by French impressionism and the Norwegian Grieg, used English folk idioms in his symphonic music—*Over the Hills and Far Away*, 1895; *Brigg Fair*, 1907; *In a Summer Garden*, 1908; *On Hearing the First Cuckoo in Spring*, 1913; and in his work for chorus and orchestra, *Sea Drift* (after Walt Whitman), 1903.

1872-1933

FRENCH NATIONALISM AND POST-ROMANTICISM. The founder of the French school of composition based on classical forms, yet featuring a symphonic and leitmotif treatment of lyric drama, was César Franck (1822-90). Among his outstanding works were his oratorios, *Redemption*, 1872, and *Les Béatitudes*, 1880; and his church music, *Mass for Three Voices*, motets, offertories, *Psalm 150*. His major orchestral works include the Sym-

phony in D minor, 1888, and *Symphonic Variations for Piano and Orchestra*, 1885. In addition, he wrote chamber music—Piano Quintet in F minor, 1879; Sonata in A major for Violin and Piano, 1886; String Quartet in D major, 1889; and music for piano and organ, *Trois Chorales*, 1890, as well as songs.

Other outstanding French composers of the time were Vincent d'Indy (1851–1931)—*Symphony on a French Mountain Air*, Op.25, 1886; Symphony in B flat major, Op.57, 1903; symphonic variations, *Istar*, Op.42, 1896; Paul Dukas (1823–92), who survives through his brilliant orchestral scherzo, *The Sorcerer's Apprentice*, 1897; Édouard Lalo (1823–92), skilled violinist and violist—*Symphonie Espagnole* for violin and orchestra, 1875, Concerto in D minor for cello and orchestra, 1877; Emmanuel Chabrier (1841–94)—orchestral rhapsody *España*, 1883; Ernest Chausson (1855–99)—Symphony in B major, 1898, *Poème* for violin and orchestra, 1897; Camille Saint-Saëns (1835–1921), whose works still in the repertory include: opera *Samson et Dalila*, Op.47, 1877; Piano Concerto No. 2 in G minor, Op.22, 1868; Concerto for Cello and Orchestra, Op.33, 1873; tone poem for orchestra *Danse Macabre*, Op.40, 1874; Concerto in B minor for Violin and Orchestra, Op.61, 1880; Symphony in C minor for orchestra with organ and 2 pianos, Op.78, 1886; Gabriel Fauré (1845–1924)—*Requiem*, Op.48, 1887; chamber works: Violin Sonata in A, Op.13, 1876; Piano Quintet in C minor, Op.115, 1921; String Quartet in F minor, Op.121, 1924; incidental music to *Shylock*, Op.57, 1889; musical score for Maeterlinck's *Pelléas et Mélisande*, Op.80, 1898; Henri Duparc (1848–1933), outstanding as an exponent of the French art song—*Chanson Triste*, *L'Extase*, *L'Invitation du Voyage*.

FRENCH IMPRESSIONISM. The French impressionist movement came as a reaction against German romanticism. The French aesthetic spirit, deeply wounded by the defeat in the Franco-Prussian War, 1870–71, retreated into a twilight world best represented in painting by Monet, in poetry by Verlaine and Rimbaud, and in music by Claude Debussy (1862–1918). Debussy expressed his

concern for mood, atmosphere, and color by means of forms of his own invention—freedom of rhythms; modal, pentatonic, and whole-tone scale patterns; suppleness of melody; harmony somewhat influenced by Wagner, yet original in concept. His orchestration was expertly coloristic and delicate in contrast to the broad, heavy, deep strokes and colors of the German school. His orchestral works include *Prélude à l'Après-midi d'un Faune*, 1894; 3 *Nocturnes*, 1899; *La Mer*, 1905; works for piano: *Estantes*, 1903, *Images*, 1905–7, *Préludes*, 1910–11; opera: *Pelléas et Mélisande* (after Maeterlinck's play), 1902; choral works: *L'Enfant Prodigue*, 1884; *La Damselle Édue*, 1888; *Le Martyre de Saint Sébastien*, 1911.

The other leading exemplar of this school was Maurice Ravel (1875–1937). Influenced by Debussy's impressionism, Ravel combined classic forms, clear-cut melodic line, substantive harmony, and more precise rhythms in his music. His numerous compositions include, for piano—*Jeux d'Enfant*, 1901; *Sonatine*, 1905; *Gaspard de la Nuit*, 1908; *Pavane pour une Enfant Défunte*, 1899 (arranged later for orchestra); chamber music—String Quartet, 1903; Introduction and Allegro for harp, string quartet, flute, and clarinet, 1906; Piano Trio, 1915; Cello Sonata, 1922; Violin Sonata, 1927; ballets—*Daphnis et Chloé*, 1912; *Ma Mère l'Oye* (from suite for piano duet), 1915, operas—*L'Heure Espagnole*, 1907; *L'Enfant et les Sortilèges*, 1925; for orchestra—*Rhapsodie Espagnole*, 1907; *La Valse*, 1920; *Boléro*, 1928; Concerto for Piano (left hand alone) and Orchestra, 1931; Concerto for Piano and Orchestra, 1931; orchestral arrangement of Mussorgsky's *Pictures at an Exhibition*, 1922.

POSTROMANTICISM. The outstanding composers of the postromantic period were Gustav Mahler (1860–1911) in the field of the symphony and Richard Strauss (1864–1947), 1st in the tone poem and subsequently in German opera. Mahler encompassed in his symphonies lyricism (the folk songs and dance tunes of his native Bohemia permeate his music), the chromatic harmony of Wagner (somewhat refined), a loosening of the symphonic form, a characteristic polyph-

ony, and extraordinary sensitivity and mastery of the orchestra, using full-scale orchestral resources and extended instrumental techniques. Inherent in his work is a deep religiosity and an attempt to communicate philosophic principles. His works include Symphony No. 1, "Titan," 1888; Symphony No. 2, "Resurrection," 1894, No. 3, 1895, No. 4, 1900; No. 8, "Symphony of a Thousand" for expanded orchestra, choir, 8 solo voices, double chorus, boys' chorus, and organ, 1907; *Das Lied von der Erde* for solo voices and orchestra, 1908, also many songs and song cycles.

Gifted with a fertile imagination, extraordinary dramatic sense, and a brilliant mastery of orchestral technique, Richard Strauss 1st achieved fame with his series of tone poems: *Don Juan*, 1888; *Tod und Verklärung*, 1889; *Till Eulenspiegel*, 1895; *Also Sprach Zarathustra*, 1896; *Don Quixote*, 1897; *Ein Heldenleben*, 1898; *Symphonia Domestica*, 1903. His most important operas are *Salome*, 1903; *Elektra*, 1909; *Der Rosenkavalier*, 1911; *Ariadne auf Naxos*, 1912; *Die Frau ohne Schatten*, 1919. Among the loveliest of his many songs are his last compositions, *4 Last Songs*, with orchestra, 1947.

1890-1958

ITALIAN OPERA TRENDS. The style of the period was primarily *verismo*, in which everyday life was presented realistically. Exemplars include Pietro Mascagni (1863-1945)—*Cavalleria Rusticana* (Rome, 1890); Ruggiero Leoncavallo (1858-1919)—*I Pagliacci* (Milan, 1892); Umberto Giordano (1867-1948)—*Andrea Chénier* (Milan, 1896). Most important of Italian composers after Verdi was Giacomo Puccini (1858-1924), whose operas, still outstandingly popular in the current repertory, reveal an unsurpassed ability to write for both voice and orchestra—*Manon Lescaut* (Turin, 1890); *La Bohème* (Turin, 1896); *Tosca* (Rome, 1900); *Madame Butterfly* (Milan, 1904); *The Girl of the Golden West* (New York, 1910); *Turandot* (completed by Franco Alfano, Milan, 1926). Other operatic composers include Italo Montemezzi (1875-1952)—*L'Amore dei Tre Re*

(Milan, 1913); Ildebrando Pizzetti (1880-1968)—*Murder in the Cathedral* (based on T. S. Eliot's play, 1958). The leading Italian composer of symphonic music in this period was Ottorino Respighi (1879-1931)—*Fountains of Rome*, 1917, *Pines of Rome*, 1924, *Roman Festivals*, 1929—works incorporating Italian color with the impressionism of Debussy, the postromanticism of Strauss, and the brilliant orchestral technique of Rimsky-Korsakov.

U.S. COMPOSERS. In this period, U.S. composers reflected nationalist influences and impressionism. Although influenced by his German romantic musical training, Edward MacDowell (1861-1908) sought to express American nationalistic feeling in such works as Suite No. 2 ("Indian") for Orchestra, Op.48, 1895; *Woodland Sketches* for piano, Op.51, 1896; *New England Idyls* for piano, Op.62, 1902; Piano Concerto No. 2 in D minor, 1889. For his time an extraordinary innovator, Charles Ives (1874-1954) used polytonality, cross rhythms, quarter tones, dissonances (together with, on occasion, quite conservative harmony), and consciously drew upon American folk subjects in his Sonata No. 2 for piano ("Concord, Mass., 1840-1860"), 1915; the symphonic piece *Three Places in New England*, 1914; Symphony No. 3, 1904, rev. 1911 (awarded Pulitzer prize, 1947). Charles Martin Loeffler (1861-1935), whose work was dominated by impressionist influences, left *A Pagan Poem* for piano and orchestra, 1905-6. Similar influences, along with motifs from Asia, are reflected in the works of Charles Tomlinson Griffes (1884-1920)—*White Peacock* from *Four Roman Sketches*, 1914; *Poem for Flute and Orchestra*, 1918; *Pleasure Dome of Kublai Khan*, 1919.

20th Cent.

1900-1968

NEW MUSICAL TRENDS. 20th-cent. music has been composed in the spirit of change. Although cognizant of tradition, composers have endeavored to write present-minded music, and even to project into the future. This point of view has

manifested itself in different uses of the elements of music: melody seldom composed in symmetrical phrases, but frequently instrumental in concept, with jagged leaps rather than a consonant vocal line; harmony becoming increasingly complicated and dissonant, rhythms similarly more complicated and irregular, chromaticism, polytonality (simultaneous use of many keys), and atonality (absence of a tonal center) becoming common; form becoming freer, yet the old baroque and classic forms used, texture frequently polyphonic (many-voiced) instead of largely homophonic (melodically dominated); orchestration becoming more involved, yet expressive, with the techniques of older instruments and the human voice extended and newer, electronic instruments introduced; style affected by contemporary painting and literature—primitivism, objectivism, urbanism, sports, ballet, humor, satire—and resulting in neoclassicism, neoromanticism, neonationalism, and expressionism (the attempt of the artist to use the inner experience or subconscious as the only reality).

EXPRESSIONIST COMPOSERS. Expressionist composers include Arnold Schoenberg (1874–1951), best known for such 12 tone compositions, 1921–33, as the following: Five Pieces for Orchestra, Op.23, Suite for Piano, Op.25; Serenade for 7 Instruments and Bass Baritone, Op.24, Quintet for Wind Instruments, Op.26, String Quartet No. 3, Op.30; Variations for Orchestra, Op.31. His earlier nonatonal works include *Verklärte Nacht*, 1899, and *Gurre-Lieder*, 1901–2, and the more experimental music dramas, *Die Gluckliche Hand*, Op.18 1913, and *Pierrot Lunaire* for Sprechgesang and instruments, Op.21, 1912. Later more conservative works include Violin Concerto, Op.36, 1936, and *A Survivor from Warsaw* for narrator, male chorus, and orchestra, Op.46, 1947. Alban Berg (1885–1935), a pupil of Schoenberg, composed the operas *Wozzeck*, 1921, and *Lulu*, 1937; 3 Orchestral Pieces; Chamber Concerto for piano, violin, and 13 wind instruments; String Quartet; Lyric Suite for string quartet; and Sonata for piano. Anton von Webern (1883–1945), also a Schoenberg

pupil, used pointilist technique, frequent rests, and low dynamic level in his works, which include 6 Pieces for Orchestra, Op.6, 1909; 5 Pieces for Orchestra, Op.10, 1913; Symphony for Chamber Orchestra, Op.21, 1928.

NEOCLASSIC COMPOSERS. Prominent among the neoclassicists is Igor Stravinsky (b. 1882). His early works—*Fireworks for Orchestra*, 1908, and the ballet *Firebird*, 1910—reveal the influences of his teacher Rimsky-Korsakov, but he has been constantly evolving different styles. Other works include the ballets *Petrouchka*, 1911, and *Le Sacre du Printemps*, 1913. The larger part of his output falls into the neoclassic category: *Les Noces* (with chorus), 1923; *Histoire du Soldat* (with speaking voice), 1918; the operas *Rossignol*, 1914, *Mavra*, 1922, and *Rake's Progress*, 1951; opera oratorio *Oedipus Rex*, 1927; orchestral works: Symphony for Wind Instruments, 1920, Symphony in C, 1940, Symphony in 3 Movements, 1942; concertos, *Dumbarton Oaks*, 1938, Concerto for String Orchestra, 1946, Concerto for Piano and Wind, 1924, Violin Concerto, 1931; choral works: *Symphony of Psalms*, 1930, Mass, 1948, *Canticum Sacrum*, 1956, *Threni—Id Est Lamentationes Jeremiae* (in 12-tone technique), 1958; *The Flood* (ballet for pantomime with narrative, written for television), 1962.

Paul Hindemith* (1895–1963) was associated with the idea of *Gebrauchsmusik* ("music for use"). His works include Sonata No. 3 for piano, 1936; 3 Sonatas for organ, 1937–40; Symphony in B flat for Band, 1951; *Ludus Tonalis* for piano, 1943, symphony *Mathis der Maler*, 1934; *Nobilissima Visione* for orchestra, 1938; *Symphonic Metamorphosis on Themes of Weber*, 1945; song cycle, *Marienleben*, 1923, rev. 1948.

Carl Orff (b. 1895) found the inspiration for his cantata *Carmina Burana* (Frankfurt, 1937) in the 13th-cent. song manuscripts which were discovered at the Bavarian monastery of Benedictbeuren. He has since incorporated that work into the triptych *Trionfi* (Milan, 1953) for soli, chorus, and instruments, with scenery.

Béla Bartók (1881–1945) was an avid

collector of Central European folksongs, the influences of which are prominent in his music. His compositions include an opera, *Duke Bluebeard's Castle*, 1911; ballet, *The Wooden Prince*, 1914-16; pantomime, *The Miraculous Mandarin*, 1919; set of studies for piano, *Mikrokosmos*, 1926-37; Rhapsody No. 1 for cello and piano, 1928; *Cantata Profana* for chorus and orchestra, 1930; Music for Strings, Percussion, and Celesta, 1936; Sonata for 2 Pianos and Percussion, 1937; Concerto for Orchestra, 1943-44; 6 string quartets; 2 violin sonatas; 3 piano concertos; and many arrangements of folksongs for voices and instruments.

Zoltán Kodály (1882-1967) also used much Hungarian folk material in his music, including *Psalmus Hungaricus* for chorus and orchestra, 1923, and the suite from his ballad opera *Háry Janos*, 1926.

NATIONALIST COMPOSERS. In the USSR art has always been a political concern, and artist and composer have been expected to adhere to the aesthetic credo of socialist realism. Composers who, despite political limitations, have achieved world recognition are Sergei Prokofiev (1891-1953)—Symphony No. 1 ("Classical"), Op.25, 1918; Symphony No. 5, Op.100, 1944; Symphony No. 6, Op.111, 1944; Symphony No. 7, Op.131, 1952; Piano Concerto No. 3 in C major, Op.26, 1921; 2 violin concertos—No. 1 in D major, Op.19, 1914, and No. 2 in B minor, Op.63, 1935; opera *The Love for Three Oranges*, Op.33, 1921; orchestral suite from the movie *Lieutenant Kije*, Op.60, 1934; *Peter and the Wolf*, for narrator and orchestra, Op.67, 1936; ballet *Romeo and Juliet*, Op.64, 1935-36; Dmitri Shostakovich (b. 1906), noted for 12 symphonies, including No. 1, Op.10, 1925; No. 5, Op.47, 1937; No. 7, Op.60, 1941; opera *Lady Macbeth of Mzensk*, 1934; ballet *The Age of Gold*, Op.22, 1930.

British composers who have developed characteristic British music, using British folk tunes and dances in their compositions, include Ralph Vaughan Williams (1872-1958)—*A London Symphony* (No. 2), 1914, rev. 1920; *Pastoral Symphony* (No. 3), 1922; Symphony No. 4 in F minor, 1935; Symphony No. 5 in D major,

1943; Symphony No. 8 in D minor, 1956; Symphony No. 9 in E minor, 1958; *Fantasia on a Theme of Thomas Tallis*, 1910; Gustav Holst (1874-1934)—orchestral suite *The Planets*, Op.32, 1916; Benjamin Britten (b. 1913)—operas *Peter Grimes*, Op.33, 1945, *The Turn of the Screw*, Op. 54, 1954, and *A Midsummer Night's Dream*, Op.64, 1960; choral works *A Ceremony of Carols*, Op.28, 1942, and *War Requiem*, 1962; orchestral work *The Young Person's Guide to the Orchestra*, Op.34, 1945.

Of the French composers who rebelled against French impressionism, the following are notable: Erik Satie (1866-1925)—*Ballet Parades*, 1917; and 3 composers of the group called *Les Six*: Francis Poulenc (1899-1963)—religious opera *Les Dialogues des Carmélites*, 1957, *La Voix Humaine*, 1958, Darius Milhaud (b. 1892)—ballet *La Création du Monde*, 1922; operas *Christophe Colomb*, 1930, and *Bolivar*, 1950; *Sacred Service for Synagogue*, 1947; Arthur Honegger (1892-1955)—*Pacific 231* ("Locomotive") for orchestra, 1923; oratorio, *Le Roi David*, 1921.

AMERICAN MUSICAL TRENDS.

American jazz, which originated in New Orleans in the early part of the 20th cent., spread to northern cities of the U.S. by 1917, when "King Oliver" (1885-1938) moved his band to Chicago, followed in 1922 by Louis ("Satchmo") Armstrong (b. 1900), and since has had an enormous impact on world music. A blend of Afro-American songs, blues, and spirituals, ragtime, Appalachian folksongs, and religious hymns, jazz has passed through many transformations: boogie-woogie, swing, bop, cool jazz, and rock 'n' roll (from 1954), and is constantly being further transformed. Other outstanding jazz figures are Duke Ellington (b. 1899); Benny Goodman (b. 1909), who introduced the era of "swing" in the 1930's, along with such "swing" artists as Harry James (b. 1916) and "Count" Basie (b. 1904); "Dizzy" Gillespie (b. 1917), protagonist in the early 1940's of "bop"; and Dave Brubeck (b. 1920), popularizer of "cool" jazz. An annual jazz festival was established at Newport, R.I., in 1954.

Increasing popularity of folk music is a worldwide phenomenon. In the U.S. such music is primarily rooted in early Appalachian folk, work, hillbilly, and cowboy songs. In the 1960's Tennessee country music influenced English groups such as "The Beatles" (George Harrison, John Lennon, Paul McCartney, and Ringo Starr), and they in turn have affected popular music in the U.S. Aside from traditional ballad themes, a major source of material is found in songs of protest, expounding pro-civil rights and anti-Vietnam War sentiments.

A successful blending of jazz elements and classic forms was achieved by George Gershwin (1898-1937) in his *Rhapsody in Blue* for piano and orchestra, 1924; *Concerto in F*, 1925, *An American in Paris*, 1928, and his folk opera *Porgy and Bess*, 1935. Among the composers who have consciously incorporated American folk and nationalist materials in their compositions are Aaron Copland (b. 1900) — *Lincoln Portrait*, for narrator and orchestra, 1942, ballets *Rodeo*, 1938, *Billy the Kid*, 1942, and *Appalachian Spring*, 1945; and Roy Harris (b. 1898) — *Symphony No. 3*, 1939. Other U.S. composers include Samuel Barber (b. 1910) — *Adagio for Strings*, 1936; *Concerto for Violin*, 1940; *Concerto for Piano*, 1962, operas *Vanessa*, 1956, and *Anthony and Cleopatra*, 1966, and Gian-Carlo Menotti (b. 1911 in Italy but active in American opera) — *The Medium*, 1946, *The Consul*, 1950, *Amahl and the Night Visitors* (1st opera composed for television), 1951, *The Saint of Bleeker Street*, 1954; and Leonard Bernstein (b. 1918), distinguished also as conductor and educator — *Jeremiah Symphony*, 1942, *Age of Anxiety*, 1949, *Kaddish Symphony*, 1963, the stage musical *West Side Story*, 1957.

EXPERIMENTALISM. Among experimentalists who have influenced the more recent composers are Henry Cowell (1897-1967), who attracted attention in the 1920's with his "tone clusters"; Edgar Varèse (1855-1965), whose *Ionisation*, 1931, scored for 35 percussion and friction instruments, played by 13 performers, anticipated later developments; and John Cage (b. 1912), who in his early works

used percussion instruments and prepared piano. Cage's later works, based on the concept of chance, stimulated a cult of composers of aleatory music in which silence was regarded as compositional material.

ELECTRONIC MUSIC. The most significant contribution to the expansion of the vocabulary and tonal resources of 20th-cent. music has been in the field of electronics. Electronic music, based on techniques that generate, transform, and manipulate sounds electronically, came to attention in the 1950's. Three principal schools, French, American, and German, pioneered its development. Under the direction of Pierre Schaeffer (b. 1910), the French school developed a research center at Radiodiffusion Française, and included the composers Olivier Messiaen (b. 1908) and Pierre Boulez (b. 1925). The American school has been centered at Columbia University under the direction of Otto Luening (b. 1900) and Vladimir Ussachevsky (b. 1911). In 1959 the Columbia-Princeton Electronic Center was established. Milton Babbitt (b. 1916), a 12-tone composer, joined the group. The German school centers in the studio of West German Radio in Cologne, where experiments have been conducted under the direction of Herbert Eimert. Prominent in this latter group is Karlheinz Stockhausen (b. 1928).

LATIN AMERICA, AFRICA, AND ASIA

1760-1968

LATIN AMERICAN MUSIC. The distinctive character of Latin American music results from a syncretic fusion of Indian, African, and European elements. Here the classical distinction between traditional folk and popular (commercial) music is not valid, for tunes and rhythms pass freely from the folk to the urban popular composer and back again to the folk. The varied history and diverse ethnic population of the nations of South and Central America make any generalization subject to interpretation for each country. The immigration of

Europeans during the 19th and early 20th cents. dominated the musical life of the cities with a strong Italian influence, music clubs were formed, conservatories established, and concerts and opera performances organized. Composers went to Italy and France to further their studies and it was not until the 20th cent. that they began to speak musically in their native tongue. A wide diversity of styles is to be noted in contemporary music. While some composers have localized their music and given it a Latin American color through the use of indigenous idioms and native instruments, others have elected to write in an international style.

Foremost among the 20th-cent. composers who have achieved international recognition are the Brazilian Heitor Villa-Lobos (1881-1959), composer of a total of 2,000 works, including the symphonic poem *Amazones*, 1917; ballet *Urupurú*, 1935; *Dança da Terra*, 1943; *Chôros* (serenades combining Brazilian, Indian, and popular elements) for guitar, 1920, for flute and clarinet, 1921, for male chorus and 7 wind instruments, 1925; for piano, *Prole do Bibê* (*Baby's Family*); choral *Vidapura*, 1918; also *Bachianas Brasileiras*, for soprano and 8 cellos, 1938, 1945; the Mexicans Carlos Chávez (b. 1899)—symphonies *Sinfonia India*, 1936, No. 3, 1951, No. 4, 1952, No. 5 ("Symphony for Strings"), 1953; and Sylvestre Revueltas (1899-1940); the Argentinian Alberto Ginastera (b. 1916)—ballets *Panamambi*, 1940, and *Estancia*, 1941; *Sinfonia Porteña*, 1942; opera *Bommarzo*, 1966; and the Chileans Domingo Santa Cruz (b. 1899) and Juan Orrego-Salas (b. 1919). Notable ethnological musical research into indigenous Indian and mestizo music has been done by Carlos Vega (1898-1966) for the Argentine Museum of Natural Sciences, Isabel Aretz and L. F. Ramón y Rivera at the Instituto de Folklore, Caracas, Venezuela, and others. The Inter-American Music Council (CIDEM); the Music Division of the Pan American Union, Washington, D.C., under the direction of Guillermo Espinosa (b. 1905); the Inter-American Institute for Musical Research Tulane University, New Orleans; and the

Latin American Music Center, Indiana University, Bloomington, Ind., have organized conferences and festivals which have promoted the development and exchange of musical ideas and research findings throughout the Western Hemisphere.

The infectious rhythms of Latin American dances have gained for them a worldwide distribution and strong influence on the contemporary popular music of other countries. Most popular among these dances are the tango, congo, rumba, samba, and bossa nova.

AFRICA. 18th- and 19th-cent. reports of travelers and missionaries give an amateurish and often prejudiced impression which is of limited value in reconstructing African music prior to 1900. However, the vitality of the music tradition is so great and the integration of music and dance with tribal life so complete that one may assume that the music of the past 2 centuries did not differ greatly from the traditional music of today. It was not until 1900 that South African musicians performed for Otto Abraham in Berlin. Since that time the collection, description, and analysis of African music has occupied a number of ethnomusicologists. Erich M. von Hornbostel's *Phonographierte Tunesische Melodien* (*Recorded Tunisian Melodies*, 1906) was the 1st collection to be published, but it was not until after World War II that the use of magnetic tape, replacing the earlier cylinders and disks, made possible the improved recording of entire ceremonies and extended pieces of music. *African Music from the Source of the Nile*, 1956, by Y. Kyagambiddwa (Uganda), and *Funeral Dirges of the Akan People*, 1955, by J. H. Nketia (Ghana), are pioneer attempts by African scholars to notate, analyze, and explain their indigenous music. The establishment of institutes for African studies and centers for ethnomusicological research in European and American universities has provided resources and material for continuing work in a field of study only recently recognized. The African Music Society was founded, 12 Aug., 1947, in Roodepoort, South Africa.

ASIAN MUSIC. The Asian continent is home to so many diverse cultures that it is impossible to treat its music as a whole. Through the centuries there has been cultural exchange between ethnic and national groups, but despite such contacts there have emerged national styles of music that are distinct.

INDIA. The music of India is the oldest living music in the world and one of the most sophisticated. Based on the concepts of the *raga*, a melodic pattern with a distinctive ethos that serves both as scale and subject matter for composition, and of the *tala*, a rhythmic formula that gives organization to the music in time, Indian music has remained melodic-rhythmic in nature through millennia of development. It is thus quite different from the music of the western world, which, by contrast, is harmonic and polyphonic in concept. The continuity of the musical tradition in India was not affected by British rule, although the introduction of military music and European folk song occasionally intrigued an Indian composer and caused him to adapt a foreign tune to his native musical idiom. Both the Hindustani music of the north and the Karnatic music of the south trace their origin to the *Samaveda*, the musical version of the *Rigveda*. They are in agreement on fundamentals, though the nomenclature of *ragas* and *talas* differs. Today the difference between them is largely a matter of style. Instrumental music is more developed in the north.

The late 18th cent. gave birth to 3 great composers, Tyagaraja (1767-1847), Muthuswamy Dikshitar (1776-1835), and Syama Sastri (1762-1827), often referred to as "the Trinity." Their compositions (with texts in Telugu, Sanskrit, and Tamil), together with the works of Purandara Dasa (1484-1564), constitute the core of the Indian artist's repertory. It is in this period that the necessity for evolving an accurate system of notation arose. Earlier, music had been passed on by rote from master to pupil. In 1873 Tachur Singaracharlu began publishing graded books on music. The published works on Indian music in English by P.

Sambamoorthy (b. 1901) affected music education at all levels, not only in India, but throughout the world.

With the attainment of independence, 15 Aug., 1947, Indians took a new interest and pride in their musical heritage. National and state music academies (Sangeet Natak Akademi) were established for the recording, archiving, study and publication of works from the various musical cultures—tribal, folk, and classical. State government music schools, private academies, and the music departments of colleges and universities began to offer courses in history, theory, and practice of Indian music. The popularity of the cinema gave rise to a new genre, film music, which reflected considerable foreign influence.

CHINA. The long-established tradition of imperial interest in music was followed by the Ch'ien Lung emperor (ruled 1736-95), under whose auspices 128 chapters were added to *Lu Lü Cheng I*, 1746, an encyclopedia on music theory (including a chapter on western music); 1st published under the auspices of the K'ang Hsi emperor in 1713.

• Ceremonial music (*ya yüeh*) flourished until the middle of the 19th cent., when continuous internal rebellion and invasions by western powers caused its decline. After the downfall of the Ch'ing Dynasty, 1911, the practice of *ya yüeh* was discontinued. Thus a great tradition, established in the Chou Dynasty and perpetuated by all major dynasties of the past, passed into oblivion.

Music drama (*k'un ch'ü*), which was developed by Wei Liang-fu in the middle of the 16th cent. and was already in a state of decline by the end of the Ming Dynasty, 1368-1661, enjoyed a revival during the Ch'ing, 1662-1911. In 1776 the Ch'ien Lung emperor summoned 4 provincial drama troupes to Peking, paving the way for the emergence of *Ching hsi* (the so-called Peking opera), which represented a merger of the various regional drama schools. However, *Ching hsi* did not achieve its great popularity until after 1821, when it gradually replaced the declining classical school, *k'un ch'ü*, as the predominating school of music drama in

China. Meanwhile, *k'un ch'u* persisted as a revered classical drama school and later enjoyed a slow revival in its popularity after the revolution of 1911. A very popular collection, *O Yun Ko Ch'u P'u*, was published as late as 1870.

In the field of solo and ensemble music, the *ch'in* (*koto* or *kin* in Japanese, and *kum* or *kumunko* in Korean), a fretted long zither, has maintained an uninterrupted tradition as the instrument cultivated by scholars and artists. Publication of treatises on the instrument and collections of its music have continued to the present. It has enjoyed some degree of popularity with the public since the revolution of 1911, an important publication, *Ch'in Hsueh Ts'ung Shu*, being compiled in 1911-31. The *p'i p'a* (*biwa* in Japanese), a short 4-stringed lute, has always been an important instrument in ensemble music and in certain types of dramatic music, but it did not emerge as a solo instrument until the early 19th cent. The 1st collection of *p'i p'a* music, Hua Ch'u Ping's *P'i P'a P'u*, was published in 1819. A popular collection, Li Tsu Fen's *P'i P'a Hsin P'u*, appeared in 1895, and other collections have been published since the revolution of 1911. The *p'i p'a* now shares with the *ch'in* the 1st position among Chinese solo instruments.

A parallel interest in other instruments and ensemble music is represented by the publication of important treatises and collections, notably *Hsuan So Shih San T'ao* (*Thirteen Compositions for Strings*), 1782, and *Hsuan So Pei K'ao* (*A Study of Music for Strings*), 1814. This led to a revival of interest in ensemble music, particularly the type known as *szu cho* (music for strings and winds). Although not comparable with the great orchestral music of the past, *szu cho* nevertheless became a popular category in the so-called *kuo yüeh* (a modern term meaning "national," i.e., "traditional," music), and was encouraged by the government and by persons interested in preserving traditional music. During the Nationalist regime a strong effort was made to reform traditional music. The *szu cho* ensemble was expanded into the so-called *kuo yüeh t'uan* (national music orchestra). After the establishment of the People's Repub-

lic, 1949, this reform was intensified. Under the Communist regime all forms of traditional music, except *ya yüeh*, which is not a secular form, have been actively revived. Musicological research has been encouraged and an impressive number of publications in this field have appeared from the mid-1950's onward.

JAPAN. A spirit of nationalism in the Tokugawa period, 1603-1867, began to supplement the intercultural influences which had affected Japanese music in earlier times. Three new genres emerged—*shamisen*, *koto*, and *shakuhachi*—which were held in great esteem by the merchants and artisans in the cities. The *koto*, a long zitherlike instrument with 13 silk strings, each tuned by a movable bridge, was regarded as the 1st instrument for accompanying songs as well as being a solo instrument in its own right. The *shamisen*, a 3-string banjolike long-necked lute, was employed in 3 styles of music: *Uta-mono* (singing style), *Kotōri-mono* (narrative style), and *Min'yo* (folk song). The *shakuhachi*, an end-blown or vertical bamboo flute, played by itinerant Buddhist priests in the Middle Tokugawa period, was adapted to solo art music. At the close of the period the 3 instruments were joined together, thus establishing an ensemble style of music called *sankyoku* (3 instruments).

Gagaku, the ancient court music of Japan, represented a synthesis of Chinese, Korean, Indian, and indigenous influences. Established in the early half of the 9th cent., it has been preserved to the present day at the imperial court and in some shrines and temples, although it suffered a decline following the Meiji Restoration of 1868. The repertory today consists of instrumental ensemble (*Kan-gan*), dance music (*Bugaku*), songs, and ritual music for Shinto ceremonies. The latter category is restricted to religious use, but the remaining pieces are secular and are played at court ceremonies and banquets. At present the *Gagaku* orchestra is divided into 2 groups—*saho* (left) and *uho* (right)—the former consisting mainly of music from China and, to a smaller extent, from India, the latter of music from Korea and Manchuria. The instrumentation of *Saho Kangan* consists

of ryuteki (flute), hichirick (oboe), sho (mouth organ), so (zither), biwa (lute), kakko (side drum), shoko (gong), and taiko (big drum).

Genres of traditional music which have been preserved into the present include shomyo (Buddhist chanting), biwa music,

nohgaku (music of the No drama), and kabuki music. The development of Japanese music has been influenced by the dominant position of vocal modes, and a teacher-student relationship which is a special feature of the music system.

Fine Arts and Architecture

PAINTING

1789-1830

THE CLASSIC-ROMANTIC PERIOD.

In the late 18th cent. Paris, with its many painters and its regularly held salons, was the greatest European center of painting, though the latest wave of enthusiasm for antiquity which spread in the wake of the excavations at Herculaneum and Pompeii meant that Rome was still a source of inspiration for artists as it had been since the 17th cent. Jacques-Louis David (1748-1825), whose *Oath of the Horatii*, 1785, was a symbol of the new revolutionary virtues in ancient Roman form, won the coveted Prix de Rome, 1774, and spent several years there, returning to become the champion of the neoclassical ideal of academic drawing, composition, and highly finished surface, and of subjects drawn from classical sources. David had a powerful realist vision. His portraits set a new standard of vitality, and in such works as the *Death of Marat*, 1793, and the *Coronation of Napoleon*, 1808, he participated in a new expansion of history painting to include subjects of current political importance. But his dominant influence, made powerful through his high position under Napoleon and his studio teaching as well as by such works as *The Rape of the Sabines*, 1795-1800, was on the side of neoclassicism. Such immediate followers of David as François Gérard (1770-1837), Anne Louis Girodet de Roucy (1767-1834), and Pierre-Narcisse Guérin (1774-1833) maintained a smooth sculptural style and relieflike composition, often in subjects drawn from classical sources (Guérin's *Return of Marcus Sextus*, 1799; Gérard's *Cupid and*

Psyche, 1798), but increasingly influenced by romantic literature, as in Girodet's *Entombment of Atala*, 1808, derived from Chateaubriand. David's greatest pupil was Jean Auguste Dominique Ingres (1780-1867), who during a long life kept alive at least in theory the qualities of classical form and the tradition of the Academy. *The Apotheosis of Homer*, 1827, was an image of the classical tradition, though his great nudes (*L'Odalisque*, *Le Bain Turque*) betray a romantic intensity. For Ingres classicism was a bulwark against chaos, both personal and social. Like David, he was one of the greatest of portraitists; in fine pencil drawings as well as in paintings (M. Bertin, Mme. d'Haussonville) he recorded the character of the 19th-cent. *haute bourgeoisie*.

TRENDS IN ROMANTICISM. The new forces, beginning c. 1800, which challenged neoclassical principles and modified their practice grew gradually more powerful as the Napoleonic Wars exercised their unsettling effect throughout Europe. Some of the general characteristics of the new movement were (1) a feeling for the national past, with heroes taken from among the knights and princes of European history rather than from Greece or Rome; (2) a feeling for one's own locality, expressed in a new landscape realism; (3) a new value placed on the experience of strong dramatic feeling, whether in subject or in composition and color; and (4) a growing preference for the particular over the general, and for observation over formulas.

SPAIN. Francisco de Goya y Lucientes (1746-1828), coming out of the baroque tradition of Velasquez and Tiepolo, developed a powerfully anticlassical, expres-

sionist style which was one of the foundations of romanticism and ultimately of modernism. Beginning as a bravura court painter, his unsparing realism later overcame flattery in his royal portraits. His *Caprichos*, 1796-98, reveal a wealth of dark, unconscious imagery, as well as a mastery of the etching medium. In the series of etchings known as the *Disasters of War*, 1810-13, Goya expressed his horror of the French campaign in Spain by vividly describing the wretchedness of its victims, and his *Second of May*, 1813, was a statement of the evil that mankind inflicts upon itself. More than anyone else of his time he made of painting a powerful instrument for the expression of deep emotions.

ENGLAND. The greatest contribution of the English to the new era in painting was in the development of landscape painting, and the consequent interest in qualities of light and atmosphere. Joseph Mallord William Turner (1775-1851) began in the established English tradition of fine topographic description, but became increasingly involved with the complex and ephemeral experience of light, particularly of light and water (*Burning of the Houses of Parliament*, 1833). His later pictures (e.g., *Rain, Steam and Speed*, 1844) are almost formless in the traditional sense because the artist has been true to the actual experience of the dissolving of solid form by atmosphere, light, and movement. Where Turner's temperament inclined him toward the drama of landscape and weather and toward the exotic, John Constable (1776-1837), who was imbued with a Wordsworthian reverence for the simplest natural facts, devoted himself to the quieter subtleties of the English countryside, particularly around his Sussex home of East Bergholt. His *Hay Wain*, shown at the Salon in Paris of 1824, was an inspiration to Delacroix and other French artists because of the lightness of its palette, which placed it in strong contrast to the traditionally brown-toned studio landscapes of the time. In addition to their oils, both Constable and Turner made many studies and paintings in water color, a medium highly suited to fresh color, effects of light, and immediacy of

impression, and some of these qualities were incorporated into their work in oil. At this period in England the art of water-color painting was highly developed, most notably in the work of the Norwich School—John Crome (1768-1821), John Sell Cotman (1782-1842), Peter de Wint (1784-1849), and many others. Richard Parkes Bonington (1802-28) also came out of this water-color tradition, and his many paintings of French coastal scenes formed a link between the English school and the later development of atmospheric painting in France. From an entirely different milieu and exemplifying a quite different attitude were William Blake's (1757-1827) highly personal linear engravings and water-color drawings used to illustrate his own hermetic mythological poetry as well as the works of Milton and Dante. Other artists in England, including the Swiss Henry Fuseli (1741-1825), George Romney (1734-1802), and John Martin (1789-1854), though not visionaries like Blake, also responded to the awakening interest of the period in early literature. The works of Shakespeare, in particular, who had long been the target of classical critics, now provided themes for many paintings.

GERMANY AND AUSTRIA. Romantic art in Germany combined a sharp linear realism of technique with symbolism and religious nostalgia. Philipp-Otto Runge (1773-1810) in his *Times of Day*, 1805-8, attempted like Blake to create a personal cosmic symbolism, while Caspar David Friedrich (1774-1840) used the Christian symbolism of the Cross and the Gothic church in order to express a sense of the isolation of the soul in the world (*The Cross on the Mountain*, *The Ruined Abbey*). Frederick Overbeck (1789-1869) and his disciples founded an ascetic community of artists in Rome, called the Nazarenes, whose ideal of the stylistic and religious purity of Italian painting before Raphael was to influence a later generation of English artists.

FRANCE. Though trained by David, Baron Gros (1771-1855) expressed the romantic spirit in panoramic scenes of contemporary battle (*Napoleon at Eylau*, 1808). In the *Pesthouse at Jaffa*, 1804, Napoleon is seen as a national and reli-

gious hero rather than as a nobly classical one, and the viewer is not spared the details of the sick men's sufferings. Théodore Géricault (1791–1821) carried this intense psychological realism further in his studies of old and insane people and in his *Raft of the Medusa*, 1819, which made of a contemporary shipwreck a dramatic image of human courage and suffering. Géricault died young, and of the other young men of the rising romantic generation, who included Paul Delaroche (1797–1855), Ary Scheffer (1795–1858), and Eugène Deveria (1805–65), the greatest (though he disowned the term romantic) was Eugène Delacroix (1788–1863). Delacroix was imbued not only with classical literature but with the works of Shakespeare and Dante, Walter Scott, and Byron, and took his subjects from these (*The Barque of Dante*, 1821; *The Shipwreck of Don Juan*, 1841), as well as from medieval and classical history (*The Entry of the Crusaders into Constantinople*, 1841; *The Justice of Trajan*, 1840), and from his own experience in North Africa (*The Women of Algiers*, 1831; *The Lion Hunt*, 1855). He was one of the last great artists to decorate large public buildings with important paintings (The Chamber of Deputies, the Luxembourg Palace Library, the Church of St-Sulpice). As a gentleman with high government connections who nevertheless despised the Academy (which long refused him membership because of the novelty and independence of his work), Delacroix was a kind of bridge between the older type of artist who served a patron and the modern artist whose independent creative spirit isolates him from society. For this reason as well as for his painterly style and his experiments in light and color, Delacroix was revered by succeeding generations of French artists. A remarkable writer, his *Journal* is a lucid and moving expression of wide-ranging artistic ideas and a valuable source for the cultural life of the period.

1830–60

TYPES OF REALISM. The mood of progressive mid-19th-cent. art focused in-

creasingly on the observation and description of external facts, both physical and social. One of the legacies of romanticism with its expansion of the possibilities of feeling was a greater awareness of the conditions of life of the humbler classes, and a sense that neither the formulas of classical nobility nor the newer conventions of romantic heroism and drama could adequately convey the truth of actuality. Honoré Daumier (1808–79) is noted for his sympathetic portrayal of the working people of Paris (*3rd-Class Carriage*, 1862, *The Laundress*, 1861) as well as for his many lithographs, published in the journals of the day, which satirized by sharp observation and caricature the foibles of the *bourgeoisie*. Jean François Millet (1816–75) was primarily concerned with the life of the peasant, and his *Sower*, 1850, and *Angelus*, 1859, though considered subversive at the time, have become probably the most widely known images of the 19th cent., so popular indeed that they have obscured knowledge of the rest of Millet's work. Official opposition was even fiercer in its hostility to Gustave Courbet (1819–77), who aggressively flaunted political and social views which after the Commune of 1871 forced him into exile, and encouraged him to paint with powerful detail and an shocking size the rough country people of the *Stonebreakers*, 1849, and *The Burial at Ornans*, 1851. Courbet painted many landscapes, often of dark, unpeopled forest interiors, but is best known for large figure compositions, of which the most ambitious is *The Painter's Studio*, 1855.

BARBIZON SCHOOL. Landscape realism was developed by the painters who came to be known as the Barbizon School because they often stayed in the little village of Barbizon in the Forest of Fontainebleau outside Paris. Here they worked directly from nature under the inspiration of 17th-cent. Dutch and more recent English landscape painting. Jean Baptiste Camille Corot (1796–1875) perfected his lucid style in trips to Rome and the northern French countryside and, though his reputation was based on studio-made Salon paintings, his most lasting works were *plein-air* landscapes

which created a convention of tonal harmonies and inspired many followers. The guiding spirit of the Barbizon group was Théodore Rousseau (1812-67), who, with a less classical, more northern feeling than Corot, typified in his paintings of various regions of France the movement away from the ideal landscape of Italy and toward the recording of particular motifs in the French countryside (*Village in Berry*, 1842, *Le Givre*, 1845, many paintings of Fontainebleau, Les Landes, the Auvergne, etc.). Other artists in this group were Charles Daubigny (1817-78), whose free touch earned him the kind of criticism later directed against the impressionists; Constant Troyon (1810-65), heavily influenced by the Dutch in his treatment of animals in their rural environment; Jules Dupré (1811-89); and Narcisse Virgile Diaz de la Peña (known as Diaz) (1808-76). All of the Barbizon painters were in varying degrees known to and admired by the generation that followed them, the impressionists. Two other painters, even more intimately associated with impressionism through their friendship with Monet, were Eugène Boudin (1824-98) and the Dutchman, Johann Barthold Jongkind (1819-91). Both of these men were noted particularly for their coastal scenes, in which low horizons, vast skies, and the flicker of light on water provided an opportunity for experiments with color as light.

ENGLAND. Outside of France the most notable type of realism was that of the Pre-Raphaelite painters in England. The young artists John Everett Millais (1829-98), William Holman Hunt (1827-1910), and Dante Gabriel Rossetti (1828-82) formed the Pre-Raphaelite Brotherhood in 1848, and for a few years thereafter produced pictures in which the intense rendering of detail was supported by a genuine moral conviction (Millais' *The Blind Girl*, 1856; Hunt's *The Awakening Conscience*, 1853). Their art greatly influenced later artists such as Ford Madox Brown (1821-93), and was defended by John Ruskin against accusations (by Charles Dickens and others) of crudeness and blasphemy.

LATER REALISM. The French artists were the pioneers of realism, which

spread rapidly throughout Europe. In its later phases the style tended toward the dry and the literal, and was always at its best in modest genre and landscape subjects. In France the academic realism of Meissonier (1815-91) and J. L. Gérôme (1824-1904) was the expression not of a deep personal vision but of the more trivial interests and fantasies of bourgeois society. The stronghold of such artists was the Salon, a large exhibition juried by members of the Académie des Beaux-Arts and held regularly in Paris. The Salon was taken by the public to be the arbiter of aesthetic taste and regularly refused to admit the most original works of the time.

1860-85

BEGINNING OF IMPRESSIONISM.

Although impressionism as a critical (in both senses) term was not officially coined until the 1870's, the group of extraordinarily gifted artists who were associated with the movement came into their maturity in the 1860's.

MANET. Édouard Manet (1832-83), a bourgeois and even a dandy, and trained in the studio of the academic Thomas Couture (1815-79), consistently submitted his work to the Salon, where it was frequently refused. In 1863 he and other rejected artists—Camille Pissarro (1830-1903), Armand Guillaumin (1841-1927), the American James Abbott McNeil Whistler (1834-1903), and Jongkind—exhibited their works separately at what was called the Salon des Refusés, where Manet's *Picnic on the Grass* caused a public sensation, although in its combination of nude women and clothed men it was following a long-established Renaissance tradition. Manet's *Olympia*, shown in the Salon of 1865, also aroused the public, who could not tolerate the novel, contemporary treatment of what had been established as an idealized theme, the reclining nude. Manet's realism was fresh and direct. He had a remarkable gift for creating convincing form with great economy of stroke, and his subjects—contemporary Parisians in contemporary dress—made him what the poet Baudelaire had called for in his critical

writing, the "painter of modern life" (*Concert at the Tuileries*, 1862; *Portrait of Zola*, 1868; *At the Café*, 1878; *The Bar at the Folies Bergère*, 1882).

DEGAS. His friend Edgar Degas (1834-1917), an admirer of Ingres and student of Renaissance painting who began his career by portraying traditional subjects (*The Young Spartans Exercising*, 1860; *Semiramis Founding a Town*, 1861), also developed into an acute observer of the contemporary scene in many penetrating portraits (*The Bellelli Family*, 1859) and in his paintings of the ballet, the race-course, the café, and women bathing (*The Dancing Class*, 1874, *The Absinthe Drinker*, 1876). Degas, influenced by the Japanese prints which 1st appeared in Paris in the 1850's, and by experiments in photography, developed a new sense of pattern in his compositions and an asymmetrical cutting off of figures which creates the impression of immediacy (*Place de la Concorde*, 1873; *The Millinery Shop*, 1886). Neither Manet nor Degas considered themselves impressionists. Manet, though friendly with the group, joined none of their 8 group exhibitions held in Paris between 1874 and 1886; Degas participated in 7 of these but held himself aloof from what he considered the radical nature of the group.

THE IMPRESSIONIST STYLE. The general characteristics of the impressionist style, all of which became fundamental sources of modern painting, were (1) a lightening of the palette far beyond anything previously known; (2) a concentration on the relationship of light and color, so that form is created by many individual touches of color and hence traditional solidity is dissolved, (3) an increasing interest in the 2-dimensional surface of the picture rather than the 3-dimensional penetration into depth; (4) an apparently casual, over-all "scatter" composition; and (5) a concern with the life of leisure and private experience, whether among strolling city crowds and country vacationers or in domestic interiors and gardens.

MONET AND Renoir. The most consistent and powerful of the impressionists was Claude Monet (1840-1926), whose *Impression—Sunrise* drew the con-

temptuous term "impressionist" at the 1st group exhibition in 1874. Monet worked in the 1860's and 1870's with Auguste Renoir (1841-1919), painting brilliant *plein-air* landscapes on the Normandy coast and in villages along the Seine outside Paris. They often employed the same motifs (*La Grenouillère*, 1869; *The Duck Pond*, 1873, *The Seine at Argenteuil*, 1874). As early as 1873 Monet built a studio on a boat at Argenteuil, and for the rest of his long life he never ceased to study the effects of light and atmosphere, often in series which rendered the changing colors of the different times of day (*Haystacks*, 1893, *Rouen Cathedral*, 1894). His crowning works were the great *Water Lilies* paintings, created (between the late 1890's and his death) in a specially constructed water garden at Giverny, where he had settled in 1883. Renoir also continued to paint landscape, but with less intensity, and was always more interested in figure painting (*The Moulin de la Galette*, 1876; *The Boating Party*, 1879), and increasingly devoted to women and children (*Mme. Charpentier and her daughters*, 1878) and bathers from the 1880's until the end of his life.

OTHER IMPRESSIONISTS. The most genial of the impressionists was Pissarro, who produced many canvases of scenes of Paris and the Île-de-France, which changed little except for a period in the late 1880's, when he was influenced by the ideas of Georges Seurat. Other painters in or associated with the impressionist group were Alfred Sisley (1839-99), Frédéric Bazille (1841-71), Berthe Morisot (1841-95), the American Mary Cassatt (1845-1926), Jean Louis Forain (1852-1931), and Félix Bracquemond (1845-1914).

1885-1905

POST-IMPRESSIONISM. The 1880's saw a reaction against impressionism and a desire, variously expressed, for an art that would be more structured, more austere, less sensuous, and more spiritual. The belief that impressionism, with its interest in light and air, was an art of naturalism formed part of one of the most important processes of the modern revo-

lution in art: the divorce of the painting from nature, the destruction of the idea of the "mirror of nature," the assertion of the autonomy of a work of art.

POINTILLISM. Georges Seurat (1859–91), fascinated by the scientific color theories of Chevreul and Rood, systematized the loose, varied, commalike strokes of the impressionists into a pattern of uniform, calculated spots of color with which he built up a relatively flat, highly simplified, and carefully composed pattern of shapes (*La Grande Jatte*, 1886, *Les Poseuses*, 1888, *Le Cirque*, 1890). Known as pointillism—though Seurat preferred the term divisionism—the style attracted many followers, who tended to apply Seurat's original method rather mechanically and without his compositional structure. Seurat's imitators included Paul Signac (1863–1935), Maximilien Luce (1858–1941), Henri Édouard Cross (1856–1910), and the Dutchmen Théo van Rysselberghe (1862–1926) and Henry van de Velde (1863–1957).

CÉZANNE. The greatest of the forerunners of modern painting was Paul Cézanne (1839–1906), who, after 1st working in a very intense romantic vein (*The Temptation of St. Anthony*, 1868), disciplined himself through impressionism and went on to develop an art in which strong feeling is controlled by form. He made of the impressionist brush stroke a sensitive, vibrant plane of pure color, with which he built structures at once solid and luminous. After the death of his disapproving father in 1886, he was able to work steadily in his native Provence, where he made many landscapes of the region, still lifes, and figure paintings. These works, with their visible structure of overlapping planes, express a new sense of what a painting is: not a finished product in which the artist's effort is concealed, but a dynamic object which conveys the experience of the artist responding and deciding. This structure and this dimension of time were later of great significance for the cubists.

VAN GOGH. For Vincent Van Gogh (1853–90) impressionism was not a discipline but a release, freeing him from his

early dark Dutch palette (*The Potato Eaters*, 1885), but not taking him far enough for a man of his intense spiritual ardor. At Arles in the south of France he found the brilliant light he needed and, for a time, the hoped-for simplicity of man and nature. In the 2½ yrs. before his death by suicide he produced an extraordinary body of work marked by brilliant color, rich pigment laid on rapidly in swirling brush strokes, and powerful distortions of form (*L'Arlésienne*, 1886; *Cypresses*, 1889; *Crows over a Wheatfield*, 1890). Unknown in his lifetime—Van Gogh remains the archetype of the great but neglected artist—his work exerted a strong influence on later expressionist artists. Two other northern artists of the same generation, the Belgian James Ensor (1860–1949, *Entry of Christ into Brussels*, 1888) and the Norwegian Edvard Munch (1863–1944, *The Cry*, 1893), also created powerfully emotional images through exaggeration and distortion of form.

GAUGUIN. Paul Gauguin (1848–1903), like Van Gogh, despised Parisian sophistication—indeed, social convention of almost any kind—and sought simplicity, 1st at Pont-Aven in Brittany, later for a short disastrous period in Arles with Van Gogh, and finally, from 1891 until his death, in Tahiti. The strength and range of Gauguin's revolt against western society and art has been enormously influential. His life—beginning as a conventional stockbroker and Sunday painter, abandoning income and family for art, and finally leaving Europe entirely to seek the freedom of a primitive land—is a modern paradigm, and his art has given birth to many forms of antinaturalism. Gauguin's development out of impressionism was toward an increasing flattening of the picture surface, composing with strongly outlined shapes in brilliant colors, with a minimum of 3-dimensional modeling. His emphasis on the expression of feeling or idea rather than representation of nature allied him with the literary movement of symbolism, though he and his collaborator Émile Bernard used the term syncretism. Both in his actions and in his art Gauguin reached out toward cultures which had long been ignored as alien or

crude—Romanesque Europe, the Near and Far East—and which have ever since his time exerted a strong influence on western art. Artists associated with and directly influenced by Gauguin were the Nabis, active in the 1890's: Maurice Denis (1870–1945), Pierre Bonnard (1867–1947), Édouard Vuillard (1868–1940), and the sculptor Aristide Maillol (1861–1944). Bonnard and Vuillard later developed their own personal styles of post-impressionist depiction of private, domestic interiors, known as intimism.

OTHER LATE-19TH-CENTURY PAINTERS. Other artists active at this time and associated with the antinaturalistic movement were Henri de Toulouse-Lautrec (1864–1901), whose combination of sharp observation and flat patterns revolutionized the art of the poster; Odilon Redon (1840–1916), who painted the imagery of dreams; Henri Rousseau (1844–1910), called "le Douanier" and the father of modern primitivism in painting; the Swiss Ferdinand Hodler (1853–1918); and the Viennese Gustave Klimt (1862–1918).

ART NOUVEAU. Much of the painting of the 1890's and particularly the work of Gauguin, is characterized by a highly developed surface pattern, often with curved and twisting shapes. This strong emphasis on the long, sinuous curve, the curve of a stem or a flame, was the basis of an extremely unified style, known variously as Art Nouveau, Jugendstil, and Style Moderne, which appeared all over Europe at the end of the 19th cent. Appearing perhaps earliest in England (Arthur Mackmurdo [1851–1942]; title page of Wren's *City Churches*, 1883) as a development of the Arts and Crafts movement, it soon went well beyond that movement's serious social aims in the art of Aubrey Beardsley (1872–98), whose extraordinary illustrations for *Siegfried*, *Salomé*, and *Lysistrata* exploit the possibilities of the long curve, the arabesque, and the pattern of black and white to a point at the extreme edge of refinement. A contemporary Dutch artist, Jan Toorop (1858–1928), had something of Beardsley's feeling for curving, attenu-

ated, neurasthenic figures (*The Three Brides*, 1893).

Art Nouveau, resulting primarily from a revival of the craft of design, is found most of all in the decorative arts and in architecture. The poster, revived by Lautrec and the Nabis, became a universal expression of the style, whether or not designed by a well-known painter. New magazines—*Studio*, *Jugend*, *Simplizismus*, *L'Art Décoratif*, *The New Art Club*, *Sesezion*, *Les Vingt*—spring up and made use of the new style in illustration and typography. Émile Gallé (1816–1901) in France and Louis Comfort Tiffany (1848–1933) in America made glass vessels and lamps which often took the actual form of growing plants. In Belgium, one of the earliest architectural sources of the style was Baron Victor Horta's (1861–1947) house at 6 Rue Paul-Émile Janson in Brussels, where every element, iron stair railings, molding, floor patterns, is in the form of flowing tendrils. Perhaps the best-known examples of Art Nouveau are Hector Guimard's (1867–1912) stations of the Paris Métro, dating from 1900. Its most extraordinary manifestation is in the architecture of Antonio Gaudí (1852–1926) in Barcelona: *Sagrada Família*, 1903–26; *Casa Batlló*, 1905–7; *Casa Milà*, 1905–7, with their elaborately worked surfaces, their sudden shifts of proportion, and their obsession—e.g., the undulating façade of the *Casa Milà*—with the curved line.

1905–45

THE NATURE OF 20TH-CENT.

ART. Almost the only accurate generalization that can be made about 20th-cent. art is that it possesses no single, unified tendency. There are, however, dominant forces, and it is these which will ultimately characterize the period in historical perspective. Schools and movements multiply in this century, but there are certain fundamental elements: (1) a sharp reaction against the classical tradition of the West, and a ready acceptance of influences from the arts of Africa, India, Persia, the Pacific Islands—all the

- earlier arts in which realism is subordinate to expressive form; (2) a profound sense of the dimension of time: the role of speed, the rapidity of change, the relativity of point of view; (3) the notion of object-as-energy: things are no longer seen as solid impregnable surfaces but as microcosms of invisible universal energy, hence unstable and built of forms entirely new, having nothing to do with their visible surfaces; (4) the increasing significance of color, which ceases to be an attribute of things and becomes an independent substance with attributes and implications of its own; (5) the idea that the unconscious, both personal and collective, has a greater force than the rational will, hence the significance of unconscious imagery, spontaneous gesture, and chance; and (6) in the nonwestern world the universal influence of styles developed in the West, particularly the styles of abstraction which liberate the artist from local tradition and imagery.

EXPRESSIONISM. With roots in the work of Van Gogh, Munch, Ensor, and Klimt, expressionism as a movement emerged in Germany with the founding in 1905 of the group of artists called "Die Brücke": Ernst-Ludwig Kirchner (1880-1933), Erich Heckel (b. 1883), and Karl Schmidt-Rutloff (b. 1884). These artists, joined in 1906 by Emil Nolde (1867-1956) and Max Pechstein (1881-1955), looked for inspiration to the harshness of northern medieval art and to primitive African art, which now for the 1st time was looked at aesthetically. They were possessed by a strong social and religious antagonism against bourgeois society, and their subjects were often drawn from the lower depths and were expressed with brilliant acid color and violent, angular shapes. They particularly developed the art of the woodcut, creating simple, angular forms suited to the cutting medium. Other German and Austrian artists who worked in an expressionist style were Egon Schiele (1890-1918), Oskar Kokoschka (1886-1966), George Grosz (1893-1959), and Max Beckmann (1884-1950). The latter 2 in particular, with their savage imagery of German life between the wars, exemplified the characteristic expressionist content of moral concern

and fierce social criticism. Another significant European expressionist was the Polish Chaim Soutine (1894-1943), who, like so many artists at this time, was an *émigré* in Paris and whose imagery was largely French—still life, landscape, figure—but whose tensions and agonies were expressed in thick, swirling impasto and dislocations of form. Later important examples of expressionism on a large public scale were the murals done in Mexico and the U.S. by the Mexican painters José Orozco (1883-1919) and Diego Rivera (1886-1957), both of whom were deeply concerned with the social and political content of their work.

FAUVISM. The members of Die Brücke were much influenced by the work of a group of French painters who in 1905, when a number of them showed together for the 1st time in the Salon d'Automne in Paris, were dubbed "Les Fauves" or "The Wild Beasts": Henri Matisse (1869-1954), Georges Rouault (1871-1958), André Derain (1880-1954), Raoul Dufy (1877-1953), Maurice Vlaminck (1876-1958), Albert Marquet (1875-1947). With the exception of Rouault, who went on to create a Christian imagery involving prostitutes, evil judges, and the Man of Sorrows, these artists were far less concerned with social problems than were their German contemporaries. Their main objective was to develop the implications of the art of Seurat, Van Gogh, and Gauguin by the use of strokes of brilliant arbitrary color, often so separated as to leave empty canvas between, and highly simplified shapes, composed in a strong surface pattern. Fauvism as a movement was short-lived but, particularly in its use of color, it had a permanent effect on modern painting. It was Matisse who most consistently worked with the Fauve principles of color throughout his life. His late works were composed of organic shapes cut from papers which he had himself painted in brilliant saturated colors.

CUBISM. Cubism was probably the single most fruitful movement of the century, affecting as it did the development not only of painting but of sculpture and architecture as well. Both the

form and the content of cubism were implicit in the late work of Cézanne, and the movement took root all over Europe at roughly the same time, wherever the new currents of thought were fertilized by knowledge of Cézanne's work. It was Pablo Picasso (b. 1881) and Georges Braque (1882-1963), however, who first seriously worked out the appropriate implications and gave form to the cubist vision. Picasso's *Demoiselles d'Avignon*, 1907-8, was the first major work in which solid form is broken into planes, in this case harsh and angular as though wrenched from stability. In the following year Braque and Picasso became close friends, and began to make paintings which were deliberately indistinguishable in their earth colors and their increasingly more complex network of interpenetrating planes. By 1912, they were composing pictures entirely with superimposed flat shapes, a structure emphasized by the invention of the collage, in which some of the shapes are actual pieces of newspaper, concert tickets, or printed wallpaper. This final destruction of traditional pictorial depth was fundamental to all future painting, and the collage became a new independent medium, widely practiced in the 1920's by the Dada group, in particular by the German Kurt Schwitters (1887-1948), and most recently giving birth to the contemporary form of the assemblage, in which collage moves from the realm of painting into that of sculpture. Picasso and Braque grew apart after 1914. Braque went on to make out of the cubist spatial structure a perfect medium for still-life painting, while Picasso used it for essentially expressionist purposes, as in his *Guernica* of 1937.

Among the Parisian contemporaries of Picasso and Braque were many artists who around 1910 began to experiment with cubist forms. These were the men who showed in the Salons and attracted critical attention and the term "cubism" to their work. (By this time in Paris independent Salons in which all artists were free to show their work had existed for 25 years. However, Picasso never showed there, but made his work known to buyers through the great dealer Daniel

Henri Kahnweiler. In this he again foreshadowed the future: after World War I the Salons declined in importance, and the present system of exhibitions held at dealers' galleries, publicized in the press and by critics, was fully established.) Albert Gleizes (1881-1953) and Jean Metzinger (1883-1956) were the theorists of the movement, interested, as was Jacques Villon (1875-1963), the leader of their group, in the simultaneity of vision in cubism—the seeing of all aspects of an object at once by the breaking of it up into shifting planes. Robert Delaunay (1885-1911), noted for his *Eiffel Tower* series, moved close to abstraction in his *Simultaneous Disks* of 1912; Fernand Léger (1881-1955) expressed a new enthusiasm for industrial life by constructing figures out of cylindrical, machinelike forms. Marc Chagall (b. 1887), a Russian fantasist, adapted the structures of cubism to his own expressive dislocations; and Marcel Duchamp's (b. 1887) *Nude Descending a Staircase* was one of the sensations of the Armory Show of 1913, which first brought to the U.S. the work of the European moderns. Other important cubists were Juan Gris (1887-1927) and Francis Picabia (1879-1953).

FUTURISM. An Italian movement, futurism was affiliated with cubism, both because its progenitors, Filippo Marinetti (1876-1944) and Gino Severini (1883-1966), were friends of the Parisian circle of cubists and because they used the style to express their progressive sense of time and motion. Other futurists were Giacomo Balla (1871-1958) and the sculptor Umberto Boccioni (1882-1916).

DER BLAUE REITER. Der Blaue Reiter (The Blue Rider), a group formed in 1911 in Munich by Wassily Kandinsky (1866-1944) and Franz Marc (1880-1916) and later joined by Paul Klee (1879-1940) was the center of the cubist style in Germany, most particularly in the work of Marc, who was killed in the War, and Klee, who made out of cubist structure his own cryptic, miniature style.

ABSTRACT PAINTING. Pure abstraction was the last of the modern movements not to receive its main impulse from Paris, though Delaunay and the expatriate Czech Franz Kupka (1871-

1957; *Disks*, 1912) contributed to its origin. The 2 major theorists and practitioners of abstraction were Wassily Kandinsky in Munich and Piet Mondrian (1872-1944) in Holland. Each arrived at abstraction around 1911 by a very different development and with very different results. Their work represents the 2 historic poles of abstract painting: the organic and the geometrical, the expressionist and the restrained, the romantic and the classic. Kandinsky's color abstractions, the 1st of which was perhaps done in water color, developed out of a richly colorful style that had been strongly influenced by the Fauves. They were composed of a variety of loose strokes and touches, all held together by color, tone, and movement. In 1912 Kandinsky's book, *Concerning the Spiritual in Art*, expounded his theories of the metaphysical meaning of color harmonies. Mondrian, on the other hand, coming out of Dutch realism and Art Nouveau, was greatly affected by cubism, and in a series of *Trees*, 1909-11, he moved from delicate realism through increasing linearity to a basic "plus-minus" pattern—gridlike, but so sensitively composed that it is never mechanical. With Theo van Doesburg (1883-1931) he founded in 1917 *De Stijl*, a revolutionary review of the arts which particularly attracted architects like J. J. P. Oud (1890-1963) and G. T. Rietveld (1888-1964), and whose name became attached to the severely rectilinear style of Mondrian and his followers, also called "neoplasticism." Mondrian had a monklike austerity and a belief in the value of utter purity, which led him to limit himself to the 3 primary colors, plus black and white, and to employ only right-angle forms. In 1940 he came to New York, where he experimented with smaller color areas, juxtaposed so as to create optical movement (*Broadway Boogie Woogie*), and where his personality and art influenced young painters such as Robert Motherwell (b. 1915).

Kandinsky's own spontaneous style became more schematic and geometrized when he went in the 1920's to teach at the Bauhaus, the great German school of

design founded by Walter Gropius in 1919 and later closed by Hitler. There the most powerful influences were the ideas of neoplasticism and the Russian constructivist, Kasimir Malevich (1878-1935). Three of the major figures at the Bauhaus—Lyonel Feininger (1871-1956), László Moholy-Nagy (1895-1946), and Josef Albers (b. 1888)—all came in the 1930's to the U.S., where the latter 2 helped to revolutionize the teaching of art and design. Although Kandinsky never went to the U.S., his works were collected by the Guggenheim family and exhibited in New York in the 1940's, where they influenced a new generation of artists. Another influence was the teaching of the German artist Hans Hofmann (1880-1966), who taught in the U.S. from 1932, and whose work from 1940 on represented an effort at synthesis of the 2 poles of abstraction.

DADA AND SURREALISM. In 1916 a group of artists in Zurich taking refuge from the war—Jean Arp (1887-1966) and the poets Tristan Tzara and Richard Huelsenbeck—picked for themselves the nonsense word "Dada" to express their feeling that all traditional seriousness about high art was foolish. Picabia, Duchamp, and Max Ernst (b. 1891) later joined the group in Paris, and exhibitions were held in which the aim was to shock the beholder by displaying ordinary objects, such as urinals, and extraordinary objects, such as a mustachioed Mona Lisa, with all the solemnity of a work of art. The point was not to confer serious meaning on the objects so much as to satirize and destroy the notion of serious meaning in art as it had traditionally existed. Visitors were also assaulted by sudden blackouts, nonsense readings, and false disasters. In all these attitudes and actions the Dada group proved to be what they would certainly have disowned at the time—the founders of a tradition, now very active in the current international "scene" of Pop art and Happenings.

Surrealism, a term coined by the poet-critic Guillaume Apollinaire (1880-1918) in 1917, was developed in the 1920's in Paris by some of the Dada artists, to-

gether with André Masson (1896–1967), Joan Miró (b. 1893), Salvador Dalí (b. 1901), Yves Tanguy (1900–1955), Giorgio de Chirico (b. 1888), and the French poets Louis Aragon, André Breton, and Paul Éluard. Philosophically the movement drew on Freudian ideas of the unconscious, pictorially it represented a reaction against the discipline of cubism and geometric art. One aspect of surrealism, exemplified by Dalí, is the highly realistic rendering of impossible objects, or ordinary objects in extraordinary relations. This kind of surrealism continued to be practiced by the Belgian artists René Magritte (1898–1967) and Paul Delvaux (b. 1897). Another and more fruitful development was the invention of abstract organic forms, as in the work of Miró and Arp. Masson and Ernst contributed the influential idea of "automatic writing" (or drawing) as a significant record of spontaneous, subconscious gesture. Both Masson and Ernst lived in New York during World War II (Dalí and Tanguy were also there, and Duchamp had lived in New York since 1920) and established important contacts with younger American artists, some of whom, like Arshile Gorky (1904–48) and William de Kooning (b. 1904), had themselves emigrated from Europe as young men.

1945–68

ABSTRACT EXPRESSIONISM. With the appearance of a group of artists known as the "New York School"—Mark Rothko (b. 1903), de Kooning, Franz Kline (1910–1962), Motherwell, Barnett Newman (b. 1905), Adolph Gottlieb (b. 1903), William Bazotes (1912–1966), Jackson Pollock (1912–1956)—American artists became for the 1st time full participants in the international artistic world. The U.S. had always, since John Singleton Copley (1738–1815), had a powerful tradition of realism, ranging from the mid-19th-cent. landscape and genre painters through Winslow Homer (1836–1910), Thomas Eakins (1844–1916), and Edward Hopper (1882–1967), but its role in relation to the

European discoveries since impressionism had been largely that of pupil and assimilator. Many things contributed to the change, the most immediate being direct personal contact for American artists with European modernists who expatriated themselves during World War II. What took place in the U.S. was a leap into abstraction that had the character of the Kierkegaardian leap of faith, full of exaltation and anxiety and of a strength sufficient to make itself felt during the postwar years as a genuinely new movement.

The work of Pollock, de Kooning, and Kline introduced a new conception of the canvas as an over-all field of force in which the drama of painting itself is enacted, and in which personal gesture is of primary significance. Rothko, Newman, and Gottlieb, working like the others on a new large scale, concentrated on the massive, single, contemplative image in which experimental color relationships play a major role. Postwar European abstraction developed along similar lines in the work of Pierre Soulages (b. 1919), Nicolas de Stael (1914–55), Hans Hartung (b. 1904), and others, but for the 1st time in interaction with American work rather than as inventor and master, and in countries outside France the impact of New York was often greater than that of Paris.

The various styles of abstraction, though personal and hence individually different, became in the aggregate a new international style, spreading rapidly due to the new mobility of travel, the ease of reproduction, and the growth of international loan exhibitions. Artists in Eastern Europe, particularly in Poland and Yugoslavia, were deeply influenced by the new abstraction as they tried to break away from the prescribed socialist realism which had been the official Soviet style since the early 1920's. At that time, after approving an initial burst of modernism connected with the Revolution, the Soviet government had reversed its position and suppressed the modern movement, causing the exile of such major figures as Kandinsky, Malevich, Pevsner, and Chagall. Abstract painting, which does in fact

give visual expression to the modern sense of personal, emotional, and imaginative freedom and thus carries some of the most advanced values of individualistic western civilization, continues to be resisted by official Communist culture, which asserts the supremacy of social over individual values. (Ironically, conventional opinion in the West, particularly in the U.S., has often regarded abstract art as dangerously "socialistic," imaginative freedom here being linked with anarchy and the destruction of traditional community values.) The new international style was also the model for artists outside the European tradition, whose struggle was not political but rather cultural, since they had to assimilate modernism to centuries-old traditional patterns. The results have of necessity been more imitative than inventive, but such figures as Japan's Zao-wou-ki (b. 1920) and Kenzo Okada (b. 1902) represent original contributions to modern painting.

The later 1950's saw a reaction against the dramatic, emotional content of abstract expressionism and toward a greater impersonality and objectivity in works of art. One aspect of this reaction, to be seen in the work of Robert Rauschenberg (b. 1925) and Jasper Johns (b. 1930), was the conferring of a new kind of aesthetic status on such common objects as mattresses and beer cans. This innovation was followed by the introduction of a whole range of themes derived from popular, commercial imagery by a group that came to be known as the "Pop" artists. Another trend was the development of hard-edge, or "post-painterly," abstraction by such figures as Ellsworth Kelly (b. 1923), Kenneth Noland (b. 1924), and Frank Stella (b. 1936), who use the traditional materials of paint and canvas but often combine modular units in constructivist fashion to create complex patterns of line, color, and shape. Their experiments in color relations link them to such older European figures as Victor Vasarely (b. 1908) and the Groupe de Recherche Visuel (founded in Paris in 1960), who work with the physical properties of light and color to create the optical illusion of

actual movement on a surface. One of the convictions held by these artists is the importance of anonymity and impersonality. They also feel the need to relate their work to the discoveries of science.

SCULPTURE

1800-1910

NEOCLASSICAL SCULPTURE. In the 1st half of the 19th cent. sculpture was largely dominated by neoclassical style and subject matter. The two neoclassical masters, the Dane Bertel Thorvaldsen (1768-1844) and the Italian Antonio Canova (1757-1822), set a pattern which went unchallenged and continued to be practiced throughout the century by such men as James Pradier (1792-1852; *Atalanta at Her Toilet*, 1830) and Giovanni Dupré (1817-82; *Sappho*, 1857). The most characteristic sculptural expression of the period was the monument, usually publicly commissioned to honor a national hero. Numerous 19th-cent. monuments of this kind remain, but for the most part their creators have been forgotten. Among the most famous is the Arc de Triomphe, on which the central relief group, *Departure of the Volunteers*, 1836, by François Rudé (1784-1855), is a fine example of dramatic romantic expression in neoclassical form. The monumental tradition was carried on to the end of the century in such works as the Statue of Liberty, 1886, by Frédéric Auguste Bartholdi (1834-1904) and the *Adams Memorial*, 1891, by the American Augustus Saint-Gaudens (1848-1907).

On a smaller, more private scale were the portrait busts of David d'Angers (1788-1856) and the animal sculptures of Antoine Louis Barye (1795-1875). The most expressive sculpture of the midcentury was done by Daumier, who made many studies of figures and heads which he considered only as personal sketches and of which few have been preserved. Degas, too, made powerful little wax studies of dancers which he cast in bronze but did not exhibit. A gentle genre realism was practiced by Jules Dalou (1838-1902), while the Belgian,

Constantin Meunier (1831-1905), taking up sculpture after a career in painting, continued to create heroic images of the working man (*The Puddler*). Jean Baptiste Carpeaux (1827-75) produced classical sculpture, but with a new feeling of directness and realism, his stone group, *The Dance*, done for the Paris Opera House, 1865-69, had the compliment paid to it of a bottle of ink thrown at one of the nude figures, which were felt to be obscene not because of their nudity but because of their expressiveness.

RODIN. By far the greatest sculptor of the 19th cent. was Auguste Rodin (1840-1917). Formed essentially by a study of Michelangelo and by painstaking observation of nude models in movement and in repose, Rodin produced sculpture which in its monumentality climaxed the Renaissance figural tradition, in its dramatic realism expressed the 19th cent., and in its innovations foreshadowed the 20th. On the appearance of his 1st major piece *The Age of Bronze*, 1877, Rodin was accused of having achieved such convincing realism by making a cast of a live young man, later objections were raised to the expressive realism of his *Burghers of Calais*, 1884-86, and to the insufficient dignity of his *Balzac*, 1891-98. In *Man Walking*, 1888, and other figures he used anatomical fragmentation as an expressive means, and the surface of his bronzes retains the rough marks of the sculptor's touch in clay.

1910-68

CUBISM AND CONSTRUCTIVISM. Sculpture in the 20th cent. has had a development more closely related to painting than at any time during the preceding century. Leaving public commissions to the academic realist, modern independent sculptors have participated to the full in the visual revolution, i.e., in the denial of naturalism and the invention of new forms based on a new view of reality.

Much of modern sculpture has grown from the cubist vision, Picasso himself in his *Head* of 1910 having created volume out of angled planes. In Raymond Du-

champ-Villon's (1876-1918) *The Horse*, 1914, form is entirely broken up and reconstituted into separate elements, which combine to express the movement rather than the surface appearance of the animal. This destruction of solid 3-dimensional form and reconstruction into multidimensional form was also accomplished in the years before World War I in the work of Alexander Archipenko (1887-1964), Henri Laurens (1885-1954), and Jacques Lipchitz (b. 1891). Their productions were created by a new method, by means of which a piece of sculpture was constructed out of separate pieces of material. Previously, the 2 traditional ways of making sculpture had been either to cut away from solid material or to mold the object, using a plastic material. The new method was 1st definitively followed by the Russian constructivists Vladimir Tatlin (b. 1885) and the brothers Naum Gabo (b. 1890) and Antoine Pevsner (b. 1886), all of whom were greatly influenced by cubism and by collage, itself a constructivist medium. Gabo's *Head*, 1910, is constructed of sheets of iron bent and folded like paper so that the hollows of space are an intrinsic part of the structure. Gabo and Pevsner soon made completely abstract forms out of such new materials, as plastic, steel, and nylon thread, with such titles as *Translucent Variation on a Spheric Theme* (Gabo, 1937). Other notable constructivist sculptors are Julio Gonzales (1876-1942), David Smith (1906-65), and Richard Lippold (b. 1915).

KINETIC SCULPTURE. Important contemporary developments resulting from the constructivist revolution include "kinetic" sculpture. Alexander Calder (b. 1898) began making wire "drawings in space" and in the early 1930's constructed the 1st mobile: a structure of flat iron shapes and wires so composed and balanced that it moves with air currents. Nicolas Schoffer (b. 1912) introduced the electric motor as the source of movement along with light, color, and sound in a kind of grand synthesis of the arts. Jean Tinguely (b. 1925) went beyond Calder's playful humor in his sardonic "meta-

machines" which are intended to destroy themselves as they operate. The use of electronics for both movement and light has become an important area of investigation in kinetic sculpture today.

FOUND OBJECTS AND JUNK SCULPTURE. Probably the earliest *objet trouvé* in sculpture was the metal cheese-server in Picasso's *Glass of Absinthe*, 1912. The Dada artists originated the phrase, though their interest was in the nature of the object itself rather than in its transformation into part of a constructed sculpture. Picasso's *Goat*, 1950, is an example of the latter—a bronze casting of a lifelike animal figure constructed out of bicycle parts, toy cars, and other bits of junk. Eduardo Paolozzi (b. 1924) and Richard Stankiewicz (b. 1924) are 2 major figures whose sculpture is made in this way. Louise Nevelson (b. 1900) does not cast but builds directly with an enormous variety of objects, constructing huge boxlike reliefs encased in wood, which approach the quality of a total environment.

ORGANIC SCULPTURE. Another trend in 20th-cent. sculpture was the concern not so much with space, movement, and mechanics as with the simplification of volume so as to bring sculptured forms closer to the basic forms and rhythms of nature. Biology rather than physics has been its inspiration. Constantin Brancusi (1876–1957), a Hungarian who worked in Paris from 1904, was influenced by cubist planarity but even more by archaic Mediterranean sculpture and his feeling for such natural phenomena as the egg and the water-polished stone. He advanced from his simplified heads of 1910–20 to the more completely abstract forms of the *Fish*, 1928, and *Bird in Space*, 1940. Amadeo Modigliani's (1884–1920) painting as well as his sculpture was influenced by Brancusi, whose close friend he was. Jean Arp (1888–1966) worked his way from organic shapes in cut paper and in relief toward sculpture in the round, the latter purely abstract, but with the smooth, irregular curving shapes of a snowdrift, a sleeping cat, or a nude woman. In England, sculpture was revitalized by Henry Moore (b. 1898), who like Brancusi has

always used the traditional media of wood, stone, and bronze. He has progressed from purely formal organic shapes to an increasing interest in the human figure, which he has interpreted in terms of the natural rhythms of solid and void, convex and concave. His monumental reclining figures, made for an outdoor setting, take on the character of Mother Earth herself. Barbara Hepworth (b. 1903) makes abstract forms of wood and stone which express the movements of nature. In the postwar period Seymour Lipton (b. 1903) and Isamu Noguchi (b. 1904) have worked primarily in the organic mode.

EXPRESSIONIST SCULPTURE. Expressionist sculptors tend to be concerned with the human figure, distorted for emotional effect and spiritual meaning. Wilhelm Lembrück's (1881–1919) *Standing Youth*, 1913, uses elongation to express pathos and vulnerability. Alberto Giacometti's (1906–1966) bronze figures are reduced to the dimensions of a structure of nerves, while Germaine Richier (1904–1959) created the effect of the tearing apart of nerves and flesh. A very different kind of expressionism is found in the later works of Jacques Lipschitz, such as the *Minotaur*, where human and animal forces are expressed in heavy, curving, twisting shapes.

RECENT TRENDS. "Pop" sculpture is a reprise of Dada wit with a distinctly American flavor. It is characterized by a fusion of sculpture and painting (Jim Dine, Marisol) and by a desire to make of sculpture not a single object but a total environment (George Segal). In "minimal" sculpture, where the work is composed of flat, geometrical, or bulging organic forms, the impulse is essentially constructivist, both in technique and in the desire for impersonality. The Englishman Anthony Caro (b. 1924) has been an important originator in this mode.

ARCHITECTURE AND DESIGN

1800–99

19TH-CENT. REVIVALISM. 19th-cent. architecture was characterized by a series of revival styles: primarily neoclassical

and pure Gothic in the 1st half of the century, and picturesque and eclectic mixtures of Neo-Renaissance and neo-baroque in the 2nd half. Some magnificent monuments have resulted. Charles Barry's Houses of Parliament in London, the Paris of Napoleon III, and the great museums and opera houses of Europe, as well as many buildings whose high degree of decorative articulation has come to be appreciated anew in modern times. For the progressive minds of the later 19th cent., however, such historicism became increasingly intolerable. The ardent Gothicism, Augustus Welby Northmore Pugin (1812-52), believed that architecture expressed the character of an age, and that the virtue of medieval society could be deduced from the beauty of its buildings; he concluded that the building of Gothic was essential for the spiritual health of modern society, which with the advent of industrialism had become mean-spirited and ugly. The creators of modern architecture agreed with his premise, but repudiated his conclusion; for them, only that society could be healthy which developed its own style out of its own conditions, materials, and aspirations. The desire to formulate a distinctive modern style of architecture resulted from a growing awareness of modernity shared by all the arts.

ARTS AND CRAFTS MOVEMENT. 19th-cent. sources of modern design were in their time completely unrelated and even antithetical: the English Arts and Crafts movement and the iron and steel constructions of the engineers. William Morris (1834-96), trained as an architect and painter and repelled by the cheap, ornate, inorganic quality of the textiles, utensils, and furniture produced by the factories of the 1850's, made the crucial decision to become, not a painter withdrawn from the crass world, but a designer and head of a firm of designers who would devote themselves to making objects of solid craftsmanship and honest design. Morris' medievalism and particularly his rejection of the machine put him at odds with his own theory of art for the people, but his stubborn belief that present-day society should produce valid design and his establishment of the dig-

nity of craftsmanship were very important to the following continental generation. With his architect friend Philip Webb (1831-1915) he designed his own home, The Red House, in 1859, also a model for the European modernists in its simple, undecorated forms and in the fact that conscious craftsmanship was applied to every detail of a middle-class home.

ENGINEERING STRUCTURES: IRON AND STEEL. At a time when architecture was defined as the ornamental part of a building, the new demands of industrial life were giving birth to purely functional structures, such as bridges and railway stations, in which the physical requirements and the nature of the materials determined the form of the structure. An impressive early example was the Clifton Suspension Bridge of 1836 by I. K. Brunel (1806-59), with its simple, sweeping curve and total lack of adornment. The same architect, with Sir M. D. Wyatt (1820-77), built Paddington Station in London, 1852-54, where glass supported by slender iron columns and ribs served to enclose the large space of the train shed. Joseph Paxton's (1801-65) Crystal Palace, built to house the 1st international exhibition (London, 1851), was a prophetic structure of prefabricated iron and glass parts, spanning an unprecedentedly enormous space. The skeletal structure and consequent lightness resulting from the load bearing powers of the slender iron shafts and large quantities of non-load bearing glass looked forward to one of the most characteristic forms of the 20th cent., the curtain wall. Probably the best-known 19th cent. iron structure, also built for an international exhibition (Paris, 1889), is the Eiffel Tower. Designed by the French engineer Gustave Eiffel (1832-1923) as an open-work structure of small iron and steel beams, its upward thrust and sense of release from earth were very appealing to the constructivists.

THE SKYSCRAPER AND THE CHICAGO SCHOOL. Developments in steel manufacture by 1890 made possible the skeletal construction of the skyscraper, which was for a long time a primarily American phenomenon. Louis Sullivan's (1856-1924) Wainwright Building in St.

Louis, 1890-91, was the 1st in which the uniform gridlike appearance reveals the structure (despite the ornament and the top cornice, which are reminiscent of traditional masonry buildings). Other important industrial buildings in Chicago were the Marshall Field Wholesale Building of 1885, built by Henry Hobson Richardson (1838-86), a pioneer in the use of large, simple masses and an important influence on Sullivan; and Burnham and Root's Monadnock Block of 1890-91. Frank Lloyd Wright (1869-1959) was also associated with the Chicago school through his early studies with Sullivan, though his major contribution has been in the field of organic domestic architecture (Ross House, 1902; Bear Run, 1936).

Apart from steel, the most important modern material developed in the 19th cent., but not widely exploited until the 20th, was reinforced concrete, an aggregate which combines the compression strength of concrete and the tensile strength of steel. The French architect Auguste Perret (1874-1954) was the 1st to develop fully the possibilities of this new material (flats at 25 bis Rue Franklin, Paris, 1902-3; Notre-Dame du Raincy, Paris, 1922-23), which was further developed by his Swiss-born student Le Corbusier (Charles Édouard Jeanneret, 1887-1965) and the Italian engineer-architect Pier Luigi Nervi (b. 1891).

1900-68

EARLY MODERNISM. Apart from Perret, the major French contributor to early modernism was Tony Garnier (1869-1948), whose plans for an Industrial City were made as early as 1901, exhibited in 1904, and published in 1918. Garnier, with his statement that "in architecture, truth is the result of calculations made to satisfy known necessities with known materials," clearly states the case not only against Beaux-Arts academicism but against all historical architecture which embodies "false principles"—i.e., considerations other than the purely functional. This extreme position has never been consistently followed by modern architects, but it implies an attitude toward the past which the architects, like

the painters, required in order to achieve their revolutionary changes. Garnier's designs were extraordinarily advanced in their conception of town planning, in their technical inventions (e.g., the cantilever principle), and in the flat, clear, uncluttered lines of the buildings.

British and Austrian architects were pioneers in the development of the new modern style which, in the effort to cast away the habits of eclecticism, strove toward simplicity of form and, where ornament was used, toward the invention of original ornamental forms. In the Glasgow School of Art, 1896-1907, by Charles Rennie McIntosh (1868-1928), there is no element drawn from period styles. The austere masses of the walls and the large plain windows are combined, in the interiors, with an intricate rectilinear design of pillars and galleries which look forward to abstract geometric painting. The interior wall designs of the Cranston Tea Room in Buchanan Street, Glasgow, 1897-98, with their slim, hieratic figures, establish a link with the Viennese designers of the Sezzession, who subsequently invited McIntosh to Vienna, where he designed a Music Room for the founder of the Wiener Werkstätte. After McIntosh, British architecture, like American architecture generally after the Chicago Exhibition of 1893, fell back into a reaction against the new movements and a return to "neo" styles, while the most advanced work was being done by Austrian and German architects. The Viennese Joseph Hoffmann's (1870-1955) Connaught House at Purkersdorf, 1903-4, with its flat, unadorned lines, could easily be dated in the 20's, while his major work, the Palais Stoclet in Brussels, 1905, has the "streamlined" quality of the 30's. The Steiner House, 1910, in Vienna by Adolf Loos (1870-1933) could similarly be misdated. The older Viennese architect Otto Wagner (1841-1918), stimulated by the work of his followers, built the Post Office Savings Bank in Vienna in 1905, a building in which the structural facts of load-bearing vertical members and curtain wall (in this case a vaulted glass ceiling) are expressed with great visual clarity.

BEHRENS. The most important German architect of this period was Peter

Behrens (1868-1940), who expressed the reaction of the 1st decade of the 20th cent. against not only period styles but also the elaboration and the increasingly hothouse aestheticism of Art Nouveau, a reaction comparable in its seriousness and austerity to that of the cubist painters against the patterned decorativeness of the art of the 1890's. Behrens was influential not only through his buildings, such as the AEG Turbine Factory (Berlin, 1909), but through his emphasis on simplicity and excellence of design for all kinds of industrial products and through his effect on his disciples, among whom were 3 of the great architects of the century: Le Corbusier, Ludwig Mies Van der Rohe (1886-1969), and Walter Gropius (1883-1969).

THE BAUHAUS AND THE INTERNATIONAL STYLE. The work of Gropius before World War I (Fagus Factory, 1911; Model Factory for the Werkbund Exhibition, Cologne, 1914) developed the ideas of Behrens and established many of the principles of the 20th-cent. style—smooth lines, corners without visibly massive supports, walls of glass with only the slenderest of steel supporting beams—all adding up to a visual statement of technological mastery over new materials. In 1919 Gropius founded the Staatliche Bauhaus, a workshop and school, in which the style later christened by Alfred Barr as the "international style" was worked out not only in building (Gropius' Bauhaus at Dessau, 1925) but in typography, painting, and industrial design. The Bauhaus was the realization of William Morris' desire for high standards of design in ordinary objects, here enthusiastically applied to the products of the machine; and its style put a permanent mark on the 20th-cent. visual environment. Gropius' belief in anonymous group design and in the importance of relating architecture to actual social needs and problems (e.g., the importance of mass housing) were later adopted by the Architect's Co-operative which he founded in Cambridge, Mass.

MIES VAN DER ROHE. The director of the Bauhaus (at Dessau from 1930; moved to Berlin, 1932) until its closing under Hitler in 1933 was Mies Van der

Rohe, who had planned the Weissenhof Housing Exhibit of 1927 (including buildings by Gropius and Corbusier as well as by himself) in which models of future mass housing were displayed. His elegant Barcelona Pavilion, 1929—for which his famous Barcelona chairs were designed—was the prototype of the "glass box" which became so well known. Like Gropius, Mies went to America in the 1930's, and from his position at the Illinois Institute of Technology (whose building he designed, 1940) he influenced a whole generation of architects and designers. His spare, skeletal Seagram House in New York, 1955-58, is a recent example of his epigram, "less is more."

LE CORBUSIER. The 3rd of the great shapers of the 20th-cent. style was Le Corbusier, whose tremendous influence on architects has come not only from his buildings (Villa Savoye at Poissy, 1929-31; Swiss Pavilion at the Cité Universitaire of Paris, 1931-32, Unité d'Habitation at Marseilles, 1952; the Capital at Chandigarh, India, beginning 1950) but in his writings (*Vers Une Nouvelle Architecture*, 1923, *La Ville Radieuse*, 1925), in which he expressed his intense convictions about the classical purity of proportion in modern architecture and about the qualities of the machine as a model for architectural form. Le Corbusier, who was himself a Purist painter, is an outstanding example of the profound connection between the cubist and constructivist vision and that of the architects of the international style. Another example of this link is the Schröder House in Utrecht, Holland, built by Gerrit Rietveld (1888-1964) in 1923-24; Rietveld was a member of De Stijl, a group which grew out of cubism and included Mondrian and Van Doesburg, and the house, with its structure of lines and planes and lack of any fixed point of view from which to be observed, is a 3-dimensional translation of a De Stijl painting.

The most consistent exponent of the international style in the postwar world has been the firm of Skidmore, Owings, and Merrill, whose major designer is Gordon Bunschaft (b. 1909), but which has inherited the Gropius principles of group design. The Lever Building in New

York, 1950-52, was the 1st of a series of elegant glass office towers (Pepsi-Cola, Union Carbide, Chase Manhattan) that established the style (unfortunately often cheapened by its imitators) of American commercial building both at home and abroad.

EXPRESSIONISM. Expressionism in architecture is a rather vague term which can nevertheless be used to characterize those ideas and forms which stress sculptural shape and personal or organic feeling as opposed to an emphasis on rationality, technology, and objective geometrical proportion. It has its roots in the work of Gaudi; in the plans and drawings of the Italian Antonio Sant' Elia (1880-1916), whose Città Nuova project of 1914 aroused great interest; and in the work of Eric Mendelsohn (1887-1953) in Germany in the 20's (Schocken Department Store, Stuttgart, 1927). In the post-World War II period a reaction against the stringencies of the international style led to a renewal of expressionist feeling, even on the part of such creators of the classic style as Le Corbusier. Le Corbusier's Chapel of Notre-Dame du Haut at Ronchamp, 1950-54, with its swelling roof, fortresslike walls, and mysterious lighting from irregularly scattered windows, is a highly personal statement. So too is the soaring, sculptural TWA Building at Kennedy Airport, 1960, by Eero Saarinen (1910-61) the Finnish-American architect whose earlier General Motors Technical and Research Center (Warren, Mich., 1946-55) was a perfect Miesian glass box.

BRUTALISM. Brutalism is a term loosely derived from *béton brut*, or poured concrete, which is left with the rough cast marks of the wooden forms visible on the surface, and is therefore opposite in feeling to the smooth perfection of the glass curtain wall. Related qualities are the use of thick, massive forms, deeply inset fenestration, and a visual irregularity or complexity of structure such as that found in Paul Rudolph's (b. 1918) 'School of Art and Architecture at Yale University, 1964. Le Corbusier

again provides an example in his Maisons Jaoul at Neuilly, Paris, 1945-56. Another is the Richards Medical Research Building at the University of Pennsylvania, 1958-60, by the Estonian-born American Louis I. Kahn (b. 1901), whose powerful and unconventional personality has been, like Frank Lloyd Wright's earlier, an important influence on the generation of architects now coming to maturity. The work of the Finn, Alvar Aalto (b. 1898), is related to brutalism, though his use of native timber and brick in such buildings as the Technical College at Otaniemi, Finland, 1955, is more natural and organic than doctrinaire.

THE CONTEMPORARY INTERNATIONAL STYLE. It is, however, misleading to apply the term international style only to the classic modernism developed in the 1920's and 1930's, since the various more expressionistic postwar styles have also been international in scope. Because of its close link with modern technology and the abstract simplicity of its formal idiom, modern architecture has been relatively easily assimilated to a great many indigenous traditions, and important modern architects have emerged all over the world. An outstanding example of the fusion of traditional style with modern forms and methods is found in Japan, whose traditional architecture was itself an influence on modernism, particularly through the work of Frank Lloyd Wright. For example, Kenzo Tange (b. 1913), who belonged to a group of Bauhaus-trained architects in Tokyo in the 1930's, has built since the war a number of important buildings such as the Kurayoshi Town Hall, 1956, which uses form-marked concrete in a way that is both completely contemporary and reminiscent of the wooden temples of traditional Japan. Other outstanding examples of such assimilation of modern technology to indigenous traditions are the Ministry of Education and Health Building, Rio de Janeiro, the University of Mexico Library, Mexico City (with its mosaic decoration), and the Knesset, Jerusalem.
